If fault is not a proper factor in automobile accident reparations, why should fault be acceptable in any other tort situation? If a motorist should not be held liable for his momentary inadvertence why should a surgeon be held liable if his scalpel slips and injures a patient? Why should the distracted motorist who runs a stop light be exempt from tort liability when automobile manufacturers will be held liable if a workman's temporary distraction produces a faulty product that causes injury?

Simply stated, if the "basic principle" is true and motorists who injure others should not be held responsible for fair and adequate compensation, then the concept of fault should be discarded totally and each person should be required to protect himself not only from the consequences of his own conduct but from that of all others. It is clear that today's Americans are seeking a re-emphasis of individual responsibility, not its further erosion.

#### COMPULSORY ACCIDENT AND HEALTH INSURANCE

The AIA plan is compulsory accident and disability insurance for motorists, nothing more. Benefits payable under the plan (medical and hospital expenses, work loss and disability payments — per schedule) are available under present forms of non-auto, first party insurance coverages. If the plan were enacted, it would produce a unique situation. Motorists would be the only class in the United States who would be *forced* to purchase insurance to protect *themselves* from accidental injury.

Since most Americans have forms of non-auto insurance which provides for exactly the same losses that AIA's plan would cover, these persons would be *forced* to buy insurance they don't need.<sup>3</sup> If statistics on the amount of this non-auto, first party

<sup>3</sup>Statistics show that 85% of the American public have non-auto medical and hospital benefits available and that over 70% of the work force have wage continuation benefits available. Andre Maisonsieppe, A.M.I.A. vice-president, speech to Independent Mutual Insurance Agents of New York (Sept 1968)

insurance in effect are correct, nearly three quarters of the public would be *forced* to buy unneeded coverage and, as part of the bargain, to give up the right to recover for losses not covered by either their present insurance or the AIA plan.

One may wonder why AIA affirms an auto compensation plan which is, in effect, compulsory accident and disability insurance. One insurance executive has alleged that marketing factors are a prime reason.<sup>4</sup> He stated:

The AIA automobile insurance plan, being in itself simply a form of compulsory accident and disability insurance, lends itself from a marketing and procedural standpoint to a group approach. It seems fair to suggest that one motive strongly influencing members of the AIA Executive Committee, which are the giants in their own organization, is the marketing potential for tying their present group writings directly into the new automobile insurance system they propose.<sup>5</sup>

The AIA plan does not provide for a collateral source setoff, as in the Keeton-O'Connell plan, and the stated reason for not doing so is the belief that "the cost of motor vehicle accidents should be borne by motorists."<sup>6</sup> However, companies that will write the new auto plan and also continue to write other non-auto, first party accident and disability coverages will, in effect, be getting two premiums for the same coverage.

It should be noted that problems can arise in the enforcement of a compulsory insurance law. Since the purchase of its insurance would be a prerequisite to operating a motor vehicle in a state enacting the plan, some machinery would have to be set up to recover the drivers' licenses, certificates of registration and vehicle licenses of those motorists who allow their insurance to lapse.

#### LIMITATIONS ON RECOVERY

##### WORK LOSS

Under the present system, the innocent victim of an auto accident may recover full

<sup>4</sup>Kemper Insurance Reports, *Automobile Insurance: The Politics Of Surrender*, at 10 (Nov 1968); see also, *Insurance Today*, *The Journal of Commerce* (Nov 7, 1968)

<sup>5</sup>*Ibid*

<sup>6</sup>Note 1 *supra*

damages, including any wage loss he may suffer, present and future. The AIA plan places a ceiling on the recovery for this type of loss. A 15 percent "tax deduction" is subtracted from any amount payable for this benefit and the maximum recovery allowed is \$750 a month (\$9000 a year). The 15 percent deduction means that the most an injured person will be able to recover is 85 percent of his lost wages.

The \$750 a month restriction clearly discriminates against those who have earnings over \$9000 a year which includes over 30% of the population.<sup>7</sup> If inflationary pressures continue and the average wage and salary continue to grow, more and more people would not be fully compensated for wage loss due to the arbitrary limitation. It is easy to see why a limitation was set. One has to be fixed in any plan if initial cost figures are to be projected as lower than present rates.

#### LOSS OF EARNING CAPACITY

Under the present system, loss of earning capacity is a proper element of a personal injury claim. However, under the AIA plan, it appears that claims for loss of earning capacity will not be allowed since, "work loss" is defined as:

... loss of income from work (for example wages) and expenses reasonably incurred for services in lieu of those the injured person would have performed without income.<sup>8</sup>

If the plan intends to eliminate this element of recovery, a significant portion of the recoverable losses of some of the most seriously injured persons will be destroyed. For example, a college student could suffer a severe brain injury in an auto accident and have no wage loss because he is then unemployed. His brain injury could cripple him for life, making it impossible for him to accept employment but he would receive no payment for this calamity, except for a permanent disability payment computed as 50% of his medical and hospital bills. Under the present system, his potential for future earnings would be considered when determining damages.

As another example, a factory worker could be injured in an automobile acci-

dent which would force him to miss one month's work. He would receive his wage loss (less 15% and up to \$750) and his hospital and medical expenses. Although he could return to his prior job, his disability might disqualify him for better jobs at higher pay. Under the present system, his potential for assuming better positions prior to the accident would be a proper consideration in determining his damages. Under the AIA plan, his wage loss benefits would end once he returns to his former job and he would receive no payment although his disability made it impossible for him to better himself, except for a benefit computed at or up to 50% of his medical and hospital bills.

The failure of the AIA plan to consider any compensation for loss of earning capacity is another example of the fact that it is not a *complete* form of personal protection as its title claims.

#### ELIMINATION OF PAIN AND SUFFERING RECOVERY

The AIA plan would provide no recovery for the pain, suffering and inconvenience experienced by a person injured in an automobile accident. The reason is another of the "basic principles" used in developing the plan:

Pain and suffering are not susceptible of objective measurement and should not be included in a reparations system.<sup>9</sup>

It is not denied that injured persons endure pain, suffering and inconvenience but the injured would have to bear their burden because these elements of damage can't be computerized to provide a hard, fast formula applicable in all cases and regardless of individual human differences. The plan finds it easier to compute a payment based upon 50 percent of medical and hospital specials than to treat each claimant as an individual with pain and injuries distinct from other individuals — pain and suffering just don't compute so they are eliminated.

Recoveries for pain and suffering are presently allowed. In fact, a substantial portion of many personal injury awards is made up of compensation for that element of damages. Recognition is now made of the fact that persons may be forced to en-

<sup>7</sup>Statistical Abstract of the United States at 326 (1968 ed)

<sup>8</sup>Note 1 *supra* at 5

<sup>9</sup>*Id* at 3

dures pain, suffering and inconvenience through no fault of their own and that, but for the carelessness of another individual, they would not have had to undergo that ordeal. The basic principle applies that a person who causes injury to another should be responsible for seeing to it that the injured person is fairly and adequately compensated. Anguish and inconvenience are now considered as much a part of that injury as the lacerated skin, torn muscles and broken bones. The vast sums our population spends on drugs, medical research, hospitals and doctors illustrates our dread of pain and shows that we will go to great expense to prevent or relieve it.

Also recognized is the concept that pain and suffering include much more than the actual physical hurt produced by the injury. A person with a broken limb is forced to endure discomfort and inconvenience as long as, and sometimes after, the bones mend and the actual physical hurt ceases. A person whose face is so scarred that plastic surgery can never fully succeed will suffer anguish and humiliation for the rest of his life. A young woman whose injury prevents her from ever bearing a child may suffer emotional anguish long after her wounds have ceased causing her physical pain.

The present system does not pretend to set an exact value on a quantum of pain so it can be multiplied by the claimant's total time exposed to that experience. No two human beings are alike, and it is logical to say that no two human beings experience pain to the same degree. Pain and suffering are not commodities available in the marketplace. They have no going hourly rate as do the wages of workmen.

Today, the trier of fact is given the responsibility to award the plaintiff a sum thought reasonable for the total experience of pain and suffering he has undergone.

Insurance statistics show that about 98 percent of all auto claims are settled and that only 2 percent are ever determined through a full trial.<sup>10</sup> Since so many cases are settled involving claims for pain and suffering, it indeed seems strange to suggest that a reasonable settlement for pain and suffering cannot be reached. This is exactly what the companies that write auto

insurance have been doing with claimants for many years and are still doing today.

That settlements and verdicts which include sums for pain and suffering do not have a precise mathematical formula is to the credit of the present system. A jury considers all the evidence presented to determine the plaintiff's injury and the pain, suffering and inconvenience he was forced to undergo. The greatness of the system is that it allows individuals to be treated as individuals and allows human beings to assess the injury suffered by human beings. The fact that the pain and suffering caused one individual by another does not work into a computer program should not be allowed to determine whether an injured person will be denied his right to recover for that damage — unless a computer can also prevent one from ever suffering pain again. Forms of first party coverages are no substitute for compensation for pain and suffering.

#### REDUCED DISABILITY BENEFITS

The AIA plan does recognize that, in some cases, a person may be partially or totally disabled by an auto accident and does attempt to provide a small benefit as "compensation" for that disability.

Under the present system, the trier of fact considers all the evidence presented on the issue of the plaintiff's disability and determines a reasonable award for that damage. Under the AIA plan the only individual consideration given to a disabled claimant will be the total of his medical and hospital expenses. This amount will be multiplied by a fixed figure up to fifty percent. The extent and nature of the disability will not be considered. In fact, the individual himself will not be considered. All that will matter are figures and decimal points on the hospital and doctor bills.

For example, a young secretary who lost a leg in an auto accident will be told: "We paid your medical and hospital expenses and your lost wages while you were away from work. Your wheel chair will fit behind a typewriter. But, since you are permanently disabled, we'll also give you an extra 50% of your medical and hospital bills. This will make up for the fact that you can't swim or dance, or engage in any of the other activities young girls of your age enjoy."

<sup>10</sup>*Fact vs. Fiction*, at 4, National Association of Independent Insurers (1968)

Such a plan will also "care for" the young father who loses his arms in an auto accident. Under its rehabilitation program he may even be fitted with artificial arms so that he can again perform the tasks expected by his employer. But, will an additional 50% of the value of medical and hospital bills compensate him for his inability to teach his son to throw a football? Will it provide just compensation for the impairment of his ability to fully enjoy life?

The protection of the AIA plan is not as complete as the title suggests. It does not consider the fact that a person suffering from a severe, permanent disability may have relatively small hospital bills and medical expenses and that this would reduce the amount of the award. It is based on an easily calculated formula which treats each claimant as a computer entry rather than an individual.

#### PROPERTY DAMAGE LIMITATION

The AIA plan presents a unique approach to liability for property damage. Today's motorist is liable for damage he may cause to the property of others because of negligence. Insurance coverage for such property damage is a standard part of automobile policies. In addition, first party insurance coverages are provided to cover loss to one's own auto which would otherwise go uncompensated.

Under the plan, owners of property other than motor vehicles would be treated as additional insureds under a motorist's policy. If, for example, a driver left the road and struck and damaged a person's home, the driver's insurer would pay the homeowner for that damage. However, if the driver would strike a car parked in front of the owner's home, the plan gives the driver and his insurer immunity from any liability. All vehicle owners in a state enacting the plan would assume the risk of damage to their own vehicles. Thus, even if the owner could conclusively prove that his car was properly parked and that the damage was caused by another's negligence, he would have no right to be reimbursed.

Such a change in the rules of liability might be welcomed by parking lot operators and the owners of vehicles that are one step away from the junk yard. However, it would be unjust and inequitable

for scores of responsible motorists who use every means to avoid damaging the property of others and to assure that their own vehicles are in good condition.

AIA indicates that, under their plan, all insurers would be required to offer a form of "physical damage coverage" (presumably similar to present forms of collision and comprehensive coverages). It should be noted that this coverage would be optional and that an additional premium would be charged to those who wished it.

#### *Misunderstanding As To Need For Coverage*

If the plan were enacted, it is questionable whether motorists would be sufficiently informed about its features to recognize the need to acquire the additional physical damage coverage. Most motorists do not consider their auto insurance as a group of separate coverages for which separate premiums are paid. They tend to view all coverages as an indivisible whole for which a single premium is charged. It is reasonable that many would view the claimed 45 percent premium savings under its new plan as a saving that would be realized against the price now paid for a complete auto insurance package — including collision and comprehensive coverages. This view is strengthened by newspaper over-emphasis on the claim of 45 percent cost savings. Few have mentioned that only 19 percent savings are claimed if physical damage coverage is also added. Expecting a 45 percent saving, motorists might mistakenly purchase only the bare bones AIA coverage and not the additional physical damage option. Thus they would be exposed to severe financial loss in case of subsequent damage to their autos.

#### *Inequity In A Deductible*

One must also consider the fact that the plan's physical damage coverage would certainly have some form of a deductible. The most common deductibles with present collision coverages are \$50 or \$100. However, under the present system, a vehicle owner may recover the \$50 or \$100 he paid for the cost of repair, if the damage was caused by another's negligence.

This would not be so under the AIA plan. Those causing property damage to the vehicles of others would be immune from liability. Up to the limit of the de-

ductible, the vehicle owners would be self-insurers for damage caused by other drivers. Therefore, if a person parked his car in front of his home and it was struck by a vehicle operated by a drunk, the owner would have to pay the first \$50 or \$100 of repair bills. If he failed to purchase physical damage coverage he would have to pay the full repair bill himself. The drunk would have no liability whatsoever.

#### *Elimination Of Individual Responsibility*

It should be clear that elimination of tort liability for damage caused to the automobiles of others may seriously affect the attitude of some motorists toward traffic safety. Since all motorists would be responsible for damage to their own vehicles and tort liability would be completely eliminated, persons driving loaned vehicles or very old autos of minimal value would have no incentive to avoid the slight scrapes and bumps with other vehicles that may occur while driving on congested city streets or while parking. It may give some motorists an opportunity to vent their anger on others whose driving habits they don't condone. For example, the driver of an old, dilapidated auto, cut off at a stop sign by an expensive late-model foreign car, could catch up with his antagonist at the next stop sign and give him a good jolt with his bumper. If the new car suffered property damage as a result of the incident or if one of its occupants suffered personal injury, the driver of the old auto would not have to pay since all tort liability is eliminated.

#### CLAIMS OF REDUCED COST

It is important to study the details of the AIA proposal to adequately analyze its claimed savings in rates. In the brochure which describes the no-fault plan, the following statement is made concerning its cost saving estimates:

It should be noted that the indicated savings are amounts by which premium for private passenger automobile insurance could be fully reduced from *adequate* present rates.<sup>11</sup> (Emphasis added)

Statements made by AIA officials during recent Congressional hearings on the Department of Transportation study of auto reparations indicate that they do not con-

sider present rates to be adequate.<sup>12</sup> Therefore, it is important to know how great an increase in present rates would be needed to make them *adequate*.

An indication of how much of an increase would be needed came at the press conference called by AIA to announce its new plan. Under questioning by reporters, an AIA official said that today's rates are 10 to 15 percent inadequate in most states.<sup>13</sup> This places the claims of cost savings in a different perspective. For example, if a person is presently paying \$100 for his auto insurance an *adequate* rate would be between \$110 and \$115. Under AIA's new plan any rate reduction would be from such increased premium figures. In this example, if a 19% saving were in fact realized, the policyholder who is now paying \$100 for his insurance would end up paying between \$89.10 and \$93.15 for his insurance. His actual savings over his present rates would be between 10.0 and 6.85 percent. It should be noted that the average American motorist is presently paying much less than \$100 a year for his insurance.<sup>14</sup> Therefore, savings for the average American motorist, if the plan were enacted and actually produced savings, would be very very small.

#### WILL COST REDUCTIONS MATERIALIZE?

Since the AIA plan is not in effect, opinions as to the cost of that plan once it is in operation are at best estimates. Actuarial studies must be projected on present data. It is of paramount importance to consider the plan's cost study to determine its validity as well as the assumptions accepted by them to establish its cost analysis.

An actuarial analysis of the AIA study revealed the following:<sup>15</sup>

1. In costing out its compulsory accident and disability plan, the AIA

<sup>12</sup>Hearings Before the Commerce Subcom of the Senate Com on Commerce on SJ Res 129 at 120-63 (Mar 14, 1968)

<sup>13</sup>Wise, *Automobile Insurance: Which Road Toward Reform?* American Mutual Insurance Alliance Pamphlet (Nov 20, 1968)

<sup>14</sup>U.S. News & World Report (July 9, 1968)

<sup>15</sup>Note 13 *supra*; we have been advised that the National Association of Independent Insurers has also been studying the cost figures used to develop the AIA plan and that NAI's study, to date, indicates that the plan would produce no savings in average premium charges. If anything, the plan would probably increase premiums.

<sup>11</sup>Note 1 *supra* at 8

study committee assumed that only 31 percent of persons injured in auto accidents would be entitled to payment for wage losses. However, the AIA's own cost survey shows that more than 43 percent of traffic accident victims actually incur wage losses.

2. The AIA's cost estimates make no allowance for future income losses to survivors in auto accidents where the breadwinner is killed. In costing out their plan, they list only the economic losses incurred up to the time of death. Our actuaries estimate that, on a conservative basis, this error alone will add more than 16 percent to the economic losses under the AIA proposal.
3. The AIA's cost estimates make no provision for wage losses in cases that result in partial disability — that is, where a worker had to take a lower-paying job because of an impairment suffered in an auto accident.
4. The AIA's cost estimates arbitrarily list all cases of permanent and total disability as the equivalent of 99 weeks of disability — less than 2 years. This arbitrary assumption has the effect of grossly understating the actual economic losses that would be incurred in such cases.
5. The AIA's cost estimates do not include any provision for payment of cases that fall into the assigned-case plan. Yet we know that such cases will add substantially to the financial cost of their proposal, especially in states where there is heavy out-of-state traffic.

It should be clear that the cost estimates are subject to serious question and that the plan may well turn out to be more expensive than presently projected.

There are other unanswered questions which must be considered, the answers to which may also adversely affect hopes of cost savings:

1. The plan contemplates paying all persons injured in auto accidents. This includes those who do not recover because of their contributory negligence, those involved in one-car accidents and those who have claims that are so small that they

do not care to prosecute them. Is sufficient data available to accurately determine the impact that the payment of all these additional claims will have upon the cost?

2. Will the elimination of the fault concept adversely affect highway safety programs, with the result that there will be more accidents and claims?
3. Since there is no deductible on the medical and hospital expense portion of the plan, will many persons with very minor injuries which do not usually require medical attention seek out medical services?
4. Will many persons attempt to pad their claims by obtaining excessive or unnecessary medical and hospital treatment or by unnecessarily remaining away from work? What effect will the limitation of the plan to out-of-pocket benefits have as an inducement to padding of claims?
5. If the AIA plan follows the proposal of the Keeton-O'Connell plan to provide benefits for all injuries arising out of the ownership, maintenance or use of motor vehicles, would a problem with fraudulent claims arise? Would persons injured in non-auto accidents claim that they suffered injury while repairing or servicing their vehicles to gain benefits under the plan? Would a substantial number of these unwitnessed "auto" accidents affect the projected cost?
6. How many disputes between insurers and their insureds over benefits under the plan will result in court suits? Would a substantial number of these suits increase the cost?
7. Would a larger claims department clerical staff be necessary to handle the periodic payments method of the plan and the necessary paperwork this would entail? What changes in the claims staff personnel would be needed to investigate whether the insured had completed medical and hospital treatment, was able to return to work, etc.? What effect will these items have upon costs?
8. What will it cost insurers to train personnel, establish new procedures,

issue new policies, etc., for the new plan? Will this cost be passed on to policyholders?

9. The plan contemplates payments for services the injured person would have performed had he not been injured. This would pay for items such as hiring a housekeeper to do housework for an injured housewife. How many claimants will "milk" this benefit by hiring outside help to do work they actually could perform themselves or by keeping a person on to do this work long after the disability has ceased? What effect will a substantial number of these situations have upon costs?
10. AIA has indicated that the size of the benefits payable for wage loss or disability and disfigurement could be increased if the legislature of a state enacting the plan would so desire. However, it should be clear that if they were to be increased, the size of the premiums paid would also increase. Is sufficient data available so that the impact of any increases in these benefits on the plan's cost could be adequately evaluated?

While the product's cost is an important factor, a consumer is also concerned with what he gets for his money. A person might choose one pair of shoes over another even though the cost is 20 percent more, simply because he knows the cheaper pair will fall apart quickly. A cheap product is not always a "bargain."

To the innocent victim of an automobile accident the AIA plan would surely not be a bargain even if it could be sold for 19% or 45% less than present insurance. He would be required to give up too much.

#### WHO WOULD PAY HIGHEST RATES?

In evaluating the AIA proposal a significant factor is the possibility of changed rating structures. That is, who would pay the highest rates under the plan and who would pay the lowest?

Under the present system the insurer pays damages if its insured is found legally liable for the injuries and damages caused by the auto accident. Therefore, the insurance rates charged to insureds, under the

present system reflect the insured's potential for causing injury and damages to others. The driver who has the highest accident and traffic violation record and greatest potential for causing injury and damage pays the highest rate. The driver with no record of accidents and traffic violations and with the lowest potential for causing injury and damage pays the lowest rate. Drivers whose records fall between these poles have their rates adjusted accordingly. Since the present system operates on a third party, liability insurance contract, this type of rating structure is equitable.

Unlike the present system, the AIA proposal envisions a first party contract which, as to the exposure of the insurer, is more similar to life or accident and health insurance. In structuring rates under a first party system, the insurer is concerned solely with the possibility of loss to its insured and not with the losses the insured may cause others. For example, if two persons apply for an identical life insurance policy and the only difference between them is that one has a severe heart condition while the other is in perfect health, the one with heart trouble pays a higher premium because he is the greater risk. Similarly, if two persons take out the same medical and hospital insurance plan, but one covers only himself while the other also covers his wife and children, the person with the family coverage pays more. Again, the insurer's exposure is greater in one case than the other and justifies a higher rate.

Logically, the AIA plan must have a similar rating structure. Thus, the person expected to collect the most in case of an accident would have to be charged a higher rate than the person who would collect little. Therefore, the owner of a station wagon who has a large family would pay higher rates than an unemployed student with a two-seat sports car. If there were a collision between these two vehicles, the insurer covering the station wagon would have the potential of a claim for work loss and disability by the owner and, in addition, claims for medical and hospital expenses by all in the car. The insurer of the sports car would face a possible claim for only medical and hospital expenses by the driver — and possibly a claim by one other passenger.

In this situation the fact that the driver of the sports car has a bad traffic violation

record would have less impact on rates under the AIA plan than under the present system. With fault eliminated, the sports car driver could violate a red light, kill all the passengers of a fully loaded bus and his insurer would have no worry unless it also insured the bus since the insurer of a vehicle only pays benefits to the occupants of that vehicle and has no concern with its insured's recklessness as it relates to the passengers of other vehicles.

Under the AIA plan, it is logical that some who have poor driving records could demand lower rates than motorists with large cars and families. If fault is no longer a proper factor in an auto reparations system, this principle should also be applied to rating. It would be illogical for an insurer to charge high rates to *its own insured* because he causes *other insurance companies* to pay a great deal of benefits to *their insureds*.

In evaluating the plan it is also important to consider its impact upon commercial vehicle owners who now pay some of the highest insurance rates. Since commercial vehicles use roads and highways constantly, their insurers recognize a high loss potential. These drivers are not, as a class, incompetent. Their actual time on the road exposes them to more potential accident involvement and insurers recognize that their liability potential for injury and damages is also great.

However, when rating commercial vehicle insurance, the AIA plan recognizes that the concepts of the present system would not apply:

Since . . . the plan recommended by the committee contemplates essentially that the motorist be responsible for people in his own car, it is clear that commercial vehicles (except public carrying vehicles) will have little exposure because of the absence of family and guests in commercial vehicles. Accordingly, the present cost borne by commercial vehicles will be shifted to some extent to private passenger vehicles.<sup>16</sup>

AIA officials have indicated a possible shifting of some costs back to commercial vehicles once the plan is adopted. This would be illogical and a step which the owners of commercial vehicles could justifiably oppose since under the plan each

person should insure those who occupy his vehicle from loss. Therefore, the insurers of commercial vehicles should not be concerned with the losses that their drivers cause to others, only losses to themselves. A commercial insurer would be hard pressed to justify charging a higher rate to the owner of a truck fleet because *other* insurers had to pay great amounts in benefits to persons injured by the truck drivers. Since it is a first party system, each person should care for himself.

## POSSIBLE REDUCTION OF AUTO LITIGATION

### PLAN AS SOURCE OF LITIGATION

It is clear that the AIA plan will not eliminate all litigation resulting from automobile accidents. However, it is important to consider whether the plan would reduce these lawsuits. It is not claimed that the plan would do away with all auto-tort suits. In fact, the plan provides for residual liability actions and insurance to cover that liability.<sup>17</sup> Countrywide adoption of the plan should result in the abolition of residual liability.

However, even with residual liability eliminated, it is recognized that claimants and insurers will not always agree on interpretation of the plan's provisions or the amount of benefits. Therefore, the plan provides that the jury trial will be retained to resolve these disputes.<sup>18</sup> Regarding reduction of auto accident litigation, the question then becomes whether the litigation involving disputes between claimants and insurers will produce more court cases than now.

Current statistics show that 94 percent of all auto claims are settled without lawsuits being filed and that another four percent are settled without the suit being tried to a verdict.<sup>19</sup> The plan would have to produce a better record than this before a reduction in auto accident litigation could be claimed. Since the AIA proposal is not in operation, there are no statistics available to accurately compare its operation and the present system. However, since the plan contemplates paying benefits to all persons injured in auto accidents, it is unquestioned that there will be more

<sup>16</sup>Note 1 *supra* at 9

<sup>17</sup>*Id.* at 6

<sup>18</sup>*Ibid.*

<sup>19</sup>Note 10 *supra*

claims than now. Persons who can not recover now because of fault will be able to gain limited benefits. Estimates as to the increase in claims under a no-fault auto system vary between 40 and 63 percent.<sup>20</sup> This claims increase will cause a greater number of disputes, based upon interpretation of the plan's provisions or its benefits.

Types of disputes that may result under the AIA proposal should be considered:

1. Regarding hospital and medical expenses, the proposal speaks of paying "reasonable charges for reasonably necessary products and services."<sup>21</sup> Thus, two questions will arise with every claim submitted: a) are the charges reasonable? and, b) were the services or products necessary? Here, disputes may arise between claimant and insurer. Did the claimant really need the doctor's care that long? Was such a lengthy stay in the hospital necessary? Were all drugs, braces and treatments needed? Were costs of these items reasonable? If the claimant and insurer can not agree, "reasonableness" will be a question for a jury.
2. As to benefits for "work loss" the proposal speaks of paying "for loss of income from work (for example, wages) and expenses reasonably incurred for services in lieu of those the injured person would have performed without income."<sup>22</sup> Here again, disputes may arise. Did the claimant have to stay away from work so long? Was the hiring of household help necessary? If it was necessary, was it needed for so long? Would the injured person have performed the services if he had not been injured? Were the charges for the services reasonable? Once again, a jury will have to decide what was "reasonable" in case of disagreement.
3. The plan recommends that an additional benefit be paid for permanent disability or disfigurement and that it be limited to a maximum of 50 percent of medical and hospital expenses. The proposal states that the

actual amount of this benefit will "vary according to the degree of impairment or disfigurement."<sup>23</sup> Here again, disputes may arise. Is the claimant totally disabled so that the 50% rate should be used, or should some other percentage be used? If he is not totally disabled, how is the percentage determined? Is a small scar on a young girl's face worth a 50% rate? Should the percentage be computed on the medical and hospital bills as submitted, or should they be reduced because some of the charges are unreasonable or the services unnecessary? Again, if disputes arise, a jury will decide what is "reasonable."

The percentage of claims that would result in litigation is a matter of conjecture. Since under the AIA proposal persons injured in auto accidents will be asked to endure pain and suffering, the loss of earning capacity, and disability without just compensation, it can be expected that claimants will seek every last penny they think they have coming from their insurer. The sum the claimant may believe is rightly due him and the sum the insurer believes it should pay may be quite different.

Claims that the nature of a no-fault compensation plan will reduce litigation can not be accepted at face value. The same claim was made for workmen's compensation. The AIA plan would be similar to workmen's compensation in that its prime concern is the amount of benefits an injured person has coming.

A 1966 study of Texas trial courts showed that eight times more workmen's compensation claims resulted in court suits than did auto liability claims.<sup>24</sup>

#### POSSIBLE INCREASE FOR PRODUCTS SUITS

Since a claimant under the AIA plan has no right to recover for his pain, suffering, inconvenience or loss of earning capacity and has a right to only minimal benefits for disability, there is a possibility that his attorney would suggest litigation against third parties. The plan prevents one of its insureds from suing another for tort liability, but it says nothing about the right to bring a products suit against the manufacturer of the product involved in the

<sup>20</sup>Harwayne, *The Answer To The Plan's Low Cost*, 3 Trial 47 (No. 6, Oct/Nov 1967)

<sup>21</sup>Note 1 *supra* at 5

<sup>22</sup>*Ibid*

<sup>23</sup>*Ibid*

<sup>24</sup>Note 10 *supra* at 6

accident or against the persons who sold them. Members of the organized plaintiffs' bar have suggested that a claimant's counsel should always consider the possibility of such a products suit in every auto collision case.<sup>25</sup>

While courts have been reluctant to rule that a manufacturer must produce a product that is accident-proof, they may change their position if the AIA plan abolished usual forms of tort liability. It is clear that the plaintiffs' bar is committed to establishing the principle that a manufacturer should be held to insure the absolute safety of its product. The end result of the adoption of the AIA plan may well be the replacement of the normal auto-tort action with one for product liability.

#### THE PLAN'S QUESTIONABLE CONSTITUTIONALITY

There is little doubt that a plan which would severely limit the damages recoverable by the innocent victims of traffic accidents would be subject to having its constitutionality challenged. The AIA proposal states the following:

Most lawyers and legal scholars believe that in today's constitutional climate the courts would be loathe to strike down legislative enactments providing a comprehensive no-fault automobile accident reparations system.<sup>26</sup>

Such a broad, sweeping statement would seem to require a great deal of amplification and documentation. It is questionable whether *most* lawyers and legal scholars have even considered the problem. A reading of the proposal indicates no research on the subject but a total reliance upon the analysis of the constitutional problems confronting the Keeton-O'Connell plan, as set forth by its authors.<sup>27</sup> The situation should be more carefully examined to determine whether constitutional obstacles will be as easily overcome as is believed.

#### DUE PROCESS

The Fourteenth Amendment to the United States Constitution prohibits a state from depriving a person of life, lib-

erty or property, without due process of law. This prohibition has a counterpart in many state constitutions through provisions which guarantee a legal remedy for all injuries.<sup>28</sup> Because of such prohibitions, there is abundant authority for the premise that a state may not completely abolish a cause of action for injuries without substituting another adequate remedy.<sup>29</sup> Proponents of the Keeton-O'Connell plan may argue that the plan will have no trouble in this respect, since it does not abolish all tort remedies. Since the AIA plan would eliminate all tort actions, it must be shown that this scheme substitutes an adequate remedy.

It will undoubtedly be argued that the system of private, first-party insurance envisioned would be an adequate substitute for the tort remedies which would be abolished by statute. Here, there would be strong grounds for disagreement.

Regarding motor vehicle damage, under the AIA scheme there would be no replacement of the existing tort remedy. Under the present system, if a motor vehicle is damaged by the negligence of a third party, its owner may bring a tort action against the negligent person to recover damages. The AIA proposal would absolve the negligent motorist of all liability to other owners' vehicles damaged by careless conduct and each vehicle owner would be forced to assume the responsibility for damage to his vehicle. Under the proposal all insurers would be required to offer a form of non-compulsory collision coverage. This could hardly be considered an adequate replacement for the existing tort remedy which would be abolished. As was previously discussed, even with the collision coverage, the motorist himself would have to pay for protection of his property from the negligence of others and, that protection would not be complete.

<sup>25</sup>For example, the Wisconsin Constitution, Article I § 9 provides:

Every person is entitled to a certain remedy in the laws for all injuries, or wrongs which he may receive in his person, property, or character; he ought to obtain justice freely, and without being obliged to purchase it, completely and without denial, promptly and without delay, conformably to the laws.

The words "conformably to the laws" have been held to have the same meaning as "due process of law." *McCoy v. Kenosha County*, 218 NW 348 (Wis 1928).

<sup>29</sup>Ruben & Williams, *The Constitutionality of Basic Protection*, 1 Conn L Rev 44, 46 (1968).

<sup>26</sup>DR1, *Special Bulletin No 6* (Apr 1967).

<sup>27</sup>Note 1 *supra* at 9.

<sup>28</sup>*Ibid*, citing Keeton & O'Connell, *Basic Protection For The Traffic Victim*, Ch 9 (1965).

It is also questionable whether the plan's first party insurance would be considered an adequate substitute for present tort reparations for personal injuries. Here again, the question of adequacy would logically be judged against the remedy innocent victims of auto accidents now have available to them — the remedy which the new plan would completely abolish.

Under the present system a person injured through the carelessness of another may pursue his right to collect damages from the person who injured him. If the injured person has a valid claim, his damages are paid by the person who injured him (or from insurance coverage which the tortfeasor paid premiums to create). Under the new proposal, a person must buy insurance protection for himself to recover some benefits if another person negligently injured him. The change would result in a shift of responsibility from the person causing injury (the present system) to the person who is injured. A court would have to engage in fancy semantic juggling to hold that this is, in fact, a "remedy."

Even if a court could stretch its imagination to a point where it could consider the AIA proposal as a substitute remedy for the present system, the question would remain as to whether the remedy is an *adequate* substitute. Again, it is logical to judge adequacy against the type of remedy innocent victims of auto accidents presently have available.

Under the present system, a person who is entitled to recover damages for injury caused by negligence of another has the right to recover medical and hospital expenses; loss of wages; loss of earning capacity; and payment for disfigurement, disability, pain and suffering — all limited only by the actual extent of his loss. He need not make any payment or buy any insurance to recover. Under the AIA plan payment would be made for medical and hospital expenses (limited to semi-private room expense); limited wage loss; and limited disfigurement and disability loss.

There would be no recovery for lost earning capacity or pain and suffering. All motorists would be required to buy insurance in order to recover these limited benefits, whether or not other insurance coverages they enjoy would be duplicated. The fact that many motorists would be re-

quired to buy insurance which would duplicate coverages they possess from other sources raises the question as to whether this compulsion deprives them of property without due process.

Any objective analysis shows that the AIA plan would not offer adequate substitutes for remedies now available to innocent victims of auto accidents and would, therefore, violate the Due Process Clause.

#### EQUAL PROTECTION

The Fourteenth Amendment to the United States Constitution also provides that no state may deny any person within its jurisdiction equal protection of the laws. The Keeton-O'Connell plan would be challenged here because it only allows tort actions by persons whose out-of-pocket loss exceeds \$10,000 or whose pain and suffering is valued at over \$5000. Keeton and O'Connell consider this problem in their book.<sup>30</sup> A different situation is presented under the AIA plan, and the Keeton-O'Connell arguments would not be applicable even if they were valid.

The Equal Protection question relating to the AIA proposal would be whether its classifications unconstitutionally discriminate against any class of persons. Three areas of classification in the plan are of immediate concern:

- 1) The limitation of recovery for work loss to \$750 a month which would only partially compensate those who earn more.
- 2) The allowance of recovery for property damage to owners of all property, except motor vehicles.
- 3) The determination of the allowance for disability and disfigurement based upon the size of medical and hospital bills and not upon the nature and extent of injury which, in many cases, would cause a person with severe disability or disfigurement to recover less than one who is less seriously injured.

Under an Equal Protection attack, the test of a state's establishment of such classifications is whether they rest on grounds wholly irrelevant to the achievement of the state's objective. A statutory

<sup>30</sup>Keeton & O'Connell, note 27 *supra* at 491

discrimination will not be set aside if any facts reasonably may be conceived to justify the classifications.<sup>31</sup> The Supreme Court has stated:

[T]he law need not be in every respect logically consistent with its aims to be constitutional. It is enough that there is an evil at hand for correction, and that it might be thought that the particular legislative measure was a rational way to correct it.<sup>32</sup>

Under such a test, it is difficult to see any logical reason why innocent owners of vehicles should be treated differently than other property owners. It is also difficult to muster a logical reason, other than ease of mathematical determination, for computing a benefit for disability or disfigurement on a percentage of hospital and medical expenses rather than on the nature and extent of the injury itself. As to the classification for wage loss, it is easy to see why a limit was set. To allow unlimited wage loss recovery would mean higher premium costs for the insurance plan. Any limited benefit plan must be sold on its low cost.

It appears that the AIA plan limitations are arbitrary and subject to serious constitutional challenge under the Equal Protection Clause.

#### WORKMEN'S COMPENSATION ANALOGY

Proponents of no-fault auto compensation plans argue that if workmen's compensation laws were held constitutional, a no-fault auto plan should be treated similarly:

If a proposal is sound and in the public interest, constitutional obstacles will be overcome as they were for similar reasons when workmen's compensation laws were enacted.<sup>33</sup>

Keeton and O'Connell pursued the same thought regarding constitutional objection to their plan; however, theirs was a more circuitous route. They first observed that the proponents of the Columbia plan believed their proposal to be constitutional. Then, Keeton and O'Connell observed that workmen's compensation laws were held constitutional. Finally, they con-

cluded that since the Columbia plan and workmen's compensation were more radical departures from tort remedies than their "Basic Protection" plan, a fortiori their plan must be constitutional.<sup>34</sup> While such a bootstrap operation in instant constitutionality presents an interesting exercise in logic, it is not persuasive.

The position that constitutional obstacles to the AIA plan will be overcome for the same reasons that they were with workmen's compensation laws is untenable. Do the same or similar problems exist in the area of auto reparations as existed at the time workmen's compensation laws were developed? One author has described the conditions existing in the early 1900's which brought about workmen's laws as follows:

The industrial accident rate in this country at that time was more than double that of the United Kingdom, France and Germany. Yet injured workers were typically unable to obtain compensation for their injuries. Dismissal and black-listing were powerful deterrents to bringing an employer into court. Even if a workman or his widow did institute suit, the fellow servant rule and the doctrines of contributory negligence and assumption of risk made the prospects of recovery exceedingly remote.

Such conditions could not pass unnoticed, and the outcries of politicians, labor leaders and popular writers lead to an instant demand for reform.<sup>35</sup>

While there are problems in the operation of the present auto reparations system, analysis shows that they do not approach the magnitude of those involving employee accident reparations at the beginning of this century. In fact, the major problems in the auto reparations field lie in the areas of marketing, underwriting and the cost of insurance, not the manner in which persons injured in auto accidents recover compensation.

Regarding auto accident reparations, there are marked dissimilarities to the problems which brought about workmen's compensation laws. Although some critics of the present system claim that its payments are slow and that auto cases clog the courts, statistical analyses have refuted

<sup>31</sup>Note 29 *supra* at 48

<sup>32</sup>*Williamson v. Lee Optical of Okla.*, 348 US 483, 488 (1955)

<sup>33</sup>Note 1 *supra* at 9

<sup>34</sup>Keeton & O'Connell, note 27 *supra* at 484

<sup>35</sup>Note 29 *supra* at 52

that claim. The facts show that court congestion exists in only a small number of jurisdictions and is not caused by auto cases and that most auto cases are settled promptly and without the necessity of court suit.<sup>36</sup> It should also be noted that the majority of Americans have first party insurance coverages which pay hospital and medical expenses and wage loss without regard to fault. Families in the United States are protected by roughly 800 billion dollars worth of life insurance and Social Security coverage is extensive.<sup>37</sup> In all but two jurisdictions uninsured motorist coverage is mandatory or must at least be offered to an insured, or an unsatisfied judgment fund exists.<sup>38</sup> Medical payments coverage providing benefits without regard to fault may be purchased if the insured desires that protection. Insurance companies are engaging in advance payments and open-end release techniques which bring needed money to persons injured in auto accidents promptly. Finally, the development of the contingent fee system allows even the most destitute claimant to have his claim prosecuted by well-trained, competent counsel. Thus, persons injured in auto accidents do not share the same plight as injured workmen of the early 1900's whose chances of receiving compensation were at least remote.

Another important distinction between a no-fault auto reparations system and workmen's compensation can be illustrated by the following quotation from the Supreme Court decision which upheld the constitutionality of the New York Workmen's Compensation Law:

[T]here is the loss of earning power; a loss of that which stands to the employee as his capital in trade. This is a loss arising out of the business, and, however it may be charged up, is an expense of the operation, as truly as the cost of repairing broken machinery or any other

expense that ordinarily is paid by the employer. Who is to bear the charge? It is plain that, on grounds of natural justice, it is not unreasonable for the State, while relieving the employer from responsibility for damages measured by common-law standards and payable in cases where he or those for whose conduct he is answerable are found to be at fault, to require him to contribute a reasonable amount, and according to a reasonable and definite scale, by way of compensation for the loss of earning power incurred in the common enterprise, irrespective of the question of negligence, instead of leaving the entire loss to rest where it may chance to fall — that is, upon the injured employee or his dependents.<sup>39</sup>

While it may be easy to agree with the court that natural justice would support a plan by which an employer is required to provide compensation for the injuries employees suffer as a natural hazard of employment, it would be strange indeed to argue that it is natural justice to absolve tortfeasors of all liability and force the persons they injure to expend their own funds to insure that limited compensation will be available. An analogy to workmen's compensation must be strained beyond all bounds to make it apply to auto accident reparations and proposed no-fault compensation plans.

It does not appear that the constitutional hurdles would be as easily crossed. Even Keeton and O'Connell admit that their plan would be unconstitutional in those states in which there is a constitutional ban against limiting the amount recoverable for personal injuries or death.<sup>40</sup>

#### COMPLICATIONS AFTER ENACTMENT

The enactment of a no-fault auto compensation plan would create a serious problem if it were later found unconstitutional. It is possible that the constitutionality of such a plan may not be challenged until long after it becomes law. If such were the case, the problems created by a finding of unconstitutionality would be massive. Once a plan was enacted the insurance industry would have to reorganize — new policies would have to be devised, printed and dis-

<sup>36</sup>Note 10 *supra*; see also, *Court Delay And The Auto Accident Claim*, 7 For The Defense 58 (Oct 1966); *Court Congestion — A Localized Urban Problem*, 8 For The Defense 49 (Sept 1967); *Auto Torts Not Cause Of Court Congestion*, 8 For The Defense 57 (Oct 1967); *Second DRI Study Shows Court Delay Is Limited Problem*, 9 For The Defense 73 (Dec 1968); Ross, *DRI Studies Refute Court Delay Claims Of Critics*, 36 Ins Counsel J 46 (Jan 1969).

<sup>40</sup>Keeton & O'Connell, note 27 *supra* at 505.

tributed; claims personnel would have to be retrained, etc. Later, if the plan were found unconstitutional, the whole process would have to be reversed. As one insurance executive has noted, the situation would be similar to trying to unscramble an egg.<sup>41</sup> In addition to the logistical problem for the insurance industry, there would be the plight of the person injured in an auto accident between the time the new plan came into effect and a return to the tort system. He would have a valid tort claim against the person who injured him, but there would be no liability policy to cover the claim.

### CONCLUSION

It should be clear that the title, "Complete Personal Protection Automobile Insurance Plan," is a misnomer. The plan is not complete. It is far from being personal.

Claimants under the plan would be treated more like machines than individuals. If a machine is damaged an amount of money can be set to have it repaired; the plan pays hospital and medical bills. If a machine is unproductive while it is being repaired, it is losing money; the plan pays for work loss. If a machine can't be returned to full productivity through repair it is easy to set a percentage on its new output; the plan has a disability benefit

based on an easily calculated percentage. Each of these items lends itself to a neat, fixed, precise bookkeeping entry.

Finally, machines have no feelings; the plan does not consider pain and suffering a fit item for compensation since it varies too much from person to person and there is no precise formula for its computation.

One of the merits of the present system lies in the fact that it treats each person as a person — an individual whose loss is different from that of others and who suffers loss in a different way than others. It is true that the present system has been sharply criticized. It is just as true that many of the criticisms are exaggerated and undocumented. Problems do exist in the operation of the present system but these problems can be resolved within the framework of that system. Leaders of the Bar and insurance industry are devising solutions, some of which are already being applied.

It is claimed that hardly anyone is satisfied with the present auto reparations system and that a change to a no-fault system is demanded. It is often easy to mistake the cries for revolutionary change of a small, well organized minority as a mandate from the majority. However, it should be remembered that the majority is seldom organized and less often vocal. It should also be remembered that all change is not growth and all movement is not necessarily forward.

## Appendix

### ANALYSIS OF THE PLAN'S ELEMENTS

Announced at a news conference called by the American Insurance Association in Washington, D.C., on October 21, 1968, the plan provides:

1. **System Of Compulsory Insurance:** It is recommended that the plan be compulsory. If approved, this coverage would be a prerequisite to registering or operating an automobile in the state enacting the proposals.
  2. **Elimination Of Tort-Fault System:** All insureds covered under the plan would be immune from all tort actions resulting from operation of motor vehicles within an AIA plan state.
  3. **Residual Tort Liability:**
    - (a) Since the immunity from tort liability could not apply if an AIA plan insured causes injury or property damage with his vehicle in a state not having enacted the plan, compulsory, residual liability insurance would also be provided. The liability limits would be those "most commonly in use under state financial responsibility laws."
    - (b) A non-insured motorist (a person from a state not having the AIA plan or, a person from an AIA plan state who somehow evaded the compulsory insurance requirement) who causes injury or property damage in an AIA plan state would remain liable in tort. However, if an AIA plan insured made any recovery against such a person in a tort suit, the insurer would have the right to seek reimbursement from its insured for any amount of benefits it had paid under the plan.
  4. **Who Is The Insured?:** Under the plan, the auto owner and his family are covered as well as occupants of the owner's vehicle and pedestrians who are not otherwise covered.
    - (a) **Multiple Policies:** If an injured person is a passenger or pedestrian he must seek benefits from his own insurer, if he has one (except if he is a passenger in a "public vehicle" in which case the coverage of the vehicle would be primary). If the passenger or pedestrian does not have AIA plan insurance available to him, claim can be made against the insurer of any involved vehicle. In that case, "the usual rules of contribution would apply so as to distribute the loss equitably among the insurers."
  5. **Coverage For Out-Of-State Accidents:** The benefits provided under the plan would be available to the named insured, a relative residing in his household, guest passengers and pedestrians, even if the accident happened in a state not having adopted the AIA proposal.
  6. **Assigned Claims Plan:** The plan would apply to losses suffered or caused by non-residents within the state enacting it. For example, a resident pedestrian not covered by the plan who is injured by a non-resident motorist would be entitled to full AIA plan benefits from the assigned claims program. The same would be true for a non-resident driver and his passengers who are injured in an accident in an AIA plan state. However, note 3.(b) *supra* as to the potential tort liability of the non-resident motorist. The assigned claims plan is also designed to apply in cases in which a person not covered by the AIA plan suffers injury caused by a hit and run motorist.
  7. **Benefits Available:** Under this first party insurance system persons injured in auto accidents would be entitled to the following benefits, without regard to their fault:
    - (a) **Medical And Hospital Expenses:** Expenses for medical attention, drugs, etc., and semi-private hospital accommodations would be paid under the plan without a maximum limit on the amount recoverable.
    - (b) **Work Loss:** Benefits for work loss would be paid and would consist of loss of income from work (e.g. wages) and expenses reasonably incurred for services in lieu of those the injured person would have performed without income (e.g. cost of maid service during time a housewife is disabled). There is a 15% tax deduction from any amount of work loss benefits recoverable. The maximum amount of recovery for work loss is \$750 a month.
    - (c) **Death Benefits:** Benefits would be paid to the survivors of a person who dies as the result of an auto accident and consists of:
      - (1) Loss, after date of death, of contributions of tangible things of economic value (not including services) that statutory beneficiaries would have received from the deceased had he not suffered the injury causing death, and;
      - (2) Expenses reasonably incurred by such statutory beneficiaries after the date of death in obtaining ordinary and necessary services in lieu of those the deceased would have performed for their benefit had he not suffered the injury causing death.
- Economic loss suffered by an insured before death, and unpaid at the time of death would be paid to the beneficiaries in a lump sum.
- (d) **Funeral Expenses:** In case of funeral and burial expenses, reasonable charges not to exceed \$1000 would be paid.
  - (e) **Permanent Impairment Or Disfigurement:** The plan would make no payment for pain and suffering; however, a benefit would be paid for permanent impairment or disfigurement. The size of the benefit would vary, depending on the extent of the injury, but would not exceed 50% of the hospital and medical specials.

- (f) *Property Damage (Non-Auto)*: The owners of property (other than an auto or its contents) would be considered as additional insureds under the plan and, as such, would be paid for damages to their property caused by auto accident.
- (g) *Rehabilitation*: The proposal contemplates payment for the cost of rehabilitation, which could not be unreasonably refused.
- (h) *Periodic Payments*: Payments under the plan would be made on a periodic basis as losses accrue.
8. *No Collateral Source Deduction*: Payments under the plan would be made despite the fact that the claimant has recovered for the same loss from other forms of insurance or benefit programs.
9. *Property Damage (Auto)*: In a state enacting the plan, each owner would be responsible for the damage to his own vehicle. There would be no tort liability for this damage. Collision coverage would be offered to insureds but would not be compulsory.
10. *Disputes Between Insurers And Insureds*: The jury trial and common law practice and procedure would be retained to settle disputes between insurers and their insureds regarding coverages and amounts due. Also, this means of litigation would be open for all cases involving residual liability claims noted in 3. above. The claimant would be responsible for his own attorney's fees in all actions against his insurer unless the court would find that the insurer unreasonably refused to settle the claim or unreasonably delayed payment.

#### COMPARISON OF AIA AND KEETON-O'CONNELL PLANS

The AIA plan is modeled after Keeton-O'Connell's "Basic Protection" plan. The plans are so similar that it is easier to compare their differences than their similarities:

1. *Elimination Of Tort-Fault*: While Keeton-O'Connell would only eliminate tort action if out-of-pocket loss is under \$10,000 and pain and suffering is valued under \$5000, the AIA
2. *Residual Liability Insurance*: The AIA plan makes the purchase of residual liability insurance compulsory so as to cover its insureds who drive in states not having the plan (note p. 21 No. 3(a) *supra*). Keeton and O'Connell make no such provision under their plan. Therefore, under Keeton-O'Connell an insured would have to recognize this potential of liability and purchase this coverage of his own accord.
3. *Limitation Of Benefits*: Neither plan includes payment for pain and suffering under their basic coverages. However, the AIA plan does provide minor benefits for permanent impairment and disfigurement (note p. 21 No. 7(e) *supra*). Both plans limit work loss recovery by a 15% tax deduction and a maximum recovery of \$750 a month. Other than the wage limit, the AIA plan has no limit on maximum recovery while Keeton-O'Connell's benefits are limited to a maximum of \$10,000.
4. *Collateral Sources*: Benefits under the Keeton-O'Connell plan are reduced by any amounts that the injured person receives from collateral benefits. There is no such setoff under AIA's plan.
5. *Property Damage (Non-Auto)*: The AIA plan provides for damage to non-auto property (note p. 22 No. 7(f) *supra*). Keeton-O'Connell has no such provision; therefore, present tort rules apply.
6. *Property Damage (Auto)*: The AIA proposal would make owners responsible for damages to their own vehicles and thereby eliminates tort liability. Collision coverage would be offered but would not be compulsory. Under the original Keeton-O'Connell plan no provisions were made for vehicular damage; therefore, tort rules apply. Subsequent modifications of the Keeton-O'Connell plan provide for forms of collision coverage which would exempt the vehicle owner from tort liability to other vehicle owners if he would purchase collision coverage on his own auto.

# ADDENDUM

## An Analysis And Critique Of

An Automobile Insurance Proposal  
Prepared For Study And Comment By The  
American Insurance Association

Since this Special Report was published in February, 1969, there have been several significant developments regarding the American Insurance Association Plan. These call for expansion of the analysis first given to the plan in *An Analysis And Critique*.

### LEGISLATIVE CHANGES

Initially, the proposal offered no model legislation or sample statutes to implement it. However, legislators in at least two states considered the basic proposals and drafted their own legislation. The differences between the original AIA proposal and this legislation are significant. They demonstrate the extent to which legislators may modify original proposals to conform them to their own personal philosophy.

Connecticut House Bill 6763 was introduced into that state's legislature on January 15, 1969. With two major exceptions, it was modeled closely after the original AIA proposal. While the original proposal set only two limitations on wage loss benefits (a 15% income tax deduction and \$750 a month maximum) this bill added a third providing for a "standard" 10% wage loss deduction. Therefore, an injured person could recover no more than 75% of lost wages up to a maximum of \$750 a month. In addition, although the original proposal disallowed deductions from AIA benefits if the injured person also recovered from a source collateral to his AIA policy, Bill 6763 made another modification — there would be no duplication by the payment of AIA benefits to a person if he had or was entitled to receive similar benefits from any "governmental source." While that term is not defined, it could include such things as workmen's compensation, medicare, medicaid, social security disability benefits, etc.

Connecticut Senate Bill 731 was introduced on the same day as its House counter-

part and had provisions for the same type of limitation on wage loss recovery. It also expanded the collateral source deduction. Under its provisions no AIA benefits would be paid if the insured received or was entitled to duplicate benefits from, for example, accident and health insurance, wage continuation plans and government benefit programs. This, in effect, would make the AIA coverage secondary and all other benefits primary. In this regard, the Bill is quite similar to the collateral source provision of the Keeton-O'Connell plan. Neither of the Connecticut Bills was acted upon by the state's legislature.

In Minnesota, Senate Bill 753 was introduced during the 1969 term of the state's legislature. It was similar to Connecticut Senate Bill 731 in its limitation on wage loss recovery and complete collateral source deductions. But the Minnesota proposal departed from the original AIA plan to even a greater extent. The original proposal called for residual liability insurance to be compulsory so that the insured would be protected if he caused an accident in a state not having the AIA plan. However, the original proposal stated that the limits of the residual coverage would be fixed at the financial responsibility limits of the state in which the motorist was operating his vehicle. The Minnesota Bill set these limits at \$50,000/100,000/10,000. The original AIA proposal called for a benefit to be paid for disfigurement and permanent disability, computed on percentages of up to 50% of the insured's medical expenses. In contrast, the Minnesota Bill provided that the amount paid would be one-half of the maximum benefits for comparable injuries under the Minnesota Workmen's Compensation Act with a maximum limitation of \$25,000. The final significant difference between the original AIA proposal and the Minnesota Bill concerned commercial vehicles. The original AIA proposal held that each vehicle owner should pur-

chase first party coverage to protect himself and his passengers. The Minnesota Bill varied this theme by providing that insurers of vehicles "larger than an ordinary passenger automobile" would be responsible for a percentage of AIA benefits paid to the occupants of other vehicles involved in accidents. The commissioner of insurance for the state was to classify all motor vehicles into categories and would assign each a percentage of responsibility for benefits to occupants of other vehicles. This provision can be explained through an example. If the commissioner classified all pickup trucks as "15% vehicles" and a pickup truck was involved in an accident with a private passenger car, the truck's insurer would be liable for 15% of the AIA benefits paid to the occupants of the passenger car in addition to all the benefits paid to the truck driver and its occupants. The Minnesota legislature took no action on Bill 753.

#### COST ANALYSIS

When the AIA plan was released, claims were made that its enactment would result in substantial savings for those who now purchase automobile liability insurance. The American Mutual Insurance Alliance Actuarial Committee made a six-month study of the statistics which had been used to develop these cost projections. Their conclusion was that the plan would not be as inexpensive as was claimed by its supporters.

Paul S. Wise, AMIA president, said that Alliance figures show an overall three per cent cost reduction in three categories of automobile coverage, compared to a claimed 30 per cent reduction. He also indicated that these statistics would change if a 10 to 15 per cent premium increase were needed to bring rates up to an adequate level. The Alliance conclusions were:

1. An insured person presently carrying "minimum coverage" 10/20/5 liability and uninsured motorist would pay an average of five per cent less under "no fault" minimum coverage rather than the estimate of 45 per cent saving.
2. An insured person presently carrying 10/20/5 liability and uninsured motorist plus collision would pay an average of five per cent more, in contrast to a projected 19 per cent saving.
3. An insured person carrying 25/50/5 liability, 10/20 uninsured motorist,

collision and \$1,000 medical payments would pay an average of nine per cent less rather than a claimed 29 per cent.

4. In addition, Wise reports that losses covered by the "no fault" plan but which were not included in cost calculations would cause still more divergence:
  - a. Income loss due to permanent partial injuries.
  - b. Income loss beyond 99 weeks of disability due to permanent total injuries.
  - c. Survivors' benefits in death cases.
  - d. Out-of-state property damage liability (omitted only from the "minimum coverage" estimates).

The Alliance report also indicates that the number of auto accident victims who would collect under the compulsory accident and disability coverages of "no fault" has been underestimated. It also was critical of the premise that disability payments could be adjusted periodically to keep pace with inflation and to reflect the probable earning power a disabled person would have attained had he not been injured. The difficulty lies in establishing adequate rates to cover future imponderables and how to measure the earning capacity of young persons whose aptitudes and income levels had not been established at the time of the accident. Wise said, "Adoption of this concept of floating benefits would require the establishment of long-term, fluctuating loss reserves and an increase in current insurance rates to make sure these reserves are adequate to cover future benefit increases for persons injured today."

#### AIA SAMPLE STATUTE

As previously noted, a sample statute was not issued with the original AIA proposal. Because of this the precise details of the plan were not known when *An Analysis And Critique* was issued. To date no public announcement of a model legislation or a sample statute has been made. We have received a sample statute which is dated June 17, 1969. It is not possible to know whether this is a "final" or only a "preliminary" draft. However, the differences between it and the original AIA proposal are significant. They indicate changes in thought by originators of the proposal.

#### WAGE LOSS LIMITATIONS

In the original proposal the only limitations upon recovery of wage loss benefits

was the 15% tax deduction and the \$750 per month maximum limit noted earlier. The sample statute modifies this by providing a \$25 per day limit on wage loss benefits for persons who are away from work less than a month.

#### DISABILITY BENEFITS

As previously noted, the original proposal called for a benefit for permanent disability or disfigurement computed on percentages of up to 50% of the injured person's medical expenses. The sample statute has no such provision. Therefore, under the statute there would be no benefit at all for the type of loss presently classified as "pain and suffering." The only compensation would be for wage loss, medical and hospital expenses, and a death benefit.

#### SURVIVORS LOSS

The original proposal provided for a survivors loss benefit if death resulted from an automobile accident. The sample statute clarifies the maximum amount of the benefit. It provides that the deceased's life expectancy will be computed on mortality tables determined by the insurance commissioner. The benefit will not exceed the sum of \$750 multiplied by the number of months of the deceased's life expectancy.

#### COLLATERAL SOURCE SET OFF

Although the original proposal specified that a deduction from AIA benefits would not be made if the insured also received similar benefits from sources collateral to the AIA policy, the sample statute modifies this. It is similar to Connecticut House Bill 6763, in that it specifies that AIA benefits would be reduced by any amount the insured receives or is entitled to receive from any "statutory source." Again, this term is not defined but could include workmen's compensation, medicare, medicaid, social security disability benefits, etc.

#### COMMERCIAL VEHICLE MODIFICATIONS

The original proposal called for each insured to seek AIA benefits from his own insurer, except when he was injured while driving or riding in a public passenger vehicle. In such a case, the insurer of the public passenger vehicle would provide primary coverage for the vehicle's driver and all passengers, even if they were also covered by their own policies. The sample

statute follows this proposal but adds additional provisions as to which insurer will be primary. Vehicles designed or primarily used to transport property or equipment over public highways are singled out. Their insurers would be primarily liable (up to \$1 million) to pay AIA benefits to all persons in other vehicles injured in accidents which involved these commercial vehicles. Thus, for example, if a truck and two private passenger autos were involved in an accident, the truck's insurer would be liable to pay AIA benefits to the occupants of the two automobiles, in addition to whatever liability it might have to the truck's occupants. This liability is absolute and the absence of fault of the commercial driver would not matter. The commercial vehicle's insurer would appear to be liable even if the vehicle were legally parked at the time of the accident. The only exception to this absolute liability would arise if the accident involved a public passenger vehicle and a commercial vehicle. In such a case the insurer of the public passenger vehicle would still be responsible to pay AIA benefits to its driver and passengers.

As noted in *An Analysis And Critique*, the AIA plan would also cover damage to property (other than automobiles and their contents) by making the property owner an additional insured. The sample statute also imposes absolute liability on the insurers of commercial vehicles by making them responsible for any non-auto property damage resulting from an accident. Again, the limit of this liability is \$1 million. Another example would be in order since it would appear that if a truck was properly parked and was struck by a passenger car, the truck's insurer would be liable for any property damage caused if the truck were moved over the curb, striking a building or store front.

#### CONCLUSION

The variations between present AIA proposals and the original AIA plan have been noted. Since a sample statute or model legislation was not issued when the original proposal was introduced, it is only possible to note significant differences between the propositions, then and now. This Addendum notes these differences so as to point to possible changes in thinking and philosophy which may have taken place after the proposal was introduced and was subjected to scrutiny and analysis.

# Automobile Insurance: The Rockefeller-Stewart Plan

JAMES D. GHIARDI\* AND JOHN J. KIRCHER\*\*

## Introduction

The announcement of a "new" automobile insurance proposal developed by New York's insurance commissioner, Richard E. Stewart, and governor, Nelson A. Rockefeller, was typical of other announcements of other "new" plans and proposals which had come before it.<sup>1</sup> A news release was issued.<sup>2</sup> It, as others had before it, began with a recitation of all of the "shortcomings" of the present automobile insurance and accident reparation system — too slow, too costly, too inequitable, too impractical, and not in tune with modern times. The possibility of improving the present system was termed impossible because of basic failings "traceable to its fundamental principles." What is needed, the release claimed as others had before it, is the adoption of the "new" plan which will not only solve all of the problems that exist and make everyone happy (with the possible exception of lawyers), but would do so for half the cost (in this case 44%) of the present system.

The Rockefeller-Stewart proposal (hereafter referred to as the Plan) is not much different than other "new" auto insurance proposals which have been thoroughly analyzed over the course of the past few years.<sup>3</sup> It offers nothing really new. How-

ever, it does shift benefits and adds innovations which make it necessary to examine it carefully so as to clearly establish what it will and will not do.

## No-Fault vs. No-Responsibility

The Plan, developed by the New York Insurance Department staff, is the result of a little less than five months' work.<sup>4</sup> It is amazing that the monumental job of analyzing the present system and developing a new plan could have been accomplished in so short a time. Keeton and O'Connell took nearly two years to do the same work; the American Insurance Association spent nearly sixteen months; and Congress thought the task so difficult and complex that it gave the Department of Transportation two years and an appropriation of \$1.6 million to conduct a similar study. At any rate, what occurred in New York was a speedy condemnation of the present system and the proposal of a "no-fault" automobile accident reparation plan based on the research and cost studies of other groups. Its timing gives it a distinct political flavor.

Actually the Plan and other proposals upon which it is patterned should be referred to as "no-responsibility" rather than "no-fault" plans. Careless and reckless drivers would still speed, pass on hills, cross center lines and otherwise violate the rules of the road. What would be different is that the careless and reckless drivers would not be held responsible for the injuries and damage caused by their conduct. A motorist could run a stop light and collide with another vehicle without being held responsible for the injuries to the people in the other car or damage to the other vehicle. The passengers would have

\*\*Associate Research Director, Defense Research Institute, Milwaukee; member, State Bar of Wisconsin, American Bar Association.

<sup>1</sup>The plan is outlined in a report, *Automobile Insurance . . . For Whose Benefit?* (Feb 12, 1970) [hereafter cited as Stewart Report] which was prepared by the New York Insurance Department staff. Enabling legislation was also drafted and introduced into the New York Senate as Senate Bill 8922 (Mar 16, 1970).

<sup>2</sup>Dated February 16, 1970 and issued by Governor Rockefeller's press secretary.

<sup>3</sup>The Plan contains basic features of both the Keeton-O'Connell and American Insurance Association proposals. See, *Basic Protection — Diminished Justice At High Cost*, 8 *For The Defense* 73 (Dec 1967); Keeton Plan — *Analysis of Major Elements*, 8 *For The Defense* 75 (Dec 1967); The

<sup>4</sup>Stewart Report, note 1 *supra* at iii-iv.

Keeton-O'Connell Plan — *Some Questions And Answers*, 9 *For The Defense* 25 (Apr 1968); DRI Special Report, *An Analysis And Critique of an Automobile Insurance Proposal Prepared for Study and Comment by the American Insurance Association* (Feb 1969) [hereinafter cited as AIA Critique].

to look to the insurer of the car in which they were riding for the limited benefits the Plan provides.

#### *Mini-benefits — Maxi-price*

What the Plan proposes is that the present system be scrapped and that, in its place, each car owner be required to carry insurance that will pay benefits to passengers injured while in his car and pedestrians hit by his car.<sup>5</sup> The benefits are limited to medical and hospital expenses, wage loss and rehabilitation expenses *not compensated from other sources*.<sup>6</sup> "Other sources" include personal accident & health insurance, accumulated sick leave, wage continuation benefits, union health and welfare benefits, workmen's compensation and any other source of benefits — with the exception of those sources which are funded "from general public revenues." Although not defined, it would appear that sources funded "from general public revenues" might include Medicare, Medicaid, Social Security and other public welfare programs. Why persons receiving benefits from public sources will be allowed what amounts to a double recovery and those who receive similar benefits from private sources will not, is unexplained.

A great number of persons injured in New York auto accidents would recover nothing if the Plan were enacted. They would fall within the classification of those "compensated from other sources." According to the insurance commissioner's own report, 91 percent of the workers in New York are covered by health insurance and most are covered by income continuation plans as well.<sup>7</sup> The Plan promises lower premiums for these people. However, for these persons the Plan would be too expensive no matter how cheaply it could be offered. They would be forced, because of the compulsory nature of the plan, to buy insurance from which they could never benefit. The operation of the plan would force a person to look to his sick leave benefits for wage loss reimbursement resulting from an automobile accident. However, such a person would have no source of wage loss reimbursement if the accumulated sick leave were used up as the result

of the auto accident and he later sustained an illness or suffered an injury not connected with an auto accident.

There would be others for whom the Plan would be the equivalent of *Last Resort* or *End-Of-The-Road Insurance*. These would be the persons who would have some of the expenses which result from an auto accident paid by private insurance and benefit plans. Their automobile insurance would only be effective to pay whatever portions of those expenses were not taken care of by the private sources.

The persons who would seem to benefit the most from the Plan would be those who would be covered by Medicare, Medicaid, Social Security, and other public welfare programs. Presumably, many of these persons would not own vehicles and therefore would not be forced to buy the insurance. However, if one of these persons was injured in some form of automobile accident, he would apparently be able to have his expenses paid by the various public welfare programs and also recover benefits from the vehicle's insurer. This would all be without cost to these persons. In addition, the improvident person who uses his income for things other than the purchase of accident & health insurance, wage continuation plans, and the like, would benefit the most under such a plan.

#### *Owning The Right Type Of Property*

The manner in which the Plan handles property damage arising from motor vehicle accidents is similar to that used by other no-responsibility plans.<sup>8</sup> As to damage to motor vehicles, the Plan is truly one of no-responsibility. Each vehicle owner must bear the cost of damage to his own auto.<sup>9</sup> For example, if an auto is properly parked in its owner's driveway when it is struck by a reckless driver, the auto's owner or his insurer would be responsible for the cost of repair. The reckless driver could go merrily on his way without any responsibility for the property damage he caused. Vehicle owners would have to buy collision and comprehensive coverage to ease the burden of shouldering auto repair costs. However, it would have to be bought as a separate coverage and its cost is not included in the alleged "savings" of

<sup>5</sup>Id at 83-4.

<sup>7</sup>Stewart Report, note 1 *supra* at 30.

<sup>8</sup>See, e.g., AIA Critique, note 3 *supra* at 10.

<sup>9</sup>Stewart Report, note 1 *supra* at 89.

the Plan.<sup>10</sup> Collision coverage comes with a deductible so that the motorist would shoulder the first fifty, one hundred dollars or more of the automobile repair costs caused by the negligent or careless driving of another.

While innocent vehicle owners must foot the auto property damage bill for the driving habits of the careless and reckless driver, the Plan is more benevolent to owners of non-vehicular property. If a motorist is driving down the street when one of his tires unexpectedly blows out, for example, and he loses control of his car which jumps a curb and strikes and damages a building, his insurer will pay all of the repair costs of the building owner.<sup>11</sup> The question of whether the driver was actually at *fault* for the damage would not be considered. In this case, the liability of his insurer is absolute. All that is needed is that damage to non-vehicular property occur as the result of the use of a vehicle. The insurer of the vehicle is totally responsible for that damage — deserved or not. Thus, a motorist could strike a parked car and his insurer would be liable for damage to the car's contents but not to the car itself.

Recently released statistics indicate that as much as 55 percent of the automobile insurance premium dollar goes to pay for property damage coverages, including damage to automobiles.<sup>12</sup> In some areas of the country the figure is as large as 70 percent of the premium dollar (in Queens, New York, 69%).<sup>13</sup> The Plan does nothing to prevent automobile accidents and thus the cost of the insurance protection needed for property damage would not be lowered, but rather is increased, with its enactment. The shifting of responsibility for non-vehicular property damage to innocent motorists who are not responsible for it should increase the cost even more. Any increase in accident frequency or the cost of repairing damaged property will cause insurance costs to skyrocket. The proponents of the Plan claim that the cost of motor vehicle *property damage liability insurance* would be reduced with their proposal. This promise is true but illusory. Tort liability for motor vehicle property damage is eliminated, but the cost of re-

pairing motor vehicles is actually shifted to collision coverage which each motorist would have to buy so as to provide protection for his own vehicle from damage. The cost of this insurance would surely increase.

#### *Give Up A Lot To Get A Little*

Not only is the Plan typical of other no-responsibility plans in the type of limited benefits it offers; it is also typical of the other plans in terms of what it would require New York residents to give up for the privilege of having such a plan — even if many of them don't really need or want it.

Innocent traffic victims, injured through the careless and reckless conduct of others, would have to give up the right to seek full compensation for all damages suffered in return for a plan that promises to pay limited benefits *only* if compensation is not received from other sources. Under the Plan an innocent traffic victim would be denied compensation for partial and permanent disability, loss of earning capacity, disfigurement, dismemberment, loss of bodily senses, or the pain, inconvenience and suffering associated with injury.<sup>14</sup> All of this would have been borne with Spartan endurance because damages for these items of loss are not easy to compute and are therefore eliminated. A person might suffer the loss of a hand in an auto accident caused by another's carelessness and receive little or nothing from the Plan because economic loss in such a case is relatively small and payments from "other sources" would reduce any payments to be made under the Plan. Yet, he would receive no compensation for the pain and suffering associated with the terrible trauma and the inconvenience and humiliation involved in being deformed for the rest of his life. Proponents of the Plan, as do proponents of other no-responsibility plans, intimate that there is something wrong or dishonest about claiming damages for non-economic loss associated with personal injuries.<sup>15</sup> However, this type of loss is just as real to the person who suffers it as is the medical bill that would have been covered except for the fact that it was paid by another source. Thus, because of the Plan's curious features, a pedestrian

<sup>10</sup>Id at 109 n 187.

<sup>11</sup>Id at 89.

<sup>12</sup>Journal of American Insurance (Nov-Dec 1969).

<sup>13</sup>Id.

<sup>14</sup>Stewart Report, note 1 supra at 84; Senate Bill 8922, note 1 supra § 675.

<sup>15</sup>Stewart Report, note 1 supra at 29 n 47.

would receive no compensation for his disfigurement or dismemberment but any personal property he was carrying at the time of the accident would be repaired or replaced by the insurer of the motorist who struck him. Many New York residents would give up a great deal more than they could ever get. Many would be forced to buy insurance they don't need, to give up their present rights under the law and, in case of an accident, would get nothing in return.

The Plan would give all New York motorists a license to injure any person or damage any motor vehicle found in their state without any responsibility to the person damaged by their conduct — a benefit of questionable value. While you may use your car to injure and maim all you want to under the Plan, you will still be responsible in tort, to the survivors of those of your victims whom you kill. The insurance commissioner's report does not state the position that a person who uses a car to kill has a greater responsibility than one who uses it only to cripple or dismember. Rather, the different treatment for the two types of drivers was occasioned by the belief that absolving the killer of responsibility would be in violation of the New York constitution.<sup>16</sup> The report states that the abolition of responsibility for causing another's death would have to await a future constitutional amendment.<sup>17</sup>

#### *The Plight Of The Commercial Vehicle*

The commercial vehicle has been singled out for special treatment (or mistreatment). Owners of commercial vehicles will be absolutely liable to reimburse insurers of other vehicles for all the benefits which have been paid as the result of an accident involving a commercial vehicle.<sup>18</sup> The owners of commercial vehicles would also be responsible for property damage to "any other kind of motor vehicle."<sup>19</sup> The definition of "commercial vehicle" used by the Plan is that found in the state's Vehicle And Traffic Law. Section 376 (11) (b) of that Law defines "commercial vehicle" as:

Every type of motor-driven vehicle used for commercial purposes on the highways,

<sup>16</sup>Id at 86 n 139.

<sup>17</sup>Ibid.

<sup>18</sup>Senate Bill 8922, note 1 supra § 671(3).

<sup>19</sup>Id § 671(3)(b).

such as the transportation of goods, wares and merchandise and motor coaches carrying passengers; including trailers and semitrailers, and tractors when used in combination with trailers and semitrailers, and excepting such vehicles as are run only upon rails or tracks.

The Plan, however, specifically excludes the owners of "a motor coach for carrying passengers" from its absolute liability.<sup>20</sup> The reason for the exclusion is that the drafters of the plan believe that "motor coach" owners will have enough of a burden.<sup>21</sup> Under the Plan they will be responsible to pay benefits to all of their injured passengers. In an accident involving a large bus, the exposure of the bus owner or its insurer could be great. Interestingly, the Plan and the Vehicle And Traffic Law are both silent as to the definition of "motor coach," although the latter defines "bus" in Section 104 as:

Every motor vehicle designed for carrying more than ten passengers and used for the transportation of persons; and every motor vehicle, other than a taxicab, designed and used for the transportation of persons for compensation.

It would appear that trucks, taxis, and passenger cars "used for commercial purposes" would be subject to the plan's absolute liability provision. There will unquestionably be a number of lawsuits to judicially determine whether certain vehicles are or are not "used for commercial purposes" or come under the term "motor coach." As with the insurer of any vehicle involved in a collision with non-vehicular property, the liability of the owner of a commercial vehicle is not based upon responsibility for the accident. Rather, a collision between a commercial and non-commercial vehicle is all that is needed for the liability of the owner of the commercial vehicle to be established. After that, the only question to be determined is the number of dollars and cents involved. The utter inequity of this feature of the Plan can be shown by the following illustration:

Two passenger car drivers become involved in a drag race and run an arterial stop sign. Both collide with a taxi that enters the intersection on the arterial. The cab

<sup>20</sup>Note 18 supra.

<sup>21</sup>Stewart Report, note 1 supra at 91 n 150.

driver, his passengers and the drivers of the speeding cars are injured. All three vehicles are total wrecks. The cab owner would have the following responsibility:

1. To reimburse the insurers of the two speeding cars for the Plan's benefits paid to the drivers.
2. To pay the two speeding drivers for the loss of their vehicles.
3. To pay the Plan's benefits to the passengers of the cab if they were not compensated from other sources.
4. To pay the Plan's benefits to the cab driver if he was not compensated by workmen's compensation or some other source.
5. To pay for the loss of the cab.

Unless one of the cab's passengers or its driver died as a result of the accident, those persons would have no right to hold the speeding drivers responsible for the damages they had caused. Why should commercial vehicles in New York be singled out for such outrageous treatment? If the proponents of the Plan believe that a no-responsibility plan is the answer to present automobile accident reparation problems, they are inconsistent in their resort to complete responsibility in the case of commercial vehicles. Perhaps the claimed cost savings for the "average motorist" is accomplished by shifting the cost to the commercial vehicle — like robbing Peter to pay Paul.

#### *Pity The Career Pedestrian*

A person who does not own a motor vehicle and who would be "compensated from other sources" should he be injured in a motor vehicle accident would lose the most as the result of the enactment of the Plan. It provides that the insurer of a motor vehicle involved in an accident with a pedestrian would pay the Plan's benefits to the pedestrian.<sup>22</sup> However, this would be no help to the pedestrian who has his out-of-pocket expenses "compensated from other sources." He would not be entitled to benefits and would not be able to seek damages from the motorist whose reckless or careless conduct caused injury. Motorists are absolved of all responsibility in this type of accident, unless they were so thoughtless as to kill one.

<sup>22</sup>Senate Bill 8922, note 1 supra § 671(1).

The career pedestrian who would be "compensated from other sources" really gets the worst of the bargain. He is not only forced to give up the right to recover damages from the careless motorist, but retains personal responsibility for any damages caused to others by his own careless or reckless conduct as a pedestrian. The Plan only abolishes actions "based on negligence in the use or operation of a motor vehicle."<sup>23</sup> Thus, a pedestrian who suddenly darted into the street and caused a motorist to swerve his car into a tree, for example, would be liable to the motorist for auto damage and personal injuries just as if the Plan had never been enacted. On the other hand, the motorist who runs down a pedestrian with "other sources" of compensation would have no responsibility as long as the pedestrian was not killed.

#### *The Drunk And The Drugged*

Many of the no-responsibility plans which came before the Rockefeller-Stewart proposal have been criticized because they would allow the drunken driver, the escaping criminal, or the driver who is operating under the influence of a narcotic drug to recover benefits on the same basis as the innocent traffic victim who is injured by such use of a motor vehicle. It is clear that the proponents of the Plan sought to meet and avoid this type of criticism. The approach they use is novel, but does not strike at the heart of the issue.

The Plan provides that the drunken or drugged driver, the person operating a vehicle while committing a felony, and the person operating a vehicle with the specific intent of causing injury or damage will be absolutely liable, without regard to fault, to reimburse insurers of other vehicles for benefits paid and for property damage to other vehicles.<sup>24</sup>

Persons belonging to these four classes become, for the purpose of the plan, absolutely liable in the same manner that owners of commercial vehicles are absolutely liable. It is not necessary that the drunk or drugged condition be shown as the cause of the accident. All that is needed is an accident between a car operated by a person in one of the four classes and another car or person.

or could be struck from the road while

<sup>23</sup>Id. § 675.

<sup>24</sup>Id. § 671(4).

stopped at a stop light and he would be held responsible to repair the car of the person who struck him and pay the insurer of the other car for any benefits it paid the careless driver. Everyone would admit that those four types of drivers are a menace and should be kept off our roads, but the Plan ignores highway safety and only seeks to redistribute losses caused by these unsafe drivers. In fact, because of the compulsory nature of the Plan, these individuals are assured of insurance.

Even with this provision designed against drunken and drugged drivers, etc., the Plan still provides them with the same type of beneficial treatment that has subjected other plans to criticism. Even though a drunken driver may be liable to reimburse another insurer for benefits paid to persons he injured by his drunken operation of a motor vehicle, he is still allowed to recover benefits from his own insurer. He may not even be liable to another insurer since the person he injured may be one who has received benefits from another source and therefore would not be entitled to benefits. The proponents of the Plan recognized the problem of the drunk and the drugged driver but they did not adequately deal with the issue.

#### *The Problem Of Gaps And Cost*

The proponents of the Plan claim that if their proposal were enacted and motorists bought their basic coverages rather than present coverages, significant savings would result from present auto insurance premium costs. The Plan calls for three basic compulsory coverages:

1. The first party, no-responsibility coverage.
2. \$10,000/20,000/5,000 liability coverage for out-of-state BI and PD claims and for in-state wrongful death claims.
3. Non-vehicular property damage coverage.<sup>25</sup>

It would be clear to the prudent motorist that the Plan would leave certain coverage gaps which he would want to fill. These would include:

1. Coverage for situations in which strict liability is imposed because of drunken or drugged driving or while committing a felony or driving with an intent to cause injury.

2. Collision coverage for property damage to owned vehicles.
3. Comprehensive coverage to provide for theft, vandalism, fire and windstorm damage.
4. Coverage for situations in which absolute liability is imposed upon commercial vehicles.
5. Additional liability insurance protection over the plan's basic rates of \$10,000/20,000/5,000 for out-of-state BI and PD and for in-state wrongful death.
6. Uninsured Motorist Coverage. (The proponents of the Plan stated that the role of the New York Motor Vehicle Accident Indemnification Corporation (MVAIC) would be changed if the Plan is adopted. How MVAIC will be involved in uninsured motorist situations is not clearly spelled out. However, at the least, some form of U.M. coverage would be taken out by a prudent motorist for driving out of New York state.)<sup>26</sup>

The purchase of any of these additional coverages would, of course, reduce any saving that could be achieved if the plan was enacted. Any additional coverages, such as the proposal for optional first party insurance to offset elimination of pain and suffering recoveries, would have a similar effect.<sup>27</sup> The number of additional coverages purchased would have a direct relation to the financial status of the insured.

Will the Plan be made available for 56 percent less than is presently paid for auto insurance in New York? The cost saving estimates of the proponents of the Plan speak of savings of "as much as" 56 percent and therefore, even if the Plan lives up to their optimistic expectations, all insurance buyers will not gain such savings.<sup>28</sup> The first reaction that one has to the cost prediction of the proponents is that it would be very inequitable for a plan with benefits as limited as those to charge any more than the estimates. In some cases, insurers that charge rates even on the 56 percent reduction figure might be criticized. Clearly, the Plan would be grossly expensive for those who will be unable to receive its benefits because they are "compensated from another source." For those who will be unable to recover for the disability, disfigurement, dismemberment,

<sup>25</sup>Id at 85 n 137.

<sup>27</sup>Id at 95.

<sup>28</sup>Note 2 supra.

<sup>26</sup>Stewart Report, note 1 supra at 109 n 187.

pain, suffering and inconvenience caused by the negligent or careless driving of others the Plan will also be too expensive.

Whether the Plan will actually achieve the reduced cost structure predicted of it is open to debate. The actuarial data used by the New York Insurance Department for its cost analysis was taken primarily from the study conducted by the American Insurance Association to cost its own proposal. The validity of this study by AIA has been seriously challenged.<sup>29</sup> Independent actuaries retained by a New York Senate committee have studied the cost analysis of the New York Insurance Department and have concluded that the actual cost of the Plan would be significantly higher than that which was predicted.<sup>30</sup> The fact that there is a disagreement as to the actual cost of the Plan should, of itself, be a sufficient reason to move cautiously. Further, any savings which could possibly be achieved would result only from a reduction in benefits.

Who will pay the most for the insurance coverage offered by the Plan? It seems certain that, as with other proposals of a similar nature, premiums charged would not depend upon whether the insured has a good or poor driving record — whether an insurer is forced to pay the Plan's benefits is not dependent on the fault of its insured. With protection from "other sources" being equal, the safe driver may end up paying more for the Plan's coverage than a highway menace simply because he and his passengers may be entitled to recover more benefits under the plan than the person who caused the accident in which they were injured. "Bad risks" under the plan would be insureds with large families, cars capable of holding many passengers, working wives, above average incomes, and other characteristics indicating a large benefit pay-out in case of an accident — even if it was caused by another motorist. "Good risks" would be those who are unemployed or have small incomes, have small or inexpensive cars, and have other characteristics which in-

dicade a small pay-out of benefits in case of an accident — even if they cause the accident by their careless driving. The whole process of merit rating and good driver discounts would be turned around under a program such as the one offered by the Plan.

It has been recognized that the Plan seeks to lower insurance costs by making its coverages secondary to the "other sources" which were discussed previously. This method of cost reduction will only last as long as the "other sources" or those who offer them are content to allow the Plan to have this free ride. If those who offer the "other sources" would revise their programs or contracts to provide that they would pay no benefits in automobile accident cases or would pay them only after benefits from applicable auto insurance had been exhausted, the Plan would become the primary source of benefits and the cost savings achieved by the "other sources" setoff would disappear.

#### *Legal Problems*

All of the various no-responsibility proposals presented to date claim, as one of their aims, to end "the automobile accident litigation that is crowding our courts."<sup>31</sup> Claims that most jurisdictions are troubled with court congestion and that the average automobile accident claimant must wait a long time for compensation have been more than adequately shown to be without merit and need not be discussed further.<sup>32</sup> There is court delay in some areas of New York, but to be considered is whether the Plan itself will have an impact on litigation.

First, it should be clear that all litigation arising from automobile accidents will not be eliminated by the stroke of the pen which would sign the plan into law. By its own terms, the plan would do nothing to affect wrongful death actions which result from motor vehicle accidents. New York has common borders with Canada and five other states. Many of New York's large population centers abut these borders. New Yorkers would remain liable in tort for any injuries or damages caused by their operation of motor vehicle outside of their

<sup>29</sup>See, e.g., Report of the American Mutual Insurance Alliance Committee on the Adequacy of the Costing of the American Insurance Association's "Complete Personal Protection Automobile Insurance Plan" (May 2, 1969).

home state. In addition, the reasoning followed by many state courts in cases involving conflict of laws questions would lead one to believe that a person from New Jersey, for example, could find a court in his home state willing to hear a negligence action resulting from an accident in New York involving a New York driver. In fact, the rulings of New York courts on conflict of laws issues would indicate that a New Yorker injured in an auto accident in another state would be allowed to use the New York courts for his action against the responsible motorist. Since the Plan would only eliminate negligence actions based upon the use or operation of a motor vehicle "in this state,"<sup>33</sup> two New Yorkers could collide in New Jersey or Connecticut and use the New York courts to resolve their dispute.

Also, the plan would only do away with personal injury and property damage claims "based on negligence in the use or operation of a motor vehicle."<sup>34</sup> Therefore, it would not prevent a person injured in an automobile accident from making a claim against the manufacturer of one of the vehicles involved on the theory that defective design or construction caused the accident. Claims against automobile garages and service stations alleging faulty repair or maintenance would still be possible. Suits such as these are becoming more prevalent, even without no-responsibility plans, and one can surely forecast more interest in this type of litigation should normal automobile liability claims be eliminated.

Suits against other classes of persons, not engaged in the "use or operation of a motor vehicle," would still be possible. The plight of the career pedestrian who is found responsible for the damage and injury caused in a motor vehicle accident has been discussed. Those who operate bicycles or ride horses would "enjoy" a similar status with the pedestrian. The persons who sell intoxicants to motor vehicle operators would, under a Dram Shop Law,<sup>35</sup> remain liable to persons injured by intoxicated drivers. Suits which allege that an auto accident occurred because of an alleged defect in a road, improper road design or signing would also be possible. In addition, since the Plan only eliminates

negligence actions, there would be no way to prevent suit against a motor operator on the ground that he acted recklessly or wantonly caused injury or damage. The question arises as to whether actions involved in a design defect designated as "grossly negligent" would be held as being "based on negligence" within the meaning of the provisions.

Since certain classes of persons are mainly liable to motor vehicle accidents, a question arises which rights which an individual in one class would have against a motorist. For example, if a passenger injured in an automobile accident brings suit against the automobile manufacturer claiming defective design, the manufacturer would assert that the accident was actually the fault of the passenger. Can the manufacturer ask, that at the accident be found to be caused by its fault and that of the driver, that the allowed contribution from the driver's portion of the passenger's damage contribution claim is eliminated? Can the manufacturer be liable for all the or only a portion attributable to negligence? These types of problems will keep New York courts and lawyers busy for some time.

Will the provisions of the Plan result in disputes between claimants and insurers? One does not have to be a expert in insurance law, but only examine some of the Plan's provisions to see the types of questions which will call for judicial interpretation:

1. Were the medical and hospital expenses of the claimant "reasonable"?
2. Were the medical and hospital payments received by the claimant "satisfactory"?
3. Were the expenses for medical and hospital treatment actually "incurred" by the claimant?

(Questions 1, 2 and 3 can be repeated as far as physical and occupational rehabilitation are concerned)

4. Would the money sought by the claimant for loss of income have "not been earned but for the injury"?
5. What amounts would have "been paid but for the injury" by a prudent

<sup>33</sup>Senate Bill 8922, note 1 supra § 675.

<sup>34</sup>Ibid.

<sup>36</sup>Senate Bill 8922, note 1 supra § 671.

is totally and permanently disabled by an auto accident and unable to complete school or pursue the occupation for which he was being trained?

6. Is the loss of income from an investment which would have been made except for an automobile accident injury an amount which would have "been earned but for such injury"?
7. Just what are "all other expenses reasonably and necessarily incurred on account of such injury"?
8. Is the claimant entitled to benefits at all because his expenses were reimbursed "from other insurance or similar sources"?

These few questions bring to mind the words of a famous jurist:

The intrinsic difficulties of language and the emergence, after enactment, of situations not anticipated by even the most gifted legislative imagination reveal the doubts and ambiguities in statutes that so often compel judicial construction.<sup>37</sup>

It would appear that the Plan may even produce business for attorneys who specialize in tax law. The plan provides for payment of lost income less "taxes which would have been payable on such lost earnings."<sup>38</sup> A person receiving a reimbursement for lost earnings "less taxes" would assume that the net amount received is not subject to tax. However, there is no gross income benefit from which the insurer subtracts taxes. Rather, it only pays a net sum on the theory that the sum paid is not subject to taxes. No funds are transferred by the insurer to the government. The Internal Revenue Code stipulates that "the amount of any damages received (whether by suit or agreement) on account of personal injuries" need not be included in gross income.<sup>39</sup> The Internal Revenue Service may not be inclined to agree that a direct, first party reimbursement of lost income falls within that definition.

#### *Will The Plan Solve The Problems?*

One must ask if the adoption of the Plan would solve New York's auto insurance problems.

One major problem is the cost of automobile insurance. There are two basic reasons why the cost of automobile insurance has increased: 1) more accidents and 2) inflation. Rather than proposing legislation which will get the drunks, drug addicts and habitual traffic law violators who cause accidents off the road, the Plan reduces the amount of damages their victims can recover. It treats the effects and not the cause.

One of the major items of expense in the automobile insurance premium bill is the cost of repairing physical damage to motor vehicles. Rather than pressing for automobiles that are more easy to repair, the Plan proposes that each vehicle owner be responsible for his own property damage. It treats the effects and not the cause.

There is a constant increase in litigation in all areas of the law which has resulted in crowding of court calendars in certain metropolitan New York jurisdictions. Rather than creating new judgeships to keep pace with population growth, the Plan would close the courthouse doors to certain litigants and bring forward a proposal so complex that more new litigation may arise than the plan would eliminate.

The Plan does not appear to answer the problems that beset the present automobile accident reparation system. It offers a system of no-responsibility motor vehicle insurance in the face of empirical research which shows that such a system would lead to an increase in motor vehicle accidents.<sup>40</sup> It offers too little and asks for too much to be given up in return. Other proposals which call for improvement of the present system appear more realistic.<sup>41</sup> They seek to solve the problems which exist without denying basic legal rights.

The Plan, presented as a socially oriented proposal to aid the insurance consumer, is, at the same time, discriminatory against the poor, blue and white collar workers, the young and that large group of citizens who would be unable to fill all of the gaps left open by its provisions. It forces a person to use up all of the fringe benefits he and his union have worked so hard to

earn so that the motorist who injures him can be free of responsibility. It leaves the auto accident victim disabled, in pain, and faced with a lifetime to consider the personal sacrifice he was forced to make to help lower the cost of insurance premiums for negligent and careless drivers. It seeks to lower the cost of insurance by denying

most people insurance benefits or by conditioning the payment of benefits upon a series of events which will rarely occur. This can only be considered as a meaningful solution to all the problems of automobile accident reparation if mercy killing is considered a meaningful solution to all injury, sickness and disease.

FOREWORD

Radical proposals have been made to recompense all persons injured in highway accidents regardless of fault. This attempt to meet a social problem would, if accomplished, weaken or destroy the legal system that has been erected so that citizens may gain justice through the orderly process of tort law.

In arriving at their conclusions, proponents of "no-fault" compensation have assumed that this major legal change could be made with no noticeable affect on the highway accident level because the liability insurance system has already removed the need for individual responsibility on the highways. This claim is made without supporting evidence. Such a rash assumption is not a reliable basis for change; nor can the lives of drivers and passengers be gambled in such a manner. It should also be noted that this revolutionary proposal flies in the face of common sense, public and legal values. The fault concept--that one who causes injury to another should fairly and adequately compensate him for that injury--has been and still is very much a part of public consciousness which finds its counterpart in the law of the land.

What is needed is calm analysis aimed at strengthening the values of the present system rather than their destruction. This analysis should be rooted in scholarship and marked by deliberate

application of knowledge to a great and growing problem--highway accidents which in 1968 alone claimed the lives of 55,000 persons.

Such research, enriched by personal experience of a specialist, has been completed and it provides definitive answers to fill the void left by mere common sense arguments. This work, "Psychological Aspects of the Fault System as Compared with the No-Fault System of Automobile Insurance," has been completed by Lawrence Lawton, professional engineer and traffic engineering consultant from Westchester, New York, under a grant arranged by the Defense Research Institute, Milwaukee, Wisconsin. This study is available from the Defense Research Institute. This summary, "Fault--A Deterrent To Highway Accidents," has been adapted from the original work of Mr. Lawton. Mr. Lawton holds a B.S.C.E. degree from the School of Engineering, College of the City of New York, has engaged in advanced studies in traffic engineering at Brooklyn Polytechnic Institute and has completed a Yale University seminar in application of computers to traffic engineering. A specialist in traffic safety and accident reconstruction, a traffic consultant since 1963 and author of numerous scholarly articles, Mr. Lawton has reviewed many hundreds of serious accidents, analyzed accident causes and determined measures to reduce or eliminate such accidents.

Gratitude is expressed by the Defense Research Institute to the following organizations of defense attorneys which aided in financing Mr. Lawton's research: Association of Insurance Attor-

neys, Federation of Insurance Counsel, Alabama Defense Lawyers Association, Association of Defense Counsel (Northern California), Association of Southern California Defense Counsel, Dade County Defense Bar Association (Miami, Florida), Mississippi Defense Lawyers Association, New Jersey Defense Association, Defense Association of New York (New York City), Defense Research Institute of Northeastern New York, Ohio Defense Association, Oklahoma Association of Defense Counsel, Tennessee Defense Lawyers Association, Texas Association of Defense Counsel, and Washington Association of Defense Counsel (Seattle).

In addition to spotlighting causes of many of today's highway accidents and suggesting their remedies in his complete study, Mr. Lawton has concluded that abandonment of the fault principle would increase highway accidents and thereby the number of deaths and injuries and costs to the American public. The Defense Research Institute has premised its opposition to radical change on the theory that fault is basic to the maintenance of a viable legal system of tort law and that removal of the fault concept in favor of a reparations system which would reward innocent and guilty equally would result in increased highway accidents with its resulting harm and death. The Lawton research supports this premise and buttresses the position that responsible reform of the existing system is the answer to the current concern over the increased cost of automobile accidents.

December, 1969

## INTRODUCTION

If man truly observed the first so-called "law" of nature, self-preservation, and he were a totally rational rather than rationalizing animal, the need to study the fault principle and its deterrent effect upon highway accidents would be minimized. Man would do all possible to avoid trouble. Instead, there are many accidents involving factory workers, tailgating drivers, cigarette smokers, individuals who refuse to wear safety belts in their automobiles--to name just a few. Still, there are those who claim that the law of self-preservation is the main determinant of highway safety.

Law, both civil and criminal, is required to constrain man, particularly when his actions can involve others; this statement applies with equal force to laws of the highway and legal and extra-legal actions which follow breaking of those laws. However, it is not enough in this age of criticism to merely advance common sense arguments in support of retention of the fault concept. The value must be proved, if possible.

If our proved system of liability based upon fault is abandoned in favor of a plan that would reward guilty and innocent alike in highway accidents, the results of the new approach must be evaluated before it is enacted and not be left to predetermined whim and fancy. In the following study, the tech-

niques of systems analysis have been utilized to scientifically evaluate impact of the fault system and to predict the results if it were abandoned. It is confirmed that the present fault system maximizes deterrence of highway accidents and that deterrence in a complete no-fault system would be virtually nonexistent. In the study, a systems model based upon studies of individual behavior as related to the group has been formulated. The parameters, or factors, of the model are based upon empirical experimentation. These factors and their application demonstrate the important conclusions which can be drawn.

#### SYSTEMS ANALYSIS APPLIED

Systems analysis is an organized method of predicting the effects of change before a new system is initiated. The need is greatest in those areas which embody complex factors. At the heart of the process is the construction and use of a "model." In most instances the model is a simplified representation of the operation. For complex systems it is common to perform the analysis by using mathematical models. A model, in this sense, is a systematic description of the characteristics of a system. The utility of a model is determined by its accuracy as a tool for the prediction of change, not by the intricacy of its description.

The first step in formulating a model is to analyze the past behavior of the process. The basic behavioral character-

istics must be determined before any meaningful change can be made. A model may be constructed by using known experimental data. Its validity can be verified further by observing behavior of the system parameters, or factors.<sup>1</sup>

Certainly in determining whether a no-fault system should be adopted there is an urgent need for study and model formulation. It is not sufficient to say that future research may determine the relationship between accident frequency and deterrence. Before any change is made, particularly when such great risks are involved, the parametrics of the system must be identified. It cannot be rashly assumed that the adoption of a new legal system will have no effect on the safety of drivers, passengers and pedestrians.<sup>2</sup>

#### INDIVIDUAL BEHAVIOR AND GROUP EXPECTATIONS

This section reviews studies made of individual behavior as it relates to group behavior. Based upon those empirical observations, parameters of a model are formulated to test the deterrent effect of the present automobile reparations system. Factors (parameters) of controlled tests are arranged in a mathematical formula which clearly demonstrates that when one factor is varied the deterrent effect of the system to be measured will either be increased or decreased. Thus, the impact on highway accidents of the fault concept versus no-fault proposals can be clearly forecast.

Carefully fashioned studies have demonstrated that individual behavior is influenced by other human beings, the group. The term "group" is used generically to refer to people other than the individual being influenced.<sup>3</sup>

During early life a child begins to learn actively through the repetitive process called conditioning. Conditioning takes place through trial and error and by acquiring habits taught by parents. These habits are established by reward and punishment. The child makes an important discovery, his need to be loved. This need, based at first on self-love, becomes the foundation for later motives and cultural imperatives. The need for love and protection becomes in the adult, not only the basis of love between two persons, but the need for the approval of society. The man who wants to improve his social position, to obtain power, to possess a bigger and more expensive car, is acting in a way which is based on a child's need for love and his desire to be worthy of approval. True, the mother's approval is the child's group approval, but the fundamental motive is the same.<sup>4</sup>

The fact that individual behavior is affected by group expectations has been verified by many studies. Sherif, in his work at Columbia University, was one of the early pioneers in documenting the influences on the individual behavior. His carefully controlled tests involved 19 subjects in individual experiments and 40 subjects in group experiments.<sup>5</sup> The experiment was

set up to take advantage of the autokinetic effect. In a dark room, a small light would appear to move - even though it was stationary. The subject was asked to state the distance moved. Two different procedures were used. In the first series, the subject was brought into the group after first being experimented upon alone. In the second series, the subject was merely included in the group, without having prior individual experience. The subject was later experimented upon individually. It was found that each of the groups established its own range and norm (standard) at the first meeting. In subsequent sessions, the norms of individuals changed toward the common norm. Sherif proved conclusively that the individual's report of light movement was decidedly affected by the group norm. He pointed out that there was no "right" judgment and that participants felt uneasy until they were given outside judgment for guidance.

#### BASIS OF MODEL PARAMETERS

The results of Sherif's experimentation form Parameter A of the model.

PARAMETER A -- There is no "right" or "wrong" judgment.

Group judgment tends to conform to the norm established by the group.

Sherif found a quantitative as well as a qualitative effect. The reporting of the judgments of the other members of the group had cumulative effect. In other words, the effect on the sub-

ject's behavior was increased with each exposure to the group judgment. These results make it possible to formulate the second (B) and third (C) parameters of our model.

PARAMETER B -- An individual's behavior is influenced by group pressure.<sup>6</sup>

PARAMETER C -- The intensity of the influence on individual behavior is a direct function of the number of contacts between the individual and the group.

It was also determined that when a former group member later faced the same situation as an individual, he perceived the situation in terms of the norm that he carried over from the group. From this finding, the fourth parameter (D) can be stated.<sup>7</sup>

PARAMETER D -- The norm perceived by one's contacts with the group affects later individual behavior.

Another experimenter, Asch, has conducted a study involving 87 subjects, in which the yielding to group pressure was determined.<sup>8</sup> Each subject was required, in the presence of seven others, to match the length of a line with one of three unequal lines. The seven others were experimental confederates who had been instructed to make the same wrong response at various times. This presented the actual subject with a conflict between his senses and the responses of the group. Some three quarters of all the actual subjects showed errors in judgment in the direction of the estimates of the others. Asch found that the effect on the individual's behavior was much greater when the indivi-

dual was singled out. When standing alone, he yielded to group pressure in 32 percent of the total number of experiments. When a second member joined the actual subject in his disagreement with the majority, the individual yielded only eight percent of the time.<sup>9</sup> From these experiments, another factor in individual behavior can be derived, the fifth parameter (E).

PARAMETER E -- The intensity of the influence on individual behavior is increased when the individual is singled out by the group.

In a later experiment, Deutsch and Gerard also demonstrated that an individual's behavior is affected by his expectations of group beliefs.<sup>10</sup> The methodology was similar to that used by Asch. The same type of cards were employed. The initial set of experiments involved a face-to-face procedure in which the actual subject was in the same room with three confederates of the experimenter. In the second set, the subject and each of the three confederates were separated by partitions which prevented them from talking to each other or seeing each other. Panel lights were used so that the actual subject could see the determinations of the others. In one variation, the actual subject was aware that his judgments were known to the others. In the second, he was led to believe that the other subjects had no way of knowing his decisions.

These studies, like the Asch studies, proved that the group's influence on an individual's behavior is reduced when he is not singled out. This is a confirmation of Parameter E. (The in-

tensity of the influence on individual behavior is increased when the individual is singled out by the group). The studies also revealed that the group's effect on the individual was much greater in face-to-face contact.<sup>11</sup> We thus can derive a sixth factor which governs individual behavior, Parameter F.

PARAMETER F -- The intensity of group influence on individual behavior is a direct function of the degree of personal contact between the group and the individual.<sup>12</sup>

The final, and seventh, parameter of our model is provided by experiments conducted by Milgram on 160 male adults.<sup>13</sup> The focus of the study was the amount of electric shock the subject was willing to administer to a victim who was a confederate of the experimenter when an order was given. The subject was led to believe that it was an experiment which involved the effect of punishment on learning. It was found that whenever the victim was brought into the same room with the subject, the number of subjects obedient to the instructions of the experimenter, who remained in the other room, decreased. The conflict becomes more intense for the subject if the experimenter looks at the subject expecting him to continue, while the victim indicates his desire to quit. This result, in regard to an aggressive act upon an individual, may be considered to be an inverse corollary of Parameter F. The corollary may be stated as follows:

PARAMETER G -- The intensity of an aggressive action toward another person is an inverse function of the degree of personal contact between the aggressor and his victim.

#### DETERRENT EFFECT OF FAULT SYSTEM

Thus, parameters have been established as relevant to the relationship between the expectations of the group and individual behavior. These parameters were derived from the actions of subjects in experiments in which ordinates of human behavior were isolated. The independent effect of each factor was determined. The careful control of these experiments offers considerable confidence in the parameters. This confidence has been enhanced by the cross-checking of other investigators. These parameters allow comparison of the relative deterrent effects of the existing fault system and the proposed no-fault system. Before this evaluation is made, an examination must be made of elements of the current fault system to see if there is additional confirmation of the parameters.

Public opinion surveys have shown that the group believes that driver fault is a primary cause of automobile accidents. For example, the Harris Survey of December, 1966, determined the relative importance of individual fault and vehicle defects. The survey reported that by the overwhelming proportion of 96 percent, "the public is convinced that driver carelessness is

a far more important cause of highway accidents than manufacturer's defects."

Similarly, in 1968, the Minneapolis Tribune conducted a survey dealing with a proposed no-fault system of automobile insurance. One question was:

In highway accidents, do you think there is usually one person who is mainly to blame for the accident or are there many accidents in which no one person is more to blame than anyone else?

Sixty-nine percent said that one driver is usually more at fault, while 26 percent indicated a feeling that there are many times when no one party is particularly to blame. Five percent did not reveal an opinion.<sup>15</sup>

#### Generic Model Description And Its Confirmation

As has been explained, the purpose of a system model is to evaluate the effects of a proposed new system. Up to this point, seven detailed parameters have been described. For the present, an abbreviated model description is useful:

Accident deterrence is a direct function of the degree to which the community abhorrence of the causing of an accident is focused on the individual negligent driver.

This brief description of the model may be viewed as a generic parameter encompassing the structures of five of the detailed parameters (i.e., B, C, D, E and F).

In a carefully structured study, which confirms this generic model, Kaestner and Syring worked with driver improvement analysts to devise a motivationally oriented interview built around the individual driver's prior record.<sup>16</sup> It involved drivers with mild infractions, not those with serious or repeated charges. Drivers were randomly assigned to either an interview or control group of 660 persons each. Significantly more of those who were singled out for interview drove one year without a traffic entry. They also went longer before subsequent violations were observed. In the control group, 66 accidents were subsequently recorded, while there were only 50 accidents among the drivers who were interviewed.

Another significant experiment involved 30 violators divided into three equal groups.<sup>17</sup> One group received a simple warning. Another group attended a safety school. The third group participated in experimental sessions run by the experimenter who allowed the discussion to go wherever the members wanted, interrupted only when he heard a "rationalization." The six sessions, which had no time limit, lasted from half an hour to over three hours. In the following year, this third group had only half as many violations as each of the other two groups. Furthermore, among 23 reported accidents in the subsequent five years, only one involved a member of this third group. Needless to say, these results again confirm the validity of

the generic model--focus upon the individual brings results.

A third experiment again illustrates the importance of pointing the finger at negligent drivers.<sup>18</sup> Military authorities were troubled by the large number of automobile accidents involving servicemen in the vicinity of their stations. A study revealed that excessive drinking was a contributing factor in approximately two-thirds of these accidents. After rejecting various countermeasures, such as advance screening and counseling of drivers, a two-fold program was designed: A driver involved in an accident was called in to review his service record and for psychiatric examination. An accompanying educational effort portrayed driving after drinking as disturbed behavior. Accidents declined over 50 percent in the next year. Before concluding that the prevention program had been successful, Professors Barmack and Payne examined and rejected plausible rival hypotheses such as other influences operating in the same direction or a general decline in servicemen's accidents. During the period in question, accidents continued to rise in the general community and at other military bases.

#### Application To Insurance System

We have already demonstrated that there is a group norm in existence which holds that driver fault is the primary cause of automobile accidents. It is of interest to examine the work-

ings of the existing insurance system to see how this norm has permeated the mores of the community. It is of particular importance to examine the various mechanisms by which the finger of causative responsibility is pointed at the negligent driver.

Take the case of a collision accident in which there is no injury; ten out of every eleven accidents are in this category. It is at this significant stage, before he has done any serious harm, that the community abhorrence of the causing of an accident is concentrated on the individual negligent driver.

1. The drivers must of course exchange information as to operator's license and vehicle ownership. There is usually a discussion as to who caused the accident. Sometimes heated and bitter words are exchanged. Usually, neither driver will admit causative responsibility. Almost invariably the errant driver will maintain that, "It was the other fellow's fault." This falsehood must be asserted in the face of the true circumstances of which both drivers are usually well aware. This must be a considerable mental strain for the great majority of drivers who are not hardened and coldly calculating liars.

2. If a policeman shows up, there is another series of conversations. The negligent driver may again continue in his falsehood - this time to an officer of the law.

3. Each driver must then fill out his motor vehicle report, describing briefly the events leading to the accident.

Few people are willing to admit a violation of the rules of the road which caused an accident. The guilty driver, therefore, must fabricate when he describes his version in the first written report of the accident.

4. The negligent driver must continue this falsehood in greater detail, in a face-to-face encounter, when he gives his statement to his insurance company representative. Even with collision insurance, as Keeton and O'Connell point out, the collision insurer is concerned with fault. After paying damage to the insured vehicle (less any applicable deductible), the insurance company will, if the circumstances warrant, submit a claim against the other driver's insurance company.

5. A bad driving record will trigger a series of painful reminders to the negligent driver. Keeton and O'Connell point out that it becomes more difficult and expensive for a driver with a bad record to get liability insurance. Each time the negligent driver pays his increased insurance premium, he is reminded anew of his transgressions.

6. In a case of an injury or death, there is an intensive inquiry of the driver by the insurance company investigators. It is true that a small percentage of claims - between one percent and three percent - are tried to final judgment. However, it is quite clear that concern with fault affects the amount of compensation in those cases that are settled.

7. In the majority of cases with a serious injury, an examination before trial is held. The falsehood must now be carefully compounded. Here the errant driver is placed under the probing examination of a skilled attorney.

The lying witness is under a very real fear of humiliation. He cannot, in a display of disdain, refuse to answer the questions put to him. The answers, if they are based on falsehood, may well lead to mortification and dismay. There is great effort needed to avoid entrapment, and to sense the direction of questioning which may expose him. The mental exertion required, and the potential embarrassment of being trapped in a lie in the presence of others, can add up to an experience close to mental torture. The witness dreads it beforehand, usually suffers while undergoing it, and remembers it afterward with much distaste.

The seven steps which have been outlined above are the means by which the community's abhorrence of the causing of an accident is focused upon the negligent driver. These means are inherent operating mechanisms which come into being because of the workings of the current legal system with its continued emphasis on finding fault.

#### DETERRENT EFFECT OF NO-FAULT SYSTEM

The first highly publicized no-fault plan was proposed by

Keeton and O'Connell.<sup>19</sup> Under this limited plan, the present system would be retained in cases where claimed damages for pain and suffering exceeded \$5,000, or where claimed economic losses exceeded \$10,000. For accident claims which do not reach these limits, there would be a maximum payment of \$10,000. Payment would be made within this limit, without regard to fault, for all out-of-pocket losses. Such payment would be reduced by the amounts received from other forms of insurance carried by the particular individual. No payment would be made for pain and suffering.

A complete no-fault plan has been announced by the American Insurance Association whose members write 38 percent of all private automobile insurance. This plan would provide unlimited coverage, without regard to fault, for medical, hospital, and reasonable expenses incurred. Supposedly, there would be savings in eliminating the legal expense of finding fault. Expenses would also be cut by a reduction in the compensation now paid to non-negligent victims by eliminating any payment for pain and suffering or for economic losses exceeding \$750 a month, and an offset for amounts received from other forms of insurance and sick pay. The supposed savings are to be used in two ways. First, all injured parties are to be compensated (within the reduced limits noted above) irrespective of whether they were at fault. The proponents of no-fault also claim it

will be possible to reduce insurance premiums by 15 percent.<sup>20</sup>

Deterrence is effective to the degree that it prevents a future accident. It is imperative that the operating mechanisms in any proposed system act so that the causing of an accident maximizes the psychological impact upon the negligent driver even though no injury or major vehicle damage occurs to the instigator.

#### Personal Contacts Measured

In order to compare the deterrent value of the proposed no-fault systems, a list is presented of the contacts between the driver and the system operants. It is assumed that there is no injury.

1. Presumably, the drivers will stop and exchange information as to operator's license and vehicle ownership. The presumption is made although it is difficult to see what function this information could fulfill under no-fault. Since the accident will be attributed to a chance throw of the heavenly dice, there will be absolutely no need to discuss the causation of the accident. This face-to-face meeting, if indeed it would occur under a new system, should prove to be much more pleasant. There would be no accusations and of course absolutely no feeling of humiliation.

2. If a policeman arrives at the scene, he will not be concerned with the circumstances leading to the accident. Under

a new system, this would be a comparatively cordial meeting for the policeman and the two drivers.

3. The filling out of the motor vehicle report, if one is required under a new system, would occasion no particular difficulty. Since legal fault would not be a matter of either past or future contention, there would be no need for even the slightest apprehension in this respect on the part of the negligent driver.

4. The drivers would merely notify the insurance company of the accident. The company representative will not have the slightest concern with fault. In marked contrast to the old system, this would be a much more pleasant experience for the errant driver.

5. For the young driver with a battered jalopy, there would be relatively little expense for his insurance company for the property damage. There would be little chance of an increase in insurance rates. The same would hold true for the owners of heavy commercial vehicles.

6. Under the latest versions of the no-fault system, there would be no further contact with the driver which could possibly relate to causation. Concern with fault, under the limited no-fault plans, would start after the occurrence of a major injury. This would be akin to locking the barn door after the first

horse was stolen. But even then - how good would the lock be?

The limited no-fault plans might be thought to have some psychological deterrent value in regard to truck drivers after they have caused their first injury to the driver of a passenger car (a truck driver is almost never injured in a collision with a passenger car). The deterrent value is dubious because the abandonment of the fault principle, in all except the major injury accident, would diminish if not destroy the group norm which is now in existence in regard to accident causation.

#### MODEL EVALUATION OF FAULT AND NO-FAULT

All of the elements of the system model have been formulated in terms of the parameters which have been derived from and confirmed by the results determined by many different independent investigators. These parameters make it possible to evaluate the comparative value of deterrence which will ensue with changes in the system elements. The following formulation describes parameters of the system model in terms of a mathematical statement.

$$\text{DETERRENCE} = [A + B] \times \frac{[C \times D \times E \times F]}{G}$$

This mathematical statement is a convenient way to show the effect of each parameter upon deterrence. This statement may be likened to a fraction. An increase in quantity above the bar will increase the total value of the fraction and thus will in-

crease the deterrent effect. The fractional value, or deterrence, is lowered when the term below the bar is increased. For example, Parameter G indicates that the intensity of aggression increases as the degree of personal contact between the aggressor and his victim decreases, thus lessening the deterrent effect. On the other hand, Parameter C shows that intensity of influence on an individual's behavior grows as the number of contacts between the individual and the group increases. Increase the exposure to the group standard (Parameter A) and deterrence will be increased by group pressure (Parameter B).

#### Parameters Applied To Systems

It is now possible to evaluate the relative value of the parameters for both the existing and proposed systems.

Parameters A and B posit that an individual's behavior is influenced by group pressure, that there is no "right" or "wrong" group judgment, and that the group judgment tends to conform to the norm which is set up within the group. The law has a limited influence in shaping group beliefs and actions. As was discovered during Prohibition, the law is only effective to the degree that it reflects beliefs which have been established within the group. This principle was demonstrated in a study of vandalism among middle-class whites in the Bronx and Palo Alto.<sup>21</sup> In both cities, automobiles were left across the street from a

university campus, with raised hoods and without license plates. Hidden observers with cameras were placed nearby. In Palo Alto, the car was left untouched for more than a week. But within three days in the Bronx, as a result of 23 separate attacks, the car was reduced to a useless hulk of metal. Most of the attacks were in the daytime and were observed by one or more passers-by, who even occasionally stopped to chat with the looters. The adults were well dressed, giving every appearance of being responsible citizens.

The fault system, as has been demonstrated, constantly injects the group abhorrence of accident-causing driving into every minor and major accident situation. The belief in individual driver responsibility is almost entirely absent in the workings of the proposed no-fault system. As our system model indicates, deterrence will be diminished to the same degree that the belief in individual driver fault disappears among our citizens.

Parameter C posits that the intensity of the influence on individual behavior is a direct function of the number of contacts between the individual and the group. In both systems there are four contacts in the event of a minor accident. In the event of a series of minor accidents in the fault system, there are the additional contacts created by the increased liability insurance payments because of increased accidents attrib-

uted to the driver. If, for example, five payments are made per year, there will be 15 contacts in a three-year period. In the no-fault system these contacts will not be related, in the driver's mind, to his previous faulty driving behavior. Therefore, the increased number of contacts will have no effect on deterrence. Furthermore, if the vehicle in question is an old jalopy, there will be no payouts and consequently no increased payments. For the same reason, there will be no additional contacts for any heavy commercial vehicle - new or old.

In the event of a major injury accident, there will be many additional contacts under the fault system because of the various pre-trial investigations and extensive examination before trial. These contacts will not occur in the operation of a complete no-fault system. They would occur, however, under a limited no-fault plan.

Parameter D, that the norm perceived by the individual during his contacts with the group affects the individual's subsequent solo behavior, will be the same for both fault and no-fault systems.

Parameter E indicates that the intensity of the influence on individual behavior is increased when the individual is singled out by the group. The fault system determinedly singles out the individual in all stages of the system. A no-fault system does not single out the individual and his actions. Under a limited no-fault variant, the singling out occurs only after

a major injury accident.

Parameter F states that the intensity of the group influence on individual behavior is a direct function of the degree of personal contact between the group and the individual.

In the fault system, the degree of personal contact is maximized. Indeed, occasional physical altercations and bitter verbal exchanges as the result of a non-injury accident are common. In a complete no-fault system, the intensity of personal contact will be minimized. The value of this parameter in a limited no-fault plan will be somewhere between these two extremes.

Parameter G posits that the intensity of an aggressive act toward another person is an inverse function of the degree of personal contact between the aggressor and his victim. In the fault system, this parameter will come into effect with respect to potential accidents which may occur after the first accident, of any degree, caused by the aggressive negligent driver. In the complete no-fault system, it will never come into being. In a limited no-fault system, all non-injury accidents are attributed to random chance and thus this parameter will only be effective after a major injury accident.

Model evaluation of the individual parameters for fault and no-fault plans makes self-evident the combined effects. In brief, the fault system maximizes deterrence while the deterrent value of the complete no-fault system is virtually nonexistent. There is only a small amount of deterrence in the

limited variant of the no-fault concept. However, even this diminutive amount of deterrence is of questionable value since the finger of responsibility is pointed at the negligent driver after, not before, the devastating major injury accident.

#### CONCLUSION

With a systems analysis model applied to the relative merits of fault versus no-fault, it is apparent that a change from the present system would lead to increased accidents on our highways. Under fault, institutionalized methods of expressing the censure of the group serve to punish the faulty driver if he continues in his acts. Of key importance, these constant reminders of fault and imposing sanctions are triggered by even a minor accident. There is no such triggering mechanism in the proposed no-fault system. Here, there should be no hint of disapproval on the part of drivers; after all, under the new system, accidents would not be attributed to faulty, aggressive driving. Accident occurrence would be like the gentle rain which falleth from the heavens. Or, as the more sophisticated fatalists would have it--accidents would be little more than the result of random distributions of specific events in a complex social process.

Under a new system, an offending driver would proceed, without concern, from minor accident to minor accident, sooner or later precipitating a major accident which could result in serious

injury or death. Under no-fault, the aggressive truck driver need have no concern about his low factor driving behavior since both he and his heavy vehicle would have ample protection against injury and damage. But this would not be true for the other driver; his smashed vehicle and his mangled body will merely be another entry in the long list of random events occurring in our complex society.

In contradiction of some theorists who claim that since insurance carries the financial burden, fault no longer matters, we have demonstrated that the fault system is of paramount importance because it generates psychological deterrents which keep down the number of accidents. Furthermore, the present system has a built-in financial penalty which inhibits the negligent operation of vehicles. A succession of accidents will cause a large increase in automobile insurance premiums, lower limits or cancellation.

Proponents of no-fault also contend that the criminal law would still exist and that this deterrence would be sufficient. But most of us are well aware that serious criminal penalties result from only a small proportion of all major accidents. In addition, few of us believe that we will be involved in a major accident. Consequently, the deterrent value of a possible future criminal prosecution is remote. A change to a no-fault

concept also would have a decided effect upon police enforcement. Policemen, who are neither saints nor ogres, are busy people burdened with a tremendous number of responsibilities. Many are extremely reluctant to enforce traffic regulations which they consider to be unreasonable or unnecessary. If no-fault were adopted, accident causation would eventually be ascribed to the blind workings of the law of chance--the result of bad luck and not faulty actions of drivers. Since driver fault would be of small importance in causing an accident, police would turn their attention to more demanding problems. A drastic drop in police enforcement of traffic laws would be the inevitable result of any future abandonment of the fault concept.

Independent surveys show that the fault concept is an established group norm, that most people believe that driver fault is the primary cause of automobile accidents. Separate studies also show that when the individual negligent driver is singled out, there is a significant drop in his subsequent accident experience. These studies also show that the more determined the effort, the greater the reduction in accidents. It is also clear that community censure at the significant stage of the minor accident will aid in prevention of those which are major in nature. Studies also support common sense in another way -- aggression will seek out the lowest level of retaliation and will continue to stalk those victims against whom a display of -

aggression will meet with a minimum of reproof. Aggressive drivers meet opposition under the fault system; there is no opposition under no-fault.

Extensive research, therefore, indicates that adoption of a no-fault insurance system would substantially increase the frequency of major automobile accidents. On the other hand, a significant reduction of accidents can be achieved if both individuals and groups accept a higher degree of responsibility for highway safety within the present system.

## FOOTNOTES

- 1 This can be accomplished by amplification. A good example is the operation of a triode vacuum tube circuit. An increase in the grid bias (a greater negative charge), will decrease the flow of current in the circuit. The decreased current activity confirms the blocking effect of the negative grid bias.

- 3 For example, Deutsch and Gerard define a "normative social influence" as an influence to conform to the positive expectations of others. Positive expectations refer to those expectations whose fulfillment leads to or reinforces positive rather than negative feelings and whose non-fulfillment leads to the opposite, to alienation rather than solidarity. A Study Of Normative And Informational Social Influences at 402-11 (Basic Studies In Social Psychology 1965)
- 4 Brown, Techniques Of Persuasion at 45 (1963)
- 5 Formation Of Social Norms: The Experimental Paradigm at 461-71 (Basic Studies In Social Psychology 1965)

6 Another experiment verifying this parameter was performed by Crutchfield. (Conformity And Character at 398-408 (Current Perspectives In Social Psychology 1963).) Five persons were seated in individual booths facing a signal board. The experimenter faked, for each person, the judgments of the other group members concerning the lengths of lines. The experimenter did this in order to deliver unanimously wrong group judgments to each person. (See Krech, Crutchfield & Ballachey, Individual In Society at 508-9 (1962).) The subjects were 90 men actively engaged in a business in which leadership was a salient expected qualification. These men represented a gathering of superior individuals who could be expected to readily withstand group pressure. A control group of 40 men were used. The other 50 were tested as above described. The results were startling. There was a capitulation to group pressure ranging from 30 to 79% in the situations presented.

8 Effects Of Group Pressure On Judgments at 393-401 (Basic Studies in Social Psychology 1965)

9 Ibid

- 10 Note 3 supra
- 11 Ibid
- 12 Further confirmation of Parameter F was a study at the Hawthorne plant of the Western Electric Company. (Kimble, Principles Of General Psychology at 331-332, 352 (1956).) An economic incentive plan gave individual workers a bonus. No increase in production occurred. Next, six workers were selected. They worked under the following sequence of conditions:
- (1) Control condition: Two weeks work in the regular shop under normal conditions.
  - (2) Adaptation period: Five weeks work in a special test room with working conditions otherwise the same as in the shop.
  - (3) Change in the system of payment.
  - (4) Two five-minute rest pauses each day.
  - (5) Rest pauses lengthened to ten minutes.
  - (6) Six five-minute rest pauses.
  - (7) Light lunch served morning and afternoon.
  - (8) Work day reduced by one-half hour.
  - (9) Work day reduced by full hour.
  - (10) Conditions returned to condition 7.
  - (11) Work week cut to five days.
  - (12) Return to condition 3.

Throughout the experiment the rate of production continued to increase. The experiment was structured so that the workers were asked for their comments after each change. They felt management was interested in them. This illustrates the importance of personal contact as set forth in Parameter F. Furthermore, the continued improvement in production, irrespective of the nature of the change, again demonstrates the validity of Parameter C, that behavioral change is a direct function of the number of personal contacts. (See Lewin, Group Decision And Social Change at 427-28 (Basic Studies In Social Psychology 1965) which also confirms Parameter F.)

- 13 Milgram, Some Conditions Of Obedience And Disobedience To Authority at 243-62 (Current Studies In Social Behavior 1965). See also Gamson, The Management Of Discontent 549-50 (Social Psychology 1969) for a summary. Other data from these experiments demonstrate the great influence of the physical presence of the experimenter, confirming again the validity of Parameter F.

## FOREWORD

Criticisms of the present adversary-jury system of determining liability based on fault in lawsuits arising from automobile accidents, and the funding of the results by private insurance, have caused the governing boards of the Defense Research Institute, the International Association of Insurance Counsel, the Federation of Insurance Counsel and the Association of Insurance Attorneys to study those criticisms. The study results in the firm conclusion that every litigant is entitled to a fair trial in a court of law and to have his case presented by his attorney according to rules of law.

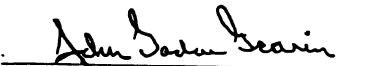

The objective of law and court trial is to attain the nearest human approximation of truth. Such an end is most likely to be gained by contest where opposing attorneys, committed to the causes of their clients, present the best possible evidence for consideration by jurymen who reach decisions through argument and counter-argument. Such a fundamental process should not be replaced by some system of compensation which rewards all injured regardless of fault. The moral principle of reward for good and punishment for wrong is universally accepted and justifiably so. This principle should not be weakened. Administrative decision which determines the rights of litigants is not an adequate substitute for the thorough means provided by the courts. Such a substitution can only be expedient rather than remedial and would be recognized as an omen of governmental rule which is not the path of a free people with full rights based upon Constitutional guarantees.

This paper is not a plea to maintain the status quo. Change is an inevitable feature of the Twentieth Century. Therefore, if threats to the adversary system are to abate, they must be countered by positive action programs rooted in defensible principles. This Positive Program paper sets

forth such principles, the implementation of which calls for dedicated effort of the legal profession, the insurance industry, the business community, the legislatures and the public. Need of such implementation is urgent; freedoms and rights, once lost, are difficult if not impossible to regain. To this end, the undersigned pledge themselves and their organizations to a continuing program of improvement in the administration of justice.

## JUSTICE IN COURT AFTER THE ACCIDENT

### A Positive Program For Its Retention And Improvement

#### I. INTRODUCTION

This position paper, issued in the public interest, supports retention and improvement of the adversary-jury method of determining civil disputes in common law courts with liability based upon a finding of fault. Trial by advocacy, defined as putting issues to the proof by attorneys who plead or defend the causes of their clients, is favored. This system has served our civilization well. Its troubles are not inherent; they are peripheral. Some of its problems result from:

1. A growing population and expanding economy;
2. Growing claims consciousness, resulting in an excessive number of nuisance cases;
3. Unwarranted refusal to settle meritorious cases;
4. Questionable tactics to secure large and undeserved awards as damages;
5. Public and legislative apathy to existing problems, notably insufficient judicial personnel, inadequate court facilities, and failure to enact adequate traffic safety programs.

In this position paper it is suggested that evolutionary not revolutionary means will supply the answers. The aim is to stimulate public and private agencies to positive action programs, aided by lawyers and judges whose skill and experience can supply guidance and leadership.

5

## II. COURT CONGESTION AND DELAY

### 1. A Problem for the Legal Profession

The Bench and the Bar have the primary responsibility for completing studies and introducing changes and innovations needed to relieve existing court congestion. They are qualified to streamline court procedures and to expedite the disposition of litigation in all areas. They must give needed leadership.

### 2. Congestion Localized in Few Large Urban Centers

Court congestion and court delay are related but not identical conditions. Court congestion exists in a few large metropolitan centers where inadequate facilities, insufficient personnel and some reluctance to face the problem are principal causes. Court delay exists wherever inefficiency or indolent disregard for responsibility allows court procedures to be mismanaged.

Initial studies should first pinpoint the cities which have unseemly delay, should determine the volume of personal injury cases compared to other types of cases, and should ascertain if court practice defers personal injury lawsuits in favor of trying other actions, criminal or civil. In addition, to gain a clear picture of possible court congestion, revamped statistical methods of measurement should be employed. These include: (a) Measuring time from certification of readiness for trial by opposing attorneys rather than from the filing of a lawsuit; (b) Discarding the use of a national average since only a few urban areas have delay, some locales have modest time lapses between certification and trial, but most are disposing of litigation within a reasonable time; and (c) Viewing delay in any area in the light of rules that allow hardship cases to be advanced for trial.

Court congestion, where it exists, can be eliminated by the following measures:

- (a) Providing one judge for every 50,000 of population.
- (b) Employing more scientific methods in trial courts (e.g., use electronic data processing systems to speed progress of cases on the trial dockets).
- (c) Stressing to the public and their legislative bodies the dangers of "business as usual" in courthouses that are too small, inefficient, inadequate, understaffed and lacking in judicial facilities. Additional public funds are needed to correct such conditions.
- (d) Utilizing other remedies discussed in this paper (e.g., efficient use of legal effort and better court administration. See page 10, section 5 and page 16, section 4).

To relieve delay and congestion, the strengths of all legal bodies are needed to design programs for improvement of the adversary-jury system rather than dissipating those strengths through seeking answers in new, untried and patently weak systems.

### 3. Highway Safety

In addition to the tragic loss of human life, public disregard of highway safety is also a principal contributor to growth in accident claims and resulting court congestion. The following are recommended:

- (a) Lawyer groups at the state and municipal levels should act as specialists to reduce highway accidents. Pertinent are recommendations to improve court practices regarding driving offenders and repeaters; provisions for better licensing; laws which aid the obtaining of evidence, such as implied consent when drunken driving is suspected; and more effective enforcement of laws governing drivers. Uniform state

traffic laws are needed in this age of extensive travel.

Political failure of highway safety programs, which has been the record to date, can be reversed when such programs are actively promoted and supported by influential citizens, the judiciary and the legal profession.

- (b) Since the insurance industry is spending millions of dollars on highway safety, it should tell its story more fully to lead state legislatures and citizens' groups to solutions which would reduce the toll of deaths and injuries. Highway accidents also cause larger insurance losses, directly increasing the amount of premium dollars that come from the pocket-books of family car owners who provide the pool of insurance dollars.
- (c) Fine programs of highway safety have been and will be devised, but when disregarded by the public and the enforcement agencies of government, the slaughter continues. Legislators, assuming their proper roles as makers of governmental rule, must enact laws that are enforceable and will be enforced. The chief executive of a state can be the key to priming a safety program which leads to legislative action. Through him suitable public support may be gained when joined with the publicity of citizens' organizations.
- (d) To date, much emphasis has been given to faults of the machine. Although automobiles and highways need improvement, statistics plainly show that the main cause of highway accidents is the driver. The following need stress in any highway safety program: (1) Driving is a privilege; not a right; (2) Uniformity and more rigid licensing standards are needed, including periodic physical examinations, driving tests and car inspections; (3) Adequate numbers of

trained officers are required to police efficiently; and (4) Rigid enforcement by the judiciary must complement police action to curb violations of traffic laws. Removal of unqualified drivers and law violators from our highways can be accomplished only through full cooperation of our courts.

- (e) Action is demanded to gain proper financing for highway safety. State and local governments now divert highway user revenue to non-traffic purposes. Safety functions, not road construction and maintenance alone, must gain adequate funding.

#### 4. Claim Growth

As the population and the economy have grown and the number of motor vehicles in use has expanded, the number of accident claims has increased proportionately. Claims consciousness has also developed; with it have come those who believe that if one's person or property is injured, someone else ought to pay, regardless of who caused the loss. Also, in a few areas of law, the concepts of strict liability and liability without fault have been blessed by some courts.

To meet these conditions, it is the responsibility of the Trial Bar to gain fair and just compensation for deserving claimants, based on the established legal principles of liability only as a result of fault. Claimants and their counsel must realize that one who has suffered harm may press his claim to the full amount of his actual loss, but he has no right to demand or obtain more. Defendants and their counsel must be willing to make prompt and reasonable payment for every valid claim where liability exists. All must work together to expedite court proceedings and to eliminate unreasonable delays. The following are suggested:

- (a) Through plaintiff and defense attorney cooperation, the utility of settle-

ment discussions can be increased vastly. "Bargaining" positions ridiculously above or below a fair compensation figure waste time and effort.

- (b) False or exaggerated claims presented by clients should be discouraged promptly in the attorney's office.
- (c) When it is shown that non-meritorious suits have been filed, court rule or legislation should assess costs and attorneys' fees against either the unsuccessful plaintiff or his attorney. When defendants engage in like tactics, a similar result should follow.
- (d) If fraud or perjury are discovered during trial, the judge who is responsible for discipline in his court should refer the facts to the Bar Association having jurisdiction to discipline counsel involved, and to the District Attorney for the prosecution of witnesses where appropriate. It is also hoped that the medical profession, through its national and local organizations, will invoke disciplinary measures when fraud and perjury are discovered in medical testimony, reports and fees.

#### 5. Efficient Use of Legal Effort

To further reduce time lost and to improve the efficiency of the courts, there are various considerations for lawyers and judges that are pertinent to court delay and court congestion:

- (a) Judicious use of pre-trial and expanded use of pre-suit offers of judgment, with appropriate sanctions for nonacceptance, would eliminate many trials.
- (b) Time and effort would be saved if trial courts would develop a firmer attitude in granting motions for summary judgments, directed verdicts and nonsuits when warranted. Appellate courts should encourage trial

judges to exercise independent judgment in these areas.

- (c) Programs should be devised by the Bench and the Bar to relieve case overload of both plaintiff and defense law firms so that trials are not delayed by a shortage of trial lawyers.
- (d) Judges and lawyers might well seek information from qualified experts in order to update court practices and to apply modern scientific knowledge to court procedures.
- (e) Courts should make greater use of university graduates schooled both in business and in law to act as court administrators.
- (f) Lawyers could be used as "bar proctors" to work with judges to schedule and expedite trials.
- (g) Overlapping and inefficiency of some court systems can be relieved by effective planning (e.g., the administrative assignment of cases and judges according to existing workload, and making use of judges from less busy courts in rural areas to relieve urban court pressures).

#### 6. Need for Public Support

The common law system of an independent judiciary and jury trials in civil litigation have functioned well for centuries and deserve total support. But **deserving** public support and **having** public support are not the same. Such support may be enlisted through the following:

- (a) Judges should not need to depend upon political fortune to gain and retain office. Legislation is needed to free them from politics and to insure that the selection process is not politically "tainted." The public requires assurance that the most competent and honest men have been elevated to the bench.
- (b) Every citizen should be reminded of the value of the jury system to so-

ciety and encouraged to serve as a juror when called so verdicts will truly be by one's "peers."

- (c) News media should tell the public of the history and method of operation of our courts, the judiciary and the American system of administering justice.

### III. INSURANCE ECONOMICS

#### 1. Need for Insurance

In our private enterprise system, casualty insurance is necessary both for the individual and for his business ventures; without insurance, free enterprise could not exist. A healthy insurance industry is essential to our economy. No man can guard against all of today's threats to his financial security. Insurance provides the necessary protection for him and his family and shields him from catastrophe.

American business, now in the most evolutionary period in history, is bringing new products to the market each day and is engaged in multi-billion dollar programs of research and development. In this space age, the insurance industry plays a most important role in protecting the manufacturer against losses resulting from his new products and developments. For the businessman or any individual, premium costs have a direct relationship to loss experience.

The public will lose if casualty insurance is not available or premiums are too high. It is in the public interest that the casualty insurance industry continues to function, earns a fair profit and maintains its proper place in private enterprise.

#### 2. Automobile Insurance Losses

Since 1955, casualty insurers have faced losses in the automobile bodily injury field and have been hard pressed in the automobile property and physical damage

areas. For 13 consecutive years, stock companies alone have recorded statutory losses of about \$1.5 billion on \$25 billion automobile bodily injury premium volume. Fighting for survival, insurance leaders are seeking remedies to reduce exorbitant losses and costs. Some leaders are interested in suggested alternatives to the adversary-jury system for dealing with automobile accidents, seeking both reduced defense costs and lesser claim payments.

A well publicized scheme of automobile compensation entitled "Basic Protection for the Traffic Victim" would reward injured parties, regardless of fault, up to \$10,000 for a single accident, with recovery for pain and suffering only when it exceeds \$5,000 in value. Fair analyses of this and earlier proposals reveal that they are unsatisfactory and inequitable to both the motoring public and the injured person.

In an attempt to find solutions to increasing costs, one insurance group is experimenting with a plan that offers a choice—coverage which provides guaranteed benefits up to a stated amount, or an alternative plan, which relies upon the fault concept for relief of damages. Such a plan, once adequately tested, can then be evaluated against the present system.

The sponsors of this paper doubt that the public would accept a system arbitrarily restricting injured claimants to recovery of their actual out-of-pocket wage and medical losses, or less. People expect some payment for the inconvenience and discomfort of being injured, especially in accidents caused by persons who break the law or drive carelessly. The principle that people ought to be held responsible for their wrongdoing is deeply ingrained in the public sense of justice. Similarly, the principle that one who is free from fault should be liable to one whose fault caused his own injuries is foreign to both moral law and modern thought. The fault concept is not outmoded.

### 3. Cost Savings

While the casualty insurance industry faces economic problems in the automobile tort field, economies and cost-saving programs are presently within the control of the industry itself:

- (a) Economic advantage lies in resisting non-meritorious claims. Court congestion and delay will be reduced. Payment of "nuisance" claims leads to an epidemic and may deny the conscientious plaintiffs' attorney the choice of advising a client that his claim is worthless for fear that the client will seek another lawyer who is less scrupulous.
- (b) To better serve the public, costly inter-company disputes could be resolved by arbitration rather than litigation. Such programs employing skilled and trained professionals are available.
- (c) The advice and assistance of defense lawyers can improve "in service" training programs for claimsmen, agents and investigators so that they become more efficient and effective.
- (d) Through frequent and adequate communication with defense counsel regarding the problems of insurance management, mutual understanding and problem solving could be improved.
- (e) Public relations activities can be coordinated to develop a proper public attitude toward the growing number of unmeritorious claims and could "spot light" the true nature of suggested "reforms" which are actually inimical to the insuring public.

## IV. LEGAL ETHICS AND ECONOMIES

### 1. Inflation

Inflation is not limited to goods in the supermarket where it is readily noticed by

the buying public. Inflation affects costs of defending accident claims which are suspect or without merit, in terms of investigation, insurance personnel, defense lawyer fees and trial costs. Such costs are paid by the premium-paying public.

### 2. Ethics

As officers of the courts, lawyers have a professional responsibility to make every lawsuit a search for justice. They have a duty to encourage fairness, reasonableness and moderation on the part of courts and juries. Any legal philosophy that is entirely one-sided is irresponsible.

The American Bar Association Canons of Legal and Judicial Ethics provide reasonable professional guidelines for lawyers and judges and should be effectively enforced by Municipal and State Bar Associations and the Judiciary. Without adequate enforcement, a great profession will fall into disrepute, heavier burdens will be imposed upon the courts, and the public will suffer.

Contingent fee abuses relating to the "brokering" (fee-splitting) of cases among lawyers and the continuation of "ambulance chasing" are subjects which require constant attention from the organized Bar. Through such activities, unfair advantage may be taken of injured persons and target defendants. Unethical practices should be eradicated to assure that the injured party receives just compensation for his loss. Full disclosure of the fee-splitting arrangements and the judicial regulation of contingent fee contracts are essential to prevent abuse and the possible victimizing of the injured claimant.

The practice of demanding exorbitant amounts in the initial *ad damnum* pleading should be curbed. Such practice influences public opinion and thus the minds of both present and future jurors.

Cases should not be decided by a judge's individual sense of "social justice." Judicial "legislation" resulting in decisions not

based on common or statutory law, provokes litigation and renders justice uncertain.

### 3. Defense Economies

Attorneys admittedly owe diligence to their clients, but in the interests of economy not all cases demand exhaustive measures. Suggestions for more efficient use of legal effort include:

- (a) "Run of the mill" cases should be handled expeditiously and with as little expenditure of time as is possible, consistent with sound legal practices. Fees and costs of handling are important factors in reducing overall case costs.
- (b) Discovery procedures, depositions, medical examinations and other pre-trial preparations should be adapted to the needs of each case, not used indiscriminately or routinely.
- (c) Defense counsel are obliged to be aware of services that are available to reduce defense costs (e.g., DIO Brief Bank) and to make use of such facilities.
- (d) Closer coordination among defense counsel, home office counsel and claims adjusters as to when claims should be settled, resisted, or advanced for trial can increase efficiency.
- (e) To improve efficiency and the efficacy of their service, defense lawyers need to be fully informed of the latest significant decisions and the newest trial techniques. Membership and participation in the work of defense groups on local, state and national levels is essential.

### 4. Judicial Improvement

A lawsuit's purpose is to ascertain truth and to do justice. The trial judge has a leadership role which, if undertaken and

performed, will improve the quality of justice obtained in his court.

The work of the trial lawyer includes more than representing his client in a particular case, and the work of the trial judge involves more than just presiding at a trial. Organization and administration of the court, assignment and expediting of cases, conducting pre-trials as well as trials, studies and conferences as to procedural improvements—these and many other duties are included in a judge's work.

There is probably no practical way to train lawyers to be judges, but the judges themselves have recognized that methods are required to train them to be better judges. Continuing education for trial judges and opportunities to stay abreast of current developments should be readily available. The work of the National College of State Trial Judges is an excellent beginning, but much remains to be done. These approaches are suggested for consideration:

- (a) Flexibility in reassigning judges should be maintained to meet the demands of case loads.
- (b) Where delays exist, state and local bar associations should recommend actions pertaining to the work of judges, the number of days that courts should be closed, and length of judicial vacations. Unreasonable variances should be eliminated.
- (c) Legislation should provide adequate salaries for judges to attract top talent to these offices. Adequate pensions should be arranged so that compulsory retirement at an appropriate age will be equitable.
- (d) Procedures should be provided for ready removal of judges who refuse to perform their duties or who become incapacitated.
- (e) Capable court administrators assigned to multi-judge courts can improve efficiency of the judicial process

without adding more judges in every instance. This practice, used in some areas, needs to be expanded.

## V. THE PUBLIC IMAGE OF COURTS AND JURIES

### 1. Need for Public Information

Judges and lawyers must constantly scrutinize their own work and try to improve it, but should remain aware that negative criticisms, not accompanied by positive programs, will cause negative reactions outside their immediate circle. It is difficult for the public to applaud a system which is decried by those charged with the responsibility for its operation. However, to date there has been no public outcry against the adversary-jury system. The public recognizes the value of courts, lawyers and judges and the moral values for which they stand.

It is important, therefore, that trial lawyers who understand the adversary-jury system present information programs for laymen and other lawyers so that this trust and confidence continues. Such programs should be straightforward explanations of our system of jurisprudence and should delineate the public significance of adversary-jury trials. Public participation in improving court operations should be encouraged, with adequate leadership supplied by those who are knowledgeable.

### 2. Cost of Jury System

Some contend that juries are too costly. They claim that the longer trial time involved in jury cases increases the expense for litigants and the public. Facts do not support this charge. For example, in the fiscal year ending May 31, 1967, jury expense amounted to only 13 percent of the total cost of the New York State judicial system.

Fundamentally, the cost of justice should not be the yardstick for its effectiveness,

unless its cost renders justice unattainable. Using cost as a reason for changing a proved system is expedient as well as false. Cost comparisons of the judicial against the legislative, at either state or federal levels, will show the weakness of this criticism.

### 3. Juries and Delay

Existing delays in the jury calendars of some courts are not attributable to any innate defect in the jury system, but rather to the volume of litigation, inadequate facilities and insufficient personnel. The addition of more judges in crowded areas, and procedural reforms in jury calendar practice will improve the situation. Efficiency of court administration is a goal to be achieved. Improvement of the present system is more economical than developing a new one.

### 4. Jury Verdicts

Critics contend that juries are ill suited to make accurate findings of fact or to comprehend and apply a judge's instructions. Empirical studies, however, show that juries usually reach fair and just conclusions, and that juries ordinarily will not disregard established law in favor of their own concepts of justice. Most experienced trial lawyers are convinced that nothing yet conceived is more likely to produce just results than the jury trial. In addition, the jury serves an important function in assuring judicial impartiality and affords an unequalled opportunity for citizens to participate in an important governmental activity.

### 5. Jury Composition

Juries are not selected because of political "ties" and thus are able to counter "political connections" of litigants or counsel. Jurors, when chosen from all walks of life, constitute a cross-section of the populace and function as the conscience of the community. They bring a fresh outlook

into the case and exhibit interest and responsibility. At the minimum, the juror is entitled to the following consideration:

- (a) Adequate compensation for his service supplemented by the support of his employer in paying the difference between jury fees and his regular compensation.
- (b) Proper facilities to supply reasonable comfort.
- (c) Efficient court administration to avoid wasting his time when called for jury service.

Properly selected and dealt with, jurors will promote the adversary-jury system enthusiastically.

#### 6. Judicial Quality

A prime concern of lawyers and the people should be that the referee of the courtroom, the judge, be provided with all possible service and skills to help him to maintain and improve his abilities for the good of all. Judges are concerned with performance and, by the nature of their occupation, should be interested in evaluation of their work. Means should be devised whereby the over-all work of judges can be evaluated by qualified persons.

Awards, publicity or other practices honoring judges should be carefully restricted by donors and recipients to avoid any implication of favor or bias.

#### 7. Legislative Pressure

No pressure group should seek legislation which is inimical to the public interest. Lawyers should avoid sponsoring bills that have no merit except to increase lawyers' incomes. Claimants should avoid legislative campaigns to eliminate legitimate defenses in tort actions. Defendants should not press for laws that would unfairly impede recoveries by persons who have meritorious claims. Trial lawyers representing

both plaintiffs and defendants who combine their efforts in the public interest can provide worthwhile leadership in corrective legislative programs.

## VI. THE PUBLIC IMAGE OF CASUALTY INSURANCE

### 1. Need for Public Information

It is essential for the public to understand that personal injury judgments against insured defendants are paid by hometown dollars in the form of premiums. As judgments increase, premiums must also increase.

Judgments will be increased if legal limitations on tort recoveries such as contributory negligence, assumption of the risk and immunities, are removed arbitrarily and without adequate consideration being given to the public policy inherent in such limitations. Information on the actuarial concepts involved in fixing rates and the impact of large settlements and judgments on the premium to be paid must be put forth with clarity and frequency. The casualty insurance industry has an important story to tell. This story includes the low level of cancellations; the relation of insurance rates to the rising costs of auto repairs, hospital and medical bills; auto thefts; and the beneficial growth of uninsured motorist coverage. Too many persons lack understanding of casualty insurance and its role in American life. Proper understanding will lead to full support of this industry and its objectives.

### 2. Criticisms of Present System

Criticism has been directed to the present tort reparations system because of the method and manner of payment, alleged delay in payment and because of practices relative to risk selection and rejection. An analysis of these criticisms would indicate that many are unfounded and that insurers are moving toward correction of any existing deficiencies:

(a) Critics say that a claimant should not be allowed to recover two or three times for the same injury from collateral sources. This practice creates "windfall" situations which encourage claims, leading to over-compensation. Various groups are attempting to focus attention on this problem so that unwarranted double payments for tort damages may be eliminated.

(b) Critics say that lump sum payments to claimants do not consider future problems and hardships of the injured. The new insurance technique of employing open-end releases allows consideration of future financial need. (See page 23, section 3.) While a few injured persons are incapable of handling large sums of money which are given to them suddenly, in most instances the insurer, the Bench and the Bar can protect and assist the injured recipient.

(c) Criticisms relative to risk selection, rejection of applicants, and cancellations usually ignore past records of some insureds that establish them as bad risks or persons to be rejected, particularly in the automobile insurance field. Some drivers have habitually bad records, thus imposing upon the society which allows them to operate on public roads. Related to these charges are complaints regarding insurance company insolvencies. The industry is justly jealous of its reputation which must not be tarnished by the disreputable few and is vigorously seeking cooperative legislative and industry solutions.

(d) Another criticism is that, because of intentional delay by the defense, some claimants are forced to settle for too little money. Insurance companies sustain severe losses when litigation is delayed. They and their defense counsel decry unreasonable

delays which merely add to trial costs and complexities. Delay is the exception, not the rule. Statistics show that all but two or three per cent of personal injury claims are settled without trial to verdict, presumably to the satisfaction of all concerned.

### 3. Modern Insurance Developments

Critics who say that insurance coverages do not meet modern times and needs are unaware of recent developments. Expanded medical pay coverage and uninsured motorist protection are but two examples of the insurance industry's efforts to meet the increased needs of the insuring public.

A "heart" has been put into the insurance industry through new concepts of settlement techniques. In addition to advance payments to the injured so that they may meet current expenses before final settlement of a claim, open-end releases are used which take the future into consideration, and rehabilitation programs attempt to restore the "whole man" to society. Insurance companies also offer accidental death or dismemberment coverage to the driver and members of his family, good driver plans, non-cancellation and renewal guarantees so that virtually permanent automobile coverage is offered at rates tailored to the type of driving and to the accident record of the individual insured.

Consideration should be given to seeking broadened coverage of the medical pay endorsement, with subrogation or set-off provisions, to include third parties not riding in the vehicle and to cover loss of income. Immediate settlements under medical pay and income protection coverages, apart from any connection with a possible liability suit, should become standard industry practice. Equally beneficial would be broadened uninsured motorist coverage to include pedestrians and other third parties.

## VII. RESEARCH AND STATISTICS

While many of the programs discussed in previous pages can be started or completed on the basis of common sense, information already available and principles and ethics which are firmly established, others cannot progress solidly until adequate statistics are available. With the development of statistical research in the accident claims area, a further evolution of needs for improvement of the tort-fault system, as funded by private insurance can be made. Reforms and improvements can then be based upon facts to protect the public interest. Research should center on the following:

### 1. Claim Amounts

Statistics are needed on amounts paid in claims (a) before and after lawsuits are filed, (b) where claimants are or are not represented by counsel, and (c) where proof of injury or liability is lacking or dubious.

### 2. Counsel Fees

Studies should disclose fees paid to defense counsel (a) for opinions where no lawsuits are filed, (b) where cases which have received minimal handling by counsel have been settled, (c) for the various preparation phases of litigation where the cases are settled without trial, and (d) when actual trial takes place.

These statistics should be categorized, for urban versus rural areas, and for courts where the dockets are current as compared to those that are delayed. A comparison is needed between companies which follow "hard" versus "soft" settlement policies. Additionally, statistics on a national basis are desired concerning the amounts paid in contingent and brokering fees, as well as the net recoveries to claimants so that these can be related to the problem of claim costs.

### 3. Claim Costs

Statistics should be compiled which compare, industry-wide, the allocated and unallocated costs of (a) claim settlements; (b) trial; and (c) denial of claims liability. These should separately state costs when insurance house counsel are used, compared to fees paid private lawyers. Loss ratios for each method should be made available.

### 4. Accident Costs Statistics

Further studies would have particular application to costs and to improvement of the adversary-jury system:

- (a) Desired is a compilation of the dollar range of claims for serious injuries or deaths in which the claimant is paid nothing, classified by age and sex.
- (b) A study is required of the national loss, both social and economic, of injuries and deaths from automobile accidents. This study should extend beyond the immediate families to all those affected, whether compensated or not.
- (c) A time-cost study of the workmen's compensation system as compared to the tort law method would provide the basis for future action within and outside of the insurance field.
- (d) The national results of claims, resulting settlements, and lawsuits in the personal injury field are not known. Valuable information would include:
  - (1) The number of lawsuits tried, the amounts of the demands, and the range of the verdicts;
  - (2) The number of claims settled without lawsuits, the dollar ranges, and stages at which agreements were reached;
  - (3) The number of injury or death claims resulting from automobile

accidents, which are presented annually, where fault is clear, doubtful, or nonexistent;

- (4) Analysis of the time lapse before settlements were achieved, with comparisons shown before and after lawsuits are filed.

### 5. Fault Impact

With the aid of psychiatrists, psychologists and others closely engaged in highway safety efforts, an attempt should be made to provide detailed analyses to show whether the concept of liability based on fault is a significant factor in highway safety. If so, is there any relationship to the limits of policy coverages, to premium rates or loss of insurance coverage?

## VIII. CONCLUSION

Much has been accomplished in relieving court congestion, improving efficiency in court administration, expanding insurance coverage, reducing costs of claim handling, expediting settlements and increasing the net amount received by injured claimants. More remains to be done by the cooperative efforts of the Bench, the Bar, the legislative and executive branches of government, the insurance industry and the public. These efforts will redound to the benefit of the American people by the preservation of the public's right to a jury trial in civil litigation and liability based on fault.

The adversary-jury system should be retained. Reasoned advances will be accomplished if the foregoing suggestions are acted upon. If those so deeply concerned will offer their time and resources, the achievement will be entirely worth the effort. The sponsors of this paper pledge to do all that they can to implement these suggestions, within the limitations of their resources.

## Introduction

**T**HIS IS an age of criticism, particularly of existing principles, values and institutions. All too often a system or institution is criticized for imperfection, not due to basic flaws in the principles upon which it is based, but caused by the fallibility of those who operate the system. Too often, critics seek a new and idealistically perfect system rather than responsible reform to correct imperfections which exist in an otherwise workable system.

Those who have proposed radical change have a relatively easy task, especially if what they have proposed is nothing more than a theory never tested in actual practice. The flaws of the existing system — whether imagined, exaggerated or real — are emphasized. Those who come forward to point out practical and philosophical problems in the application of revolutionary change are characterized as unobjective defenders of the status quo. Those who come forward with reforms to cure the actual ills of the existing system, rather than with something untried and untested, are often placed in the same light.

So it has been with the present liability reparations system, especially as it relates to the compensation of those injured in automobile accidents. The entire system is based upon a principle which has been basic to society since its inception — one who causes injury to another should fairly and adequately compensate him for that injury. Those who criticize the system and propose that it be discarded in favor of some untested alternative do not directly attack this principle. Rather, in proposing their alternatives, they attack the manner in which the system is operated. They claim it is too slow. Yet, they disregard obvious measures which could be taken to expedite the process. They claim it is too cumbersome. Yet, they overlook steps which could be taken to modernize and streamline its procedures. They argue that the system is too costly. Yet, they pay little

attention to obvious means of reducing cost. At every turn reform is lost in the rush toward revolution.

At an early date, defense lawyers began to study the problems which faced the liability reparation system and the proposals which were offered for change. Much time and effort were expended to demonstrate that many of the criticisms of the system were untrue or exaggerated. Also, the shortcomings of proposed plans were made known. Through this process of study and analysis it was found that some problems in the operation of the present system actually do exist. However, it was clearly demonstrated that these problems could be corrected within the framework of the present system and without the need to destroy the basic principle upon which it is built.

In January of 1968 the Defense Research Institute, International Association of Insurance Counsel, Federation of Insurance Counsel and Association of Insurance Attorneys issued a position paper, **JUSTICE IN COURT AFTER THE ACCIDENT**, which outlined areas in which improvement of the present system could be achieved. The proposals set forth herein are a continuation and amplification of the work which began with that special report and were prepared and are offered for consideration by the Defense Research Institute. They are endorsed in principle by the other three defense associations with the recognition that differences of opinion among the membership of the various groups may exist as to specifics contained within some of the proposals.

We are here concerned with implementing the recommendations contained in **JUSTICE IN COURT**. This is by no means a "plan" as that word has come to be used in reference to certain automobile accident reparation proposals. It

is rather a compilation of specific suggestions for improvement of the present system — improvement based upon the realization that the principle underlying the entire system is valid and should be maintained. These proposals can provide a vehicle for experimentation within particular states which, if successful, can then be utilized in other jurisdictions.

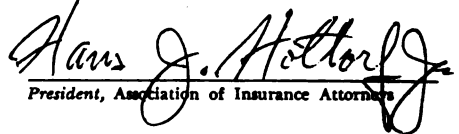

The eleven proposals which follow are directed at some of the most basic problems which are claimed to exist in the operation of the present system. In most instances, sample legislation is also set forth to assist those interested in implementing the proposals. What is sought is to make the present system less costly, more expeditious and more efficient. We do not suggest that the proposals are a panacea.

Other groups, including the American Bar Association, have studied the problems and have proposed programs of responsible reform within the framework of basic legal doctrine. These should be examined and implemented when they are found to have merit. We will lend our support to the implementation of these proposals and any others which are meritorious. We will also re-examine our recommendations in the light of future developments and will modify or change our proposals if events indicate that the public interest merits such action. But our work will not stop there. More can be done and needs to be done and therefore we will make additional positive suggestions and proposals from time to time. Reform is a journey which has no final destination.

  
President, Defense Research Institute

  
President, International Association of Insurance Counsel

  
President, Federation of Insurance Counsel

  
President, Association of Insurance Attorneys

October, 1969

## Summary Of Proposals

The following proposals are made for improvement of the personal injury reparation system:

	<i>Page</i>
<b>HIGHWAY SAFETY:</b> Through the development and implementation of specific research programs and legislation calling for: (1) mandatory license revocation and fines for those convicted of operating a vehicle while under the influence of alcohol or drugs; (2) permanent revocation of driving privileges for habitual moving traffic law violators; (3) severe penalties for pedestrians involved in motor vehicle accidents while under the influence of alcohol or drugs; (4) uniform licensing standards for drivers with periodic physical and mental examinations and testing; and (5) mandatory use of motor vehicle safety equipment including safety belts and motorcycle safety helmets; and the support of programs and proposals of others, efforts will be made to reduce the highway accident tolls by concentration upon motorists as a prime cause of automobile accidents .....	7
<b>FIRST PARTY COVERAGE:</b> That each automobile insurer offer its insureds the option to acquire minimum first party coverage for medical and hospital expenses, uninsured motorist protection, income disability and accidental death benefits for economic losses resulting from motor vehicle accidents. This insurance should cover the named insured, members of his family residing in his household, and guest passengers injured while occupying the insured vehicle .....	11
<b>COURT CONGESTION AND DELAY:</b> Through appropriate legislative action means should be established to: (1) provide a sufficient number of judges to keep abreast of the increasing judicial work load occasioned by population growth; and (2) mandatory arbitration of all suits which involve claims under \$3000 should be employed in jurisdictions troubled with court delay. Through additional research the root causes of court delay will be isolated in those jurisdictions in which it exists .....	14
<b>CONTINGENT FEE REGULATION:</b> Contingent fees and procedures for their use should be regulated in the following manner: (1) the amount of the fee should be strictly regulated by appropriate local court rule or legislation; (2) every retainer on a contingent basis should be in writing in a fixed format and signed by the client; (3) a retainer statement should be filed with the appropriate judicial authority by the attorney after its execution; (4) there should be strict control of the division of fees between attorneys based upon work performed; and (5) upon completion of the claim or suit an attorney should file an itemized closing statement with the proper judicial authority and deliver a copy to the client .....	18
<b>COLLATERAL SOURCES OF RECOVERY:</b> That the Collateral Source Rule be modified so that evidence of the nature and extent of all benefits and services received or to be received by the claimant as a result of the alleged injuries and damages be sustained be admissible. That evidence of the remarriage of a surviving spouse be likewise admissible in an action for wrongful death .....	21
<b>COMPARATIVE NEGLIGENCE:</b> That the determination of whether the rule of contributory negligence should be abandoned is a matter for local determination. However, when the rule is to be changed, the present Wisconsin Comparative Negligence Rule and Procedure is preferable and should be substituted .....	23

- ADVANCE PAYMENTS:** That liability insurers be given the right to make advance payments for economic loss to claimants without the possibility that the claimant will be allowed to introduce evidence of the advance payments on the issue of liability during subsequent litigation. That liability insurers making advance payments be allowed to take a credit therefore against any subsequent judgment recovered by the claimant or settlement made with him .....24
- ELIMINATION OF AD DAMNUM:** That any pleading demanding relief in the form of unliquidated damages may only make a prayer for general relief and state that the amount claimed is within the minimum and maximum jurisdictional limits of the court .....25
- FRAUDULENT CLAIMS:** That strict sanctions should be imposed upon those who intentionally make claims for personal injury or property damage known by them to be false or fraudulent and upon those who assist in the making of such claims with knowledge of their false or fraudulent character .....26
- EFFICIENT USE OF LEGAL EFFORT:** That those practices and procedures which provide for limitation on the right to voluntary dismissals or non-suits, the right to a split trial on issues of liability and damages, modification of appeal bond rules, summary judgment, mental and physical examinations of litigants, demands to admit the genuineness of documents or relevant facts, and offers of settlement, judgment and damages should be adopted in those jurisdictions which do not have such rules and also in those jurisdictions whose present rules are not as workable as those which are proposed .....27
- REGULATION OF AWARDS FOR PAIN AND SUFFERING:** That an attempt be made to formulate a plan which will serve as a guide to the appraisal of fair compensation for pain, suffering and inconvenience which results from the injury sustained through the fault of another .....32

# Highway Safety

## PROPOSALS

1. DRI and other concerned defense lawyer groups have sponsored scientific research to determine the effect which the adoption of a no-fault auto compensation plan would have upon highway safety. The preliminary research demonstrates that the abolition of fault in determining civil liability will result in an increase in the frequency of automobile accidents. DRI will make the results of this research available to those who are interested in this subject and other meaningful research of a similar nature will be supported.
2. The following traffic safety legislation will be supported:
  - a. Mandatory license revocation and severe fines for those convicted of operating a motor vehicle while under the influence of alcohol or drugs.
  - b. Permanent revocation of driving privileges for those motorists who are found guilty of habitual moving traffic law violations.
  - c. Severe penalties for pedestrians who are involved in motor vehicle accidents while under the influence of alcohol or drugs.
  - d. Uniform licensing standards for all drivers, coupled with a requirement for periodic physical and mental examinations and testing of drivers.
  - e. Mandatory use of motor vehicle safety equipment including safety belts and motorcycle safety helmets with penalties for nonuse and provisions calling for nonrecovery for injuries incurred which could have been prevented through use of such safety equipment.
3. In addition defense lawyers will lend their support and energy to assist in programs that call for:
  - a. Establishment of an improved system to identify those repeatedly involved in automobile accidents so that those found guilty of improper

driving practices may be effectively dealt with.

- b. Mandatory and meaningful driver education.
- c. Establishment and maintenance of adequate police forces to patrol highways and apprehend violators.
- d. Implied consent laws.
- e. Periodic vehicle inspection.

## DISCUSSION

In the discussions and writings of those who propose no-fault automobile accident reparation systems little if any mention is made of improved highway safety. Those who propose such plans seem to consider the highway accident as an inevitable occurrence.<sup>1</sup> There is no question that a reduction in the number of highway accidents would go a long way toward curing many of the problems, such as the cost of auto insurance and the impact of auto cases on court work loads, which are held out as reasons why the present system should be eliminated.<sup>2</sup> We are concerned with highway safety and are convinced that meaningful programs to prevent highway accidents would have worthwhile results.

There are those who claim that a shift to a no-fault auto accident reparations system would have no effect on highway safety.<sup>3</sup> We believe that this is a subject so important that decisions regarding it should not be made on speculation and conjecture. For this reason DRI and other concerned defense lawyer groups funded a research project to study this question. Lawrence Lawton, a professional engineer and traffic consultant directed the research. The research is nearing completion and a preliminary report, *Psychological Aspects Of The Fault System As Compared*

<sup>1</sup>See, e.g., Keeton & O'Connell, BASIC PROTECTION FOR THE TRAFFIC VICTIM 11-13 (1965)

<sup>2</sup>"Any responsible student of the problem must acknowledge that there will be no sizable reduction in automobile insurance costs until the traffic safety record improves and until the rate of national inflation decelerates." Address by James S. Kemper, Jr., American Mutual Insurance Alliance Annual Meeting, May 26, 1969

<sup>3</sup>Insurance Leaders Says Plan Eliminates Two Auto 'Hang-Ups,' Insurance Information Institute (News Release Dec. 11, 1968)

*With The Non-Fault System Of Automobile Insurance*, has been completed. Based upon the initial research, this preliminary report concludes that the adoption of a no-fault automobile accident reparation system and the abolition of fault in determining civil liability will result in an increase in the frequency of automobile accidents. The operation of the present fault system was found to provide a meaningful deterrent to improper motor vehicle operating practices. DRI will make the results of this research available to those who are interested in this subject. In addition, meaningful research which seeks to further examine this problem will be supported.

Much could be done to improve highway safety if greater concentration were placed on the motorist as the cause of accidents. Studies have shown the high involvement of alcohol and drug use as a cause of traffic accidents.<sup>4</sup> It has also been shown that traffic deaths and injuries could be reduced by a substantial percentage if only the small number of habitual traffic law violators were taken off of the road.<sup>5</sup> We believe that driving is a privilege and not a right. We have set forth certain proposals to deal with the accident producers and will support all meaningful legislation to protect the careful motorist from those who abuse their driving privilege.

Studies have shown that many drivers do not have the mental or physical capacity to operate high-powered vehicles on modern, congested highways.<sup>6</sup> In addition, many of the vehicles which are operated on our highways are allowed to fall into

a state of disrepair which makes them a menace to others.<sup>7</sup> Just as pilots and aircraft are given periodic inspection to insure air safety, motorists and vehicles should be inspected to improve highway safety.

Automobile safety devices such as safety belts and motorcycle safety helmets have been shown to be extremely effective in the prevention of injury and death on our roads.<sup>8</sup> We have proposed and will support measures to require the installation and use of such devices.

Finally, we will support measures which make the work of those persons charged with the enforcement of our traffic laws more effective.

The proposals that have been made and will be supported are not claimed to be the ultimate solution which will prevent all highway accidents. Much more can be done and is being done. There is also the need to improve the highways and vehicles which we use. Others are working in those areas and they also need support. We will, for the present, concentrate our traffic safety efforts on the driver. We believe that this is an area in which we can be most effective and is an area which has been given too little attention.

## LEGISLATION

### MANDATORY LICENSE REVOCATION FOR OPERATION WHILE UNDER INFLUENCE OF DRUGS

**Operating Under Influence Of Drugs.** (1) It shall be unlawful for any person to operate a motor vehicle upon the public highways of this state while under the influence of drugs.

(2) For the purposes of this statute, drugs shall include alcohol, barbituates, stimulants or any other chemical, organic or inorganic, as classified by the National Pharmaceutical Manual as being capable of producing intoxication.

(3) Upon conviction, the defendant may be sentenced to a term in the county jail not to exceed one year, or fined in an amount not to exceed \$1000, or both. In every such case, the Court shall order the driver's license revoked for the period of one (1) year and shall forthwith demand the driver's license, which shall be delivered to the Court before the defendant is released from custody. The license, together with a record of the conviction, shall be transmitted to the Department of Motor Vehicles, and the defendant may, upon expiration of one year, make application for re-

<sup>4</sup>"The use of alcohol by drivers and pedestrians leads to some 25,000 deaths and a total of at least 800,000 crashes in the United States each year." *Alcohol and Highway Safety - A Report to Congress from the Secretary of Transportation*, Dep't of Transp. (August 1968). It should be noted that tougher control of drinking drivers in the United Kingdom significantly reduced the accident rate in that country when new laws were properly enforced. *The Road Safety Act 1967 and Its Effect on Road Accidents in the United Kingdom*, 17 *Traffic Digest & Rev* 3 (No 8, Aug 1969).

<sup>5</sup>Barnes, *Portrait of a Bad Driver*, *Best's Ins News* at 16 (Aug 1965); Campbell, *The Effect of Driver Improvement Actions on Driving Behavior*, 3 *Traffic Safety Research Rev* 3 (1959).

<sup>6</sup>Proceedings, National Conference on Medical Aspects of Driver Safety and Driver Licensing (Nov 1964); West, Nielsen, Gilmore & Ryan, *Natural Death at the Wheel*, 205 *JAMA* 266 (July 1968); Smith, *When Your Patient Shouldn't Drive*, *Medical Economics* at 110 (Oct 28, 1968).

<sup>7</sup>*Safety for Motor Vehicles in Use - A Report to the Congress from the Secretary of Transportation*, Dep't of Transp. (June 1968).

<sup>8</sup>Kircher, *The Seat Belt Defense* 7 (DRI monograph Sept 1967); *Motorcycles in the U. S.*, Dep't of Health, Education & Welfare (1967).

instatement of his driver's license pursuant to such rules and regulations as shall be promulgated by the Department.

(4) If the defendant has been previously convicted for the above offense within a period of sixty (60) calendar months, the Court shall sentence him to a term in the county jail, of not less than six months or more than one year.

#### PERMANENT REVOCATION OF DRIVING PRIVILEGE FOR REPEATED OFFENSES

**Permanent Revocation Of Driving Privilege.** (1) It shall be the duty of every traffic court in this state, whether civil or criminal, to keep a record of the convictions of each person who appears before them, stating the date, the charge and the result of the trial. Said information shall be transmitted to the Department of Motor Vehicles once each month, and said court records shall be retained by said court for a period of five years, and shall then be destroyed one year at a time, so that said records reflect the period five years prior to the date such records are destroyed.

(2) If the defendant shall have been previously convicted for traffic offenses under Sections \_\_\_\_\_ of the statutes or motor vehicle regulations of this state, [where such offenses involve injury to persons or property, or the threat of such injuries, or the repeated operation of a motor vehicle while under the influence of drugs,]<sup>9</sup> upon conviction for the fifth such offense, within a period of five years or sixty calendar months, the defendant shall be ordered permanently deprived of his driver's license and his standing to obtain vehicular license plates.

(3) Nothing in the foregoing statute shall apply so as to prohibit a person who owns, rents or operates more than one motor vehicle from obtaining license plates for all such vehicles, if used in the production of income and not solely for personal convenience, and if such vehicles are to be operated at all times by others.

#### PENALTIES FOR PEDESTRIANS WHO CAUSE MOTOR VEHICLE ACCIDENTS

**Pedestrians Causing Accidents.** (1) Any pedestrian who shall be found legally at fault, in whole or in part, for the death, personal injury or property damage of another arising out of a motor vehicle accident on the public highways of this state, if such liability is founded upon said person's use of drugs and the conduct shall have been the product of intoxication by reason of the use of said drugs, shall be guilty of a misdemeanor and may be sentenced to a term in the county jail not to exceed one year, or a fine not to exceed \$1000, or both.

(2) For the purposes of the above statute, the term drugs shall include any substance taken orally, intravenously, or by any other means, which significantly impairs the physical or mental capacities of said pedestrian, whether or not such drugs are taken under medical orders. Drugs shall include alcohol, barbituates, stimulants or any other chemical, organic or inorganic, as classified by the National Pharmaceutical Manual as being capable of producing intoxication.

<sup>9</sup>The material in brackets may be eliminated if statutes in a particular state are specific enough to cover the listed areas.

#### UNIFORM LICENSING STANDARDS FOR ALL MOTOR VEHICLE OPERATORS

**Operators License Standards.** (1) No person shall operate a motor vehicle upon the public highways of this state unless he shall have in his possession a valid operator's license, issued by the Department of Motor Vehicles of the State of \_\_\_\_\_, as provided herein.

- (a) No person under the age of 16 years shall be eligible for a permanent driver's license.
- (b) No person who has been adjudged incompetent, by a judicial finding, shall be eligible for a driver's license.
- (c) No person who is addicted to the use of drugs, or who has been found guilty of a traffic offense under Section \_\_\_\_\_, five or more times within a period of 5 years or 60 calendar months, shall be eligible for a driver's license.
- (d) No person who cannot read and write the English language may operate a motor vehicle within this state, whether in possession of a valid foreign driver's license or not.
- (e) Every other person who shall apply for a driver's license within this state, shall first be required to pass a written examination demonstrating a sufficient understanding of the laws and motor vehicle regulations necessary to properly operate a motor vehicle, as the Department of Motor Vehicles shall require, of the class and kind for which the application is made.
- (f) Every applicant for a driver's license shall be required to pass a visual examination as established by the Department, which shall insure a visual capacity, with or without glasses, of 20/40 in each eye, and adequate depth and peripheral vision to operate a motor vehicle of the class and kind for which the application is made.
- (g) If the applicant for a driver's license shall indicate in his application, any disease, whether physical or mental, or any impairment of organs, body or limbs which would significantly affect his capacity to drive a motor vehicle of the class and kind for which the application is made, the Department may require him to submit to a physical or mental examination or both, as shall be established by the Medical Advisory Board of the Department of Motor Vehicles. No license or temporary permit shall be issued until such examination has been filed with the Department.
- (h) Every person who is, or shall become licensed to operate a motor vehicle under the laws of this state, shall be examined pursuant to the above provisions, including a suitable demonstration test of his driving ability, once every four (4) years. If the applicant for renewal of his license has been involved in a motor vehicle accident under Section \_\_\_\_\_, or shall indicate in his application for renewal of his license any serious illness or physical or mental impairment prior to said renewal, he shall be re-examined even though four years shall not have expired since his last examination.
- (i) Any person who is the holder of a valid driver's license, and who has become incapable of operating a motor vehicle of the

class and kind for which said license is issued, may be required by the Department to submit to re-examination upon the request of any citizen and at least one member of his immediate family, or if without relatives, some member of the sheriff's office, city police or judiciary. Such request shall be made to the Director of the Department of Motor Vehicles, by affidavit, duly verified and made upon the personal knowledge of the affiant, setting forth the facts upon which such request is made and filed with the Department. Such a request shall not subject the affiants to civil or criminal liability by the holder of said license or anyone acting by or through him.

- (j) Any person who is the holder of a valid driver's license who is between the ages of 16 years and 25 years, and who is involved in a significant number of moving traffic violations (not less than six) during any 12 month period, may be re-examined at the direction of Department, and shall be placed on probationary status for a period of 12 months pursuant to such rules and regulations as shall be promulgated by the Department.
- (k) Any person licensed under the law of any other state or foreign country shall be eligible to operate a motor vehicle in this state, if he has a valid operator or driver's license from such other jurisdiction, for a term not to exceed thirty (30) days.

#### MANDATORY INSTALLATION, MAINTENANCE AND USE OF SAFETY EQUIPMENT

**Safety Equipment.** (1) It shall be unlawful for any person to own or operate or to allow another to operate his motor vehicle, upon the public highways of this state, unless all safety equipment or devices attached thereto, or constituting a part of

the mechanical operational system of said motor vehicle, or to be worn or used on the person of said owner, operator or passengers, as required by state law, are properly installed, maintained and in good working condition, at any time said motor vehicle is in motion, or is in use upon said public highways.

(2) Safety belts shall be provided in the seats of all motor vehicles having four wheels or more, for the maximum number of passengers who can occupy said seats. Evidence of the non-use of safety belts or safety helmets while riding on a motorcycle, by either the operator, owner or passengers in said motor vehicle shall be admissible in the trial of any action for death, personal injury or property damage arising out of the use of said motor vehicle, if such non-use is relevant to the cause of the accident or the death, personal injuries or property damage incurred by the parties to the litigation.

(3) Public passenger carriers, including but not exclusive of taxicabs, buses, school buses and railroad passenger cars, which are used for the transportation of passengers and which obtain a maximum speed of forty (40) miles or more, and which are primarily used to transport persons a distance of more than one (1) mile between stops, shall have similar safety belts attached to each seat.

(4) Failure on the part of the owner or operator to install or maintain in said motor vehicles, such safety equipment, shall be punishable, upon conviction, as a misdemeanor, and the court may sentence said person(s) to a term in the county jail not to exceed one (1) year, or a fine not to exceed \$1000, or both.

(5) Evidence of nonuse of safety equipment by the owner, operator or passengers in all motor vehicles shall be prima facie proof of negligence of said owner, operator or passengers in any action for damages based on the death, personal injuries or property damage sustained by said owner, operator or passenger.

## First Party Coverage

### PROPOSAL

That every automobile liability policy covering any private passenger vehicle, on a non-fleet basis, provide minimum stated coverages for medical and hospital expenses, uninsured motorist protection, income disability and accidental death benefits for the named insured and members of the family of the named insured residing in his household. That the policy provide the same coverages to guest passengers injured while occupying the insured motor vehicle who are not afforded such protection by sources collateral to the insured's policy. The named insured will have the right to reject this coverage as it applies to himself and members of his family residing in his household. Questions as to whether subrogation, setoff against liability coverage, excess or "other insurance" provisions will be part of the coverage should be left to the discretion of insurers.

### DISCUSSION

It is claimed that a problem exists with relation to the number of persons who are injured in motor vehicle accidents and receive no compensation for the economic loss that they suffer.<sup>10</sup> When an analysis is made of the great percentage of the population that is protected against such loss by forms of non-auto, first party insurance,<sup>11</sup> and the number of persons covered by automobile medical payments<sup>12</sup> and uninsured motorist coverage<sup>13</sup> is also taken

into consideration, there is serious doubt as to whether the problem is as great as is claimed.

Many of the recent automobile accident reparations plans that have been proposed, notably the Keeton-O'Connell,<sup>14</sup> American Insurance Association (AIA)<sup>15</sup> and Cotter proposals,<sup>16</sup> seek to solve this problem, to whatever extent it actually exists, by forcing all motorists to purchase minimum first party coverage. Under such plans the purchase of this coverage is a condition precedent to being allowed to drive in a state enacting the plan. However, no provision is made under such plans for the motorist who has adequately protected himself and his family against such losses through other sources of indemnity. There is no way for him to avoid purchasing unneeded coverage. He is forced to pay another premium for it. The plight of this "overinsured motorist" is further complicated under some plans (Keeton-O'Connell<sup>17</sup> and versions of the AIA plan proposed in Minnesota<sup>18</sup> and Connecticut<sup>19</sup>) which provide for a collateral source set-off. With a setoff the motorist who sustained medical and hospital expenses as the result of an auto accident would not be able to recover those expenses under his "no-fault" auto insurance if, for example, they had been paid by his medical and hospital insurance policy. While the propriety of the Collateral Source Rule is debated in a third party liability situation,<sup>20</sup> it is grossly unfair to force a person to pay for first party insurance under which he will not be able to recover benefits. Such persons will, in effect, subsidize the system for those who do not carry multiple coverages. Even without a collateral source setoff, it is inconsistent for

<sup>10</sup>Keeton & O'Connell, note 1 *supra* at 1

<sup>11</sup>Statistics for the year 1966 show that over 81% of the population was covered by private health insurance as compared to 50% in 1950. STATISTICAL ABSTRACT OF THE UNITED STATES at 466 (1968 ed)

<sup>12</sup>It has been estimated that over 80% of those insureds who purchase automobile liability insurance have voluntarily purchased medical payments coverage. Address by Andre Maisonnier, Independent Mutual Insurance Agents of New York meeting Sept, 1968

<sup>13</sup>Forty-six states have enacted statutes requiring insurers to offer uninsured motorist coverage. In eleven states, the coverage is mandatory, and in the remainder the insureds have the right to reject the coverage. Graham, *Recent Interpretations of the Uninsured Motorist Endorsement*, 4 The Forum 160 (Apr 1969)

<sup>14</sup>Keeton & O'Connell, note 1 *supra* at 343

<sup>16</sup>House Bill 7109, Conn Gen Assembly (Jan Sess 1969)

<sup>17</sup>Keeton & O'Connell, note 1 *supra* at 401

<sup>18</sup>Senate Bill 753, Minn (1969)

<sup>19</sup>Senate Bill 731, Conn Gen Assembly (Jan Sess 1969)

<sup>20</sup>See page 21 *infra*

plans which are offered for the stated purpose of reducing the cost of insurance to force persons to buy protection they do not need.

We propose to give each insured the option to determine for himself whether the coverage offered is needed for his own protection and that of his family. He would not be forced to pay an additional premium for unneeded coverage. It should be noted that the proposal does not give the insured the right to reject the coverage available for the protection of guest passengers who are not otherwise covered. The purpose is to provide only necessary coverage and not overprotection.

No attempt has been made to spell out every detail of the proposed coverage. Whether subrogation or setoffs against liability coverage will be provided, whether provision will be made to allow for excess coverage or to provide "other insurance" exclusions, should be matters for insurers to determine at the local level. It would be folly to attempt to spell out these details or the dollar limits which should be offered on each type of coverage. What might be adequate or acceptable coverage in one area of the country may be inadequate or unacceptable in another due to variances in applicable rules of law, physicians' charges, hospital room rates, average wages and the like. We propose that certain coverages be offered for definite, stated minimum amounts and that the insured have the right to increase the coverages in given multiples at additional premiums. What we seek is to provide coverage at as low a cost as possible for those who really need it.

## LEGISLATION

### MINIMUM FIRST PARTY COVERAGES IN AUTOMOBILE POLICIES

**Required First Party Coverages.** (1) Every automobile liability policy covering any private passenger motor vehicle issued or delivered in this state on a non-fleet basis shall provide minimum medical and hospital benefits, uninsured motorist coverage, income disability and accidental death benefits under policy provisions approved by the Commissioner of Insurance to the named insured and members of his family residing in the same household injured in a motor vehicle accident and to guest passengers injured while occupying the insured motor vehicle as follows:

- (a) *Medical And Hospital Benefits.* All reasonable and necessary expenses for medical, hospital, dental, surgical, ambulance and

prosthetic services incurred within \_\_\_\_\_ (months) (year) (years) after the automobile accident up to an aggregate of \$ \_\_\_\_\_. Expenses for hospital room charges may be limited to semi-private accommodations.

- (b) *Uninsured Motorist Coverage.* Coverage in the amount of at least \$ \_\_\_\_\_ per person and \$ \_\_\_\_\_ per accident for the protection of the insureds who are legally entitled to recover damages from owners or operators of uninsured motor vehicles because of bodily injury, sickness or disease, including death resulting therefrom, occurring as the result of a motor vehicle accident. For the purposes of this coverage the term "uninsured motor vehicles" shall include, but not be limited to, any motor vehicle with respect to which there is a bodily injury liability insurance policy applicable at the time of the accident but the company writing the same denies coverage thereunder or is or becomes insolvent.
- (c) *Income Disability Benefits.* \_\_\_\_\_% of the loss of income from work during a period commencing \_\_\_\_\_ days after the date of the accident and not to exceed \_\_\_\_\_ weeks, but subject to a maximum of \$ \_\_\_\_\_ per month. In the case of a non-wage earner, such benefits shall consist of expenses not to exceed \$ \_\_\_\_\_ per day which are reasonably incurred for essential services in lieu of those the injured person would have performed without income during a period commencing \_\_\_\_\_ days after the date of the accident and not to exceed \_\_\_\_\_ weeks.
- (d) *Accidental Death Benefits.* The sum of \$ \_\_\_\_\_ to be paid to the personal representative of the insured should injury, sickness or disease resulting from an automobile accident result in death within \_\_\_\_\_ (days) (weeks) of the accident causing the same.

(2) The named insured shall have the right to reject the coverages enumerated in section (1) as they apply to himself and members of his family residing in his household. Unless the named insured requests such coverage in writing, such coverage need not be provided in or supplemental to a renewal policy when the named insured has rejected the coverage in connection with a policy previously issued by the same insurer.

(3) The policy shall provide that the coverages enumerated under section (1) are not applicable to a guest passenger, other than a member of the family of the named insured residing in his household, injured while occupying the insured vehicle if similar coverages are afforded to said guest passenger either as a named insured or additional insured under the provisions of another valid automobile insurance policy.

(4) The amount an insurer is obligated to pay any insured under the provisions of subsection (1) (b) of this statute shall be reduced by the amount of benefits paid to said insured or his personal representative under the provisions of subsections (1) (a), (c) and (d).

(5) An insurer may exclude benefits to any insured or his personal representative when the insured's conduct contributed to the injury he sustained in any of the following ways:

- (a) causing injury to himself intentionally;
  - (b) operating a motor vehicle while under the influence of intoxicating liquor or narcotic drugs;
  - (c) using a motor vehicle without the authority of its owner, knowing that such use is unauthorized;
  - (d) operating a motor vehicle without a license or after suspension or revocation of his license;
  - (e) operating a motor vehicle in any race or speed contest;
  - (f) seeking to elude lawful apprehension or arrest by a law enforcement official.
- (6) Insurers affording the coverages enumerated in section (1) may provide for subrogation and also for setoffs of amounts paid under that section against claims brought under the liability section of the policy through appropriate policy language approved by the Commissioner of Insurance.
- (7) Nothing contained in this statute shall be construed as preventing an insurer from providing broader benefits than the minimum benefits enumerated in section (1).

## Court Congestion And Delay

### PROPOSALS

1. That through appropriate legislative action a means be established to provide a sufficient number of judges to keep abreast of the increase in judicial work occasioned by population growth.
2. That the mandatory arbitration of all lawsuits which involve claims under \$3000 be employed in jurisdictions troubled with court delay.

### DISCUSSION

There are those who portray delay in the courts in such a light as to make it appear that every litigant in every jurisdiction must wait many years to have his case brought to trial.<sup>21</sup> There are also those who trace the problem of court delay to the automobile accident case and seem to assert that delay would disappear if this type of litigation were removed from courts.<sup>22</sup>

The problem of court delay, its apparent causes and probable cures were set forth in a special report, JUSTICE IN COURT AFTER THE ACCIDENT, issued by DRI, the International Association of Insurance Counsel, the Federation of Insurance Counsel and the Association of Insurance Attorneys in January, 1968.

Initially, DRI conducted two surveys to determine whether court delay was as widespread as was claimed.<sup>23</sup> These surveys demonstrated that court congestion and delay is a problem limited to a small number of metropolitan jurisdictions. State courts in only six cities in four states have delay of over three years between certification of readiness for trial by opposing attorneys and the commencement of the trial. Federal courts were found to be in even better condition. Other studies have shown that the automobile accident case takes up only a small percentage of judicial time and that the major culprit in jurisdictions having delay is the growth

of crime and resultant criminal actions in the courts.<sup>24</sup>

Another DRI survey is in progress to determine causes of congestion in pertinent cities. State and federal courts in cities which are known to have delay in excess of twelve months between the time attorneys certify readiness and actual commencement of trial are being measured. This study will recheck the accuracy of delay figures, the percentage of personal injury lawsuits arising from automobile accidents which are found in court backlog and the size of these lawsuits. Also sought will be the number of judges devoting their time to this type of trial (compared to other trials), how the time of judges who perform multiple duties is allocated, and when the number of judges was last increased for the court system. A second portion of the survey will follow and will examine closely court and trial procedures in congested cities. Other problems which will be studied include an examination of the states' facilities and court personnel, the availability of trial attorneys, and practices relating to *ad damnum*, contingent fee abuse and settlement procedures.

From the studies which have been conducted to date, certain conclusions can be drawn. While delay does not exist in every court and affect every litigant, it is a great problem in many metropolitan jurisdictions which handle litigation involving a considerable percentage of the nation's population and, to that extent, can be considered a serious problem. Removing automobile accident cases from the courts will not solve the problem of delay where it does exist. If these cases were removed and nothing more were done, any relief in the judicial workload would be temporary since the continued growth in population would produce more cases of other varieties to burden existing judicial manpower. If corrective measures are not taken, court delay will increase in urban areas so that an even larger segment of our population will be adversely affected. Courts and judicial personnel must

<sup>21</sup>See, e.g., O'Connell, *The Road Ahead: For Automobile Insurance*, 1 Conn L Rev 22, 23 (1968)

<sup>22</sup>*Ibid*

<sup>23</sup>Ross, *DRI Studies Refute Court Delay Claims of Critics*, 36 Ins Counsel J 46 (Jan 1969)

<sup>24</sup>*Id* at 48-9

be increased to meet population growth just as utilities and others offering services to the public expand their facilities to meet new demands. What is proposed is that legislative procedures be employed to provide a means through which the judiciary will be increased in size to keep pace of population growth. This approach has proved successful where it has been employed.

In addition to increasing judicial manpower, another means can be employed to provide for the equitable disposition of lawsuits and the relief of overburdened courts. In Philadelphia a system of mandatory arbitration of all lawsuits involving claims under \$3,000 has been successfully employed.<sup>25</sup> This procedure employs a panel of attorneys, skilled in the law, to hear such actions. The litigants' right to a trial by jury is preserved since a trial *de novo* is provided should any of the parties disagree with the judgment of the arbiters. Those who have had experience with the Philadelphia arbitration plan have found that it has successfully reduced the delay in the courts, has proved to be a less expensive procedure to the litigants, and has resulted in the equitable disposition of smaller cases. Arbitration patterned after the Philadelphia plan is recommended for all jurisdictions that are troubled with court delay.

## LEGISLATION

### CREATION OF NEW JUDGESHIPS BASED UPON POPULATION

**New Judges.** The legislature shall provide for one ..... judge in each ..... for each fifty thousand inhabitants or major fraction thereof according to the last census authorized by law.<sup>26</sup>

### MANDATORY ARBITRATION OF CERTAIN LAWSUITS<sup>27</sup>

**Submission To Board Of Members Of Bar.** (1) The several courts may, by rules of court, provide that all cases which are at issue where the amount in controversy shall be three thousand dollars (\$3000) or less, except those involving title to real estate, shall first be submitted to and heard by a board of three (3) members of the bar within the judi-

cial district. Cases which are not at issue and whether or not suit has been filed may be referred to the board of arbitration by agreement of reference signed by counsel for both sides in the case. Said agreement of reference shall define the issues involved for determination by the board and, when agreeable, shall also contain stipulations with respect to facts submitted or agreed or defenses waived. In such cases, the agreement of reference shall take the place of the pleadings in the case and be filed of record.

(2) **Manner Of Choosing Arbitrators.** (a) In all cases a board of arbitrators consisting of three members of the bar within the judicial district shall be appointed by the clerk of court from the list of attorneys qualified to act. The names of attorneys from said list shall be taken in the manner prescribed by the rules of the court in which the case is pending or in the absence of such rules in alphabetical order, except where attorneys are excused on account of incapacity or illness. Not more than one member of a firm or association of attorneys shall be appointed to the same board; provided, that the parties may agree to refer the cause to any one person whom they shall concur in choosing; the first person named to said Board of Arbitrators shall be Chairman of the Board.

(b) The Board of three (3) members of the bar shall be appointed ten (10) days after the case is at issue or after filing of the agreement of reference, upon written notice filed by counsel for either party with notice to the opposing counsel. Where no appearance has been entered the Board shall be appointed on written notice of plaintiff's counsel to hear the case and pass on the question of damages. The Board shall make its report and render its award within twenty (20) days after the hearing.

(c) A certified copy of the record containing the names of the arbitrators and the time and place of meeting shall be served upon the opposite party, his agent or attorney; but if said party has no agent or attorney, then it shall be lawful to serve said certified copy upon the opposite party in the same manner as a writ of summons in a personal action is now served: Provided, that a certified copy of the record, containing the names of the arbitrators and the time and place of meeting for selection of the Board shall be served at least ten (10) days before the time of meeting. No arbitrator shall be compelled to serve on more than ..... appointments in any one year.

(3) **Arbitrators To Be Sworn.** When the whole number of the arbitrators shall be assembled, they shall be sworn or affirmed, justly and equitably to try all matters in variance submitted to them, which oath or affirmation may be administered to them by the clerk of court or any person having authority to administer oaths, or in the absence of such person, by one of their number.

(4) **Postponement Of Meeting.** In every case in which application shall be made by either party to the arbitrators, for the postponement of a hearing, it shall be lawful for the said arbitrators, or a majority of them, if satisfied of its justice,

<sup>25</sup>Ryan, *Arbitration Cuts Philadelphia Backlog*, 10 For The Defense 42 (June 1969)

<sup>26</sup>This provision is modeled after Article 5, Section 6, of the Florida Constitution.

<sup>27</sup>Sample statutes and supporting research on mandatory arbitration are available from the DRI Milwaukee office.

according to the practice of the courts in like cases, to postpone such hearing.

(5) *Transmission Of Award.* As soon as the arbitrators shall have heard the evidence and allegations of the parties, they shall proceed to determine the matters in controversy, submitted to them, and they shall make out their award, which shall be signed by all, or a majority of them, and shall transmit the same to the clerk of court, within seven (7) days after they shall have agreed upon the same.

(6) *Award To Be Entered Of Record.* It shall be the duty of the clerk of court receiving such award forthwith to enter the same, of record, in the proper judgment docket.

(7) *Award To Have Effect Of Judgment.* Every award so entered shall have the same force and effect of a judgment entered by the court.

(8) *Award May Be Set Aside.* It shall be lawful for the several courts of \_\_\_\_\_ to set aside an award of arbitrators, on due proof:

- (a) That the arbitrators shall have been guilty of willful misconduct in the course of the hearings before them;
- (b) That the award was procured by corruption, or other undue means.

(9) *Proceedings On Award When Transferred.* After judgment the plaintiff may proceed upon said transferred record and judgment for the collection thereof, with costs, by execution, bill of discovery or attachment, in like manner as if the same were a judgment of the court to which it has been transferred.

(10) *Appeal.* Either party may appeal from an award of arbitrators, to the trial court in which the cause was pending at the time the rule or agreement of reference was entered, under the following rules, regulations and restrictions:

- (a) The party appellant, his agent, or attorney, shall make oath or affirmation, that "it is not for the purpose of delay such appeal is entered, but because he firmly believes injustice has been done;"
- (b) Such party, his agent or attorney, shall pay all the costs that may have accrued in such suit or action;
- (c) The party, his agent, or attorney, shall enter into the recognizance hereinafter mentioned;
- (d) Such appeal shall be entered, the cost paid, and the recognizance filed, within twenty (20) days after the day of the entry of the award of the arbitrators on the docket;
- (e) Any party appealing shall first repay to the county the fees of the members of the Board of arbitrators herein provided for, but not exceeding fifty percent of the amount in controversy. The balance of the arbitrator's fees shall be absorbed and paid by the county. Such fees shall not be taxed as costs or be recoverable in any proceeding. All appeals shall be de novo both on the law and the facts.

(11) *Indigent Appellant.* If the party against whom any award shall be made as aforesaid, not being the party by whom the rule of reference was taken out, shall apply by petition, to a judge of the court in which such action is commenced, and shall therein set forth that, by reason of poverty, he is unable to pay the costs of the suit, as aforesaid, and shall make affidavit of such facts,

it shall be lawful for such judge, after due notice to the opposite party, if he shall be satisfied of the truth of the statements in such petition, to make an order, that the appeal of such party in the case, shall be good, although the costs shall not be paid by him, as aforesaid.

(12) *Recognizance On Appeal.* The appellant shall by himself, his agent or attorney, with one or more sufficient sureties, be bound in recognizance to the adverse party the condition of which shall be, that if he shall not, in the event of the suit, recover a sum greater, or a judgment more favorable to him than the award of the arbitrators, he shall pay all costs that shall accrue in consequence of said appeal, and \_\_\_\_\_ dollars for every day lost by the adverse party in attending on such appeal.

(13) *Appeal By Minor Or One Who Sues In Representative Character.* In all cases in which executors, administrators or other persons suing or sued in a representative character, or minors, shall be the party appellant from an award, the appeal shall be good, without payment of costs, or entering in cognizance, as aforesaid, if such appellant shall not have been the plaintiff in such cause.

(14) *Recovery Of Appeal Costs.* The costs to be paid by the appellant, as herein required, may nevertheless, be taxed in the appellant's bill, and recovered of the adverse party, if, in the event of the suit, the appellant is entitled to recover costs, agreeably to the provisions of this act: Provided, that the compensation of the arbitrators repaid to the county by appellant as provided by this act, shall not be taxed as costs or recovered from the adverse party.

(15) *Exception To Pre-payment Of Accrued Costs On Appeal.* Section 10 of this statute shall be so construed as to require the payment by the appellant, to the clerk of court, of all costs which have previously accrued, whenever an appeal is entered from an award of arbitrators, excepting where executors, administrators, guardians or trustees are appellants.

(16) *Powers Of Arbitrators.* Arbitrators in every case, as aforesaid, or a majority of them, shall have power:

- (a) To require from either party the production of all such books, papers and documents as they shall deem material to the cause;
- (b) To judge of the competency and credibility of witnesses, and the propriety of admitting any written evidence that may be offered;
- (c) To administer oaths or affirmations to witnesses;
- (d) To adjourn their meetings from day to day, or for a longer time, and also from place to place, if they shall think proper;
- (e) To decide both the law and fact that may be involved in the cause submitted to them;
- (f) The arbitrators shall not be required to make a record of the proceedings before them. If any party shall desire a record, the arbitrators shall provide a reporter and cause a record to be made and the party requesting the same shall pay the cost thereof;
- (g) Each of the arbitrators shall have power to issue subpoenas to witnesses, to appear before them, and if any person who shall have been duly subpoenaed to attend as aforesaid, shall neglect or refuse to attend, a majority of the arbitrators shall have power to issue

an attachment against such person, according to the practice of the courts;

- (h) Arbitrators, or a majority of them, shall also have power to punish, by fine, not exceeding ..... dollars, all persons, whether parties, witnesses or others, who shall be guilty of disorderly conduct in their presence, or who shall insult, disturb or interrupt the said arbitrators, when in session.

(17) *Clerk Of Court May Subpoena Witnesses.* The clerk of court in which the suit shall be pending shall have power to issue subpoenas for witnesses to appear before the arbitrators.

(18) *Compensation Of Arbitrators.* Every arbitrator, shall be entitled to receive the sum of ..... dollars for every day necessarily employed by him in the hearing and determination of the cause submitted to him. The compensation of each member of the Board of arbitrators shall be determined by the court and paid by the county for each case heard upon the filing of the report

and award, if any. Such fees shall not be taxed as costs nor follow the award as other costs.

(19) *Books, Papers Or Documents Withheld.* On the trial of any cause, after an appeal from an award of arbitrators, it shall not be lawful for the appellant to produce as evidence in court, any books, papers or documents, which he had in his power to produce at the time of the arbitration, and withheld from the arbitrators, after being required by the arbitrators to produce the same.

(20) *Depositions.* It shall be the duty of the clerk of court of the proper court, on application by either party, his agent or attorney, to enter a rule, to take the depositions of aged or infirm witnesses, witnesses unable to attend the hearing for good cause, or witnesses out of the state, to be read in evidence, either before the arbitrators, or to the jury, in case of an appeal from an award of arbitrators in the same manner, and subject to the same rules and regulations, as are now observed in the courts of this state.

# Contingent Fee Regulation

## PROPOSAL

The following five-point program is proposed for the regulation of the contingent fee system:

1. The amount of any contingent fee should be strictly regulated by appropriate local court rule or legislation.
2. Every retainer on a contingent basis should be in writing in a fixed format and should be signed by the client.
3. A retainer statement should be filed with the appropriate judicial authority by a retained attorney within a fixed number of days from the date of the written contingent fee retainer.
4. There should be strict control of the division of fees between attorneys, based only upon work performed.
5. Upon completion of the claim or suit an attorney should file an itemized closing statement with the proper judicial authority and a copy thereof must be delivered to the client.

## DISCUSSION

It has been said, and rightly so, that the contingent fee system provides the means through which a man of modest means may gain legal representation by a highly skilled and competent trial counsel. However, there are those who attack the system and claim that it is unfair for a portion of one's legal recovery to be shared with the lawyer who represented him. It must be remembered that the legal system in America is such that the successful litigant does not receive actual legal expenses as part of the damages he recovers. Legal "costs" are recovered, but these are small in comparison to the actual costs incurred in the prosecution or defense of a lawsuit. Therefore, even in those cases in which a contingent fee is not employed, the successful litigant's recovery is diminished by the fee that is paid for legal representation.

At present, no workable approach has been fashioned to allow the taxing of actual legal expenses as an item cost to be recovered by the successful litigant. Until one is, the contingent fee system provides the only means by which a person who is financially unable to retain counsel on

some other basis may have his day in court.

Although the contingent fee system has proved to be beneficial, it is subject to misunderstanding and abuse.<sup>28</sup> Those who abuse it are small in number, yet they bring the entire profession, and especially those who are conscientious in the use of the system into disrepute. Further, its abuse reduces the amount of net recovery by the injured party. By eliminating abuse, the take home award of the injured party will be increased and the "cost" of the tort system reduced proportionately.<sup>29</sup>

The proposal seeks to eliminate the abuse by placing the control of the size of the contingent fee and the supervision of its use with proper legislative or judicial authority. It also seeks to correct some of the misunderstanding about the operation of the system by requiring fee agreements and closing statements to be in writing and by requiring the client to sign the agreement and be given a copy of the closing statement.

## LEGISLATION

### REGULATION OF CONTINGENT FEES<sup>30</sup>

**Contingent Fees.** (1) *Retainer Statement Required.* Every attorney who, in connection with any action or claim for damages for personal injuries or for property damages or for death or loss of services resulting from personal injuries accepts a retainer or enters into an agreement, express or implied, for compensation for services rendered or to be rendered in such action, claim or proceedings, whereby his compensation is to be dependent or contingent in whole or in part upon the successful prosecution or settlement thereof, shall within thirty days from the date of any such retainer or agreement of compensation, sign personally and file with the \_\_\_\_\_ a written statement of such retainer or agreement of compensation, containing the information hereinafter set forth. Such statement may be filed personally by the attorney or his representative at the \_\_\_\_\_

<sup>28</sup>A Study of Contingent Fees in the Prosecution of Personal Injury Claims, 53 Ins Counsel J 197 (Apr 1966) [reprints available from the DRI Milwaukee office]

<sup>29</sup>A study conducted by the Concord Group Insurance Companies of 1968 automobile bodily injury claims revealed that claimants' attorney fees represented 21.8% of the "pure losses" paid and 12.9% of the premiums written.

<sup>30</sup>The sample statute and supporting research for the provision on contingent fee regulation is available from the DRI Milwaukee office.

\_\_\_\_\_ and upon such filing he shall receive a date stamped receipt containing the code number assigned to the original so filed. Such statement may also be filed by ordinary mail only, addressed to:

Statements filed by mail must be accompanied by a self-addressed stamped postal card containing the words "Retainer Statement," the date of the retainer and the name of the client. The \_\_\_\_\_

\_\_\_\_\_ will date stamp the postal card, make notation thereon of the code number assigned to the retainer statement and return such card to the attorney as a receipt for the filing of such statement. It shall be the duty of the attorney to make due inquiry if such receipt is not returned to him within ten days after his mailing of the retainer statement to the \_\_\_\_\_

(2) *Form Of The Retainer Statement.* A statement of retainer must be filed in connection with each action, claim or proceeding for which the attorney has been retained. Such statement shall be on one side of paper 8 1/4" x 14" and be in the following form and contain the following information:

#### Retainer Statement

To  
The State Of \_\_\_\_\_

1. Date of agreement as to retainer \_\_\_\_\_
2. Terms of compensation \_\_\_\_\_
3. Name and home address of client \_\_\_\_\_
4. If engaged by an attorney, name and office address of retaining attorney \_\_\_\_\_
5. If claim for personal injuries, wrongful death or property damage, date and place of occurrence \_\_\_\_\_
6. Name, address, occupation and relationship of person referring the client \_\_\_\_\_

Dated: \_\_\_\_\_, 19\_\_\_\_ day of \_\_\_\_\_, 19\_\_\_\_.

Yours, etc.

Signature of Attorney

Print or Type \_\_\_\_\_

Attorney \_\_\_\_\_

Office and P. O. Address  
Dept. \_\_\_\_\_ County. \_\_\_\_\_

Dist. \_\_\_\_\_

I hereby acknowledge receipt of a copy of the above retainer statement and certify that it constitutes a statement of my agreement and with the above stated attorney concerning the claim as set forth therein.

Client \_\_\_\_\_

(3) *Retainer Statements Of Co-Counsel.* An attorney retained by another attorney, on a contingent fee basis, as trial or appeal counsel or to assist in the preparation, investigation, adjustment or settlement of any such action, claim or proceeding shall, within fifteen days from the date of such retainer, sign personally and file with the \_\_\_\_\_ a written statement of such retainer in the manner and form as above set forth, which statement shall also contain par-

ticulars as to the fee arrangement, the type of services to be rendered in the matter, the code number assigned to the statement of retainer filed by the retaining attorney and the date when said statement of retainer was filed.

(4) *Retainer Statements Must Have Name Of Attorney Inserted.* No attorney shall accept or act under any written retainer or agreement of compensation in which the name of the attorney was left blank at the time of its execution by the client.

(5) *The Closing Statement.* A closing statement shall be filed in connection with every claim, action or proceeding in which a retainer statement is required, as follows: Every attorney upon receiving, retaining or sharing any sum in connection with a claim action or proceeding subject to this rule shall, within fifteen (15) days after such receipt, retention or sharing, sign personally and file with the \_\_\_\_\_ and deliver to the client, a closing statement as hereinafter provided. Where there has been a disposition of any claim, action or proceeding, or a retainer agreement is terminated, without recovery, a closing statement showing such fact shall be signed personally by the attorney and filed with the \_\_\_\_\_ within thirty (30) days after such disposition or termination. Such statement may be filed personally by the attorney or his representative at the \_\_\_\_\_ and upon such filing he shall receive a date stamped receipt. Such statement may also be filed by ordinary mail only, addressed to:

Statements filed by mail must be accompanied by a self-addressed stamped postal card containing the words "Closing Statement," the date the matter was completed, and the name of the client. The \_\_\_\_\_ will date stamp the postal card, make notations thereon of the code number assigned to the closing statement and return such card to the attorney as a receipt for the filing of such statement. It shall be the duty of the attorney to make due inquiry if such receipt is not returned to him within ten days after his mailing of the closing statement to the \_\_\_\_\_

(6) *Form Of The Closing Statement.* Each closing statement shall be on one side of paper 8 1/4" x 14" and be in the following form and contain the following information:

#### Closing Statement

To The  
The State Of \_\_\_\_\_

1. Code number appearing on Attorney's receipt for filing of retainer statement \_\_\_\_\_
2. Name and address of client \_\_\_\_\_
3. Plaintiffs: \_\_\_\_\_
4. Defendants: \_\_\_\_\_
5. If action commenced: \_\_\_\_\_ day of \_\_\_\_\_, 19\_\_\_\_, \_\_\_\_\_ Court, \_\_\_\_\_ County, File Number \_\_\_\_\_
6. Check items applicable: Settled ( ) ; Claim abandoned ( ) ; Judgment ( ) ; Date of payment \_\_\_\_\_ day of \_\_\_\_\_, 19\_\_\_\_.

7. Gross amount of recovery \$\_\_\_\_\_ of which \$\_\_\_\_\_ was taxable costs and disbursements.
8. Name and address of insurance carrier or person paying judgment of claim \_\_\_\_\_
9. Net amounts: to client \$\_\_\_\_\_; compensation to undersigned \$\_\_\_\_\_; names, addresses and amounts paid to attorneys participating in the contingent compensation \_\_\_\_\_
10. Compensation fixed by: retainer agreement { } ; under schedule ( ) ; or by court { } .
11. If compensation fixed by court:  
Name of Judge \_\_\_\_\_, Court \_\_\_\_\_  
Date of Order \_\_\_\_\_, Index No. \_\_\_\_\_
12. Itemized statement of liens, assignments, claims and expenses charged against client \_\_\_\_\_
13. Itemized statement of the amounts paid or agreed to be paid to others together with the name, address and reason for each payment \_\_\_\_\_
- Dated: \_\_\_\_\_, 19\_\_\_\_, \_\_\_\_\_ day of \_\_\_\_\_, \_\_\_\_\_
- Yours, etc.

Signature of Attorney  
Print or Type \_\_\_\_\_

Attorney \_\_\_\_\_

Office and P. O. Address \_\_\_\_\_

Dist. \_\_\_\_\_ Dept. \_\_\_\_\_  
County. \_\_\_\_\_

(7) *Signatures Required On The Closing Statement.* A joint closing statement may be served and filed in the event that more than one attorney receives, retains or shares in the contingent compensation in any claim, action or proceeding, in which event the statement shall be signed by each such attorney.

(8) *The Fee Schedule.* (a) Compensation which is equal to or less than the fees scheduled below is deemed to be fair and reasonable. The receipt, retention or sharing of compensation which is in excess of such scheduled fees shall constitute the exaction of unreasonable and unconscionable compensation in violation of Canons \_\_\_\_\_ of the Canons of Professional Ethics of the \_\_\_\_\_, unless authorized by a written order of the court as hereinafter provided.

(b) The following is the schedule of reasonable fees referred to above: either

#### Schedule A

- (i) \_\_\_\_\_ percent of the first one thousand dollars of the sum recovered;<sup>31</sup>
- (ii) \_\_\_\_\_ percent of the next two thousand dollars of the sum recovered;<sup>32</sup>

<sup>31</sup>The percentage is left blank for local determination. The New York rule sets 50% for this provision.

<sup>32</sup>The percentage is left blank for local determination. The New York rule sets 40% for this provision.

- (iii) \_\_\_\_\_ percent of the next twenty-two thousand dollars of the sum recovered;<sup>33</sup>
- (iv) \_\_\_\_\_ percent on any amount over twenty-five thousand dollars of the sum recovered;<sup>34</sup> or

#### Schedule B

A percentage not exceeding \_\_\_\_\_ percent of the sum recovered, if the initial contractual arrangement between the client and the attorney so provides, in which event the procedure hereinafter provided for making application for additional compensation because of extraordinary circumstances shall not apply.<sup>35</sup>

(c) In computing the fee due the attorney (s), such percentage shall be computed on the net sum recovered after deducting taxable costs and disbursements, including expenses for expert medical testimony and investigative or other services properly chargeable to the enforcement of the claim or prosecution of the action. But for the following or similar items there shall be no deduction in computing such percentages: Liens, assignments or claims in favor of hospitals, for medical care and treatment by doctors and nurses, or self-insurers or insurance carriers.

(9) *Fees In Addition To Contract For Extraordinary Expense.* In the event that claimant's or plaintiff's attorney believes in good faith that the foregoing Schedule A, because of extraordinary circumstances, will not give him adequate compensation, application for greater compensation may be made upon affidavit with written notice and an opportunity to be heard to the client and other persons holding liens or assignments on the recovery. Such application shall be made to the judge of the trial court to which the action has been sent for trial; or, if it had not been sent to a court for trial, then to the judge presiding at the \_\_\_\_\_ in which the action had been instituted; or, if no action had been instituted, then to the judge presiding at the \_\_\_\_\_ for the county in the Judicial Department in which the attorney who filed the statement of retainer, pursuant to this rule, has an office. Upon such application, the judge, in his discretion, if extraordinary circumstances are found to be present, and without regard to the claimant's or plaintiff's consent, may fix as reasonable compensation for legal services rendered an amount greater than that specified in the foregoing Schedule A, provided, however, that such greater amount shall not exceed the fee fixed pursuant to the contractual agreement, if any, between the client and the attorney. If the application be granted, the judge shall make a written order accordingly, briefly stating the reasons for granting the greater compensation; and a copy of such order shall be served on all persons entitled to receive notice of the \_\_\_\_\_.

<sup>33</sup>The percentage is left blank for local determination. The New York rule sets 35% for this provision.

<sup>34</sup>The percentage is left blank for local determination. The New York rule sets 25% for this provision.

<sup>35</sup>The percentage is left blank for local determination. The New York rule sets 33 1/4% for this provision.

## Collateral Sources Of Recovery

### PROPOSAL

That the Collateral Source Rule be modified so that evidence of the nature and extent of all benefits and services received or to be received by the claimant as a result of the alleged injuries and damages he sustained be admissible. That evidence of the remarriage of a surviving spouse be likewise admissible in an action for wrongful death.

### DISCUSSION

There is no question that the Collateral Source Rule has a marked effect on the problem of automobile liability insurance cost. Actuarial studies indicate that elimination of double payment of certain items in the average personal injury claim would result in premium savings of between 15 and 19 percent.<sup>36</sup> It has been estimated that the portion of the American population that is covered by collateral benefits providing medical and hospital costs, wage continuation and the like is between 70 and 85 percent and is constantly rising.<sup>37</sup> The continuation of the Collateral Source Rule means that seven or eight of every ten successful claimants will recover at least twice for some economic losses. As inflation forces the cost of medical and hospital care and wages to new highs and as more and more persons become covered by these collateral benefits, the cost to the insurance buying public of continuing the Collateral Source Rule will become even more burdensome.

In the trial of a personal injury action the application of the Collateral Source Rule leads to inequitable results. The plaintiff is allowed to introduce evidence of the economic "loss" sustained as a result of his injury. This will include such items as expenses for medical treatment, hospital and nursing care, prosthetic devices, rehabilitation services and the wages which "would" have been earned during the period he was away from his employment. Even if all of these claimed expenses have been paid at the time of trial by in-

surance or other collateral sources, the defense is prohibited from introducing evidence as to the payment. Thus the jury is led to believe that the plaintiff had to personally pay these expenses or that he has been subjected to continuous financial worry because they are still unpaid at the time of trial. If the jury finds for the plaintiff on the question of liability, this mistaken belief cannot help but be a factor in the jury's determination of the amount to be awarded to the plaintiff for the pain, suffering and inconvenience which were occasioned by the defendant's conduct. There is no question that a more equitable attitude would be exhibited if the jury knew that the plaintiff was not financially strapped pending trial, because of the collateral benefits which were available to him.

The Collateral Source Rule also proves inequitable in another situation. Most jurisdictions hold that evidence of the remarriage of a surviving spouse is inadmissible in actions for wrongful death.<sup>38</sup> In some instances the courts even go to the extent of condoning perjury by insisting that a remarried widow must take the oath and at all times during the trial be referred to by the surname of her late husband. With the rule being applied in these cases, the plaintiff is allowed to introduce evidence, often by expert economists, that had the deceased lived he would have earned a certain amount of money during his working life. Computations are made to arrive at a lump sum figure for pecuniary loss which, if invested, would yield the "widow" a yearly income equivalent to that her late husband would have provided had he lived. When the action is for the death of a wife similar evidence is introduced to show the cost to the surviving husband to hire a housekeeper, cook, babysitter, etc., to replace the services which would have been performed by his wife had she lived. When the wrongful death action is solely for pecuniary loss and evidence of remarriage is excluded, the jury, in appraising the loss, does not know that there is a new husband whose earnings

<sup>36</sup>CRISIS IN CAR INSURANCE 130 and 185 (Keeton, O'Connell & McCord ed 1968)

<sup>37</sup>See notes 11 and 12 *supra*

<sup>38</sup>Shields & Giles, *Remarriage and the Collateral Source Rule*, 36 Ins Counsel J 354 (July 1969)

will supplant lost income or a new wife who will perform the services which the plaintiff is claiming as loss. The courts that prevent introduction of remarriage resort to the windfall argument and confuse an action designed to compensate actual loss for one intended to punish the defendant.<sup>39</sup> It may well be that the reason this evidence is excluded is an attempt to shape an action designed to compensate for pecuniary loss into one which also compensates for the emotional suffering occasioned by the loss of a loved one. However, if compensation for this emotional loss is proper, evidence of remarriage is most relevant. Should a jury be misled into believing that the surviving spouse claiming emotional suffering over the death of a husband or wife will carry that grief for life when in fact, at the time of trial, a new home and hearth have replaced the old?

What is proposed is that the jury be given all the facts about the case before them. That, when they are charged with finding just compensation for actual, pecuniary loss, or even emotional loss, all

material evidence as to the true nature of that loss be presented. We have faith in the jury system and believe that, given all the evidence, an equitable determination of actual damages will be made. To this end we propose that the Collateral Source Rule be modified to allow the introduction of all evidence relative to the nature and extent of the benefits and services received or to be received by the claimant as a result of the alleged injuries and damages he sustained.

## LEGISLATION

### MODIFICATION OF THE COLLATERAL SOURCE RULE<sup>40</sup>

**Evidence Of Collateral Benefits.** In any action in which compensatory damages are sought, the party against whom the action is brought shall be entitled to the admission of evidence as to the nature and extent of any benefits or services received or to be received by the party seeking compensation which were occasioned by the injuries and damages alleged to have been sustained as a result of the occurrence which is the subject matter of the action. Likewise, in any action for wrongful death, evidence as to the remarriage of a surviving spouse shall be admissible.

<sup>39</sup>See, e.g., *Dubil v. Lebate*, 245 A2d 177 (NJ 1968)

<sup>40</sup>Sample statutes and supporting research for the provision on collateral source are available from the DRI Milwaukee office.

## Comparative Negligence

### PROPOSAL

That the determination of whether the rule of contributory negligence should be abandoned is a matter for local determination. However, when the rule is to be changed, the present Wisconsin comparative negligence rule and procedure is preferable and should be substituted.

### DISCUSSION

In the majority of jurisdictions the rule still remains that contributory negligence on the part of a person seeking recovery in a tort action bars his recovery. In the other jurisdictions the rule of comparative negligence (fault) has been adopted.<sup>41</sup> There has been considerable debate over the merits of each system. It is relatively easy to find support for either the position that contributory negligence be retained or that it should be discarded.<sup>42</sup> We believe that the determination as to whether comparative negligence should be adopted is a matter for local determination. Only in this way can all the practical problems which would result from such a change be properly evaluated and considered in light of their impact upon the practice and existing laws of a jurisdiction. Therefore, adopting a national position that each jurisdiction should have comparative negligence is unwise.

However, it is practical to suggest, that where a change is to be made, the present Wisconsin comparative negligence rule and procedure is preferable. The relative mer-

its of the Wisconsin comparative negligence rule and procedure are discussed at length in the supporting research which accompanies the DRI sample legislation on the subject.<sup>43</sup> It is shown to be the most just and workable of the comparative negligence systems, based upon nearly 40 years of practical operation and judicial interpretation.<sup>44</sup>

### LEGISLATION

#### THE COMPARATIVE NEGLIGENCE RULE

**Contributory Negligence.** Contributory negligence shall not bar recovery in an action by any person or his legal representative to recover damages for negligence resulting in death or in injury to person or property, if such negligence was not as great as the negligence of the person against whom recovery is sought, but any damages allowed shall be diminished in the proportion to the amount of negligence attributable to the person recovering.<sup>45</sup>

<sup>43</sup>The sample statute and supporting research for the provision on comparative negligence is available from the DRI Milwaukee office.

<sup>44</sup>Ghiardi & Hogan, *Comparative Negligence — The Wisconsin Rule and Procedure*, 18 *Defense L J* 537 (Oct 1969)

<sup>45</sup>Wisconsin also has procedures for special verdicts and for contribution among joint tortfeasors. Minnesota adopted the Wisconsin comparative negligence rule when Chapter 624 of the Laws of 1969 was approved on May 23, 1969. It provided for special verdicts and contribution by adding the following language to the statute set forth above:

The court may, and when requested by either party shall, direct the jury to find separate special verdicts determining the amount of damages and the percentage of negligence attributable to each party; and the court shall then reduce the amount of such damages in proportion to the amount of negligence attributable to the person recovering. When there are two or more persons who are jointly liable, contribution to awards shall be in proportion to the percentage of the negligence attributable to each, provided, however, that each shall remain jointly and severally liable for the whole award.

<sup>41</sup>Arkansas, Georgia, Hawaii, Massachusetts, Maine, Minnesota, Mississippi, Nebraska, New Hampshire, South Dakota, Wisconsin.

<sup>42</sup>Compare Lambert, *Case For Comparative Negligence*, 2 *Trial Lawyers Q* 16 (1965) with Powell, *Contributory Negligence: A Necessary Check on the American Jury*, 43 *ABA J* 1005 (Nov 1957)

## Advance Payments

### PROPOSAL

That liability insurers be given the right to make advance payments for economic loss to claimants without the possibility that the claimants will be allowed to introduce evidence of the advance payments on the issue of liability during subsequent litigation. That liability insurers making advance payments be allowed to take a credit therefore against any subsequent judgment recovered by the claimant or settlement made with him.

### DISCUSSION

The insurance industry has voluntarily undertaken the development of many innovative claims handling techniques in recent years. One of the most significant has been the advance payment technique. In cases in which final settlement of the full claim cannot be made at once, this procedure has allowed the insurer to make periodic payments to the claimant for medical expenses, wage loss and for property damage, often without taking any form of release. There appears to be no argument with the position that this procedure is valuable and worthwhile.<sup>46</sup> With expanded use of the advance payment technique, coupled with the proposed first party insurance coverage, the criticism that the present system delays payments for economic loss to persons who are in need should have no further foundation.

The legislative proposal would prevent evidence of the advance payment from being introduced in a lawsuit and would give the insurer making the payment the right to a credit against any subsequent judgment or settlement.

<sup>46</sup>*Advance Payments — View of Plaintiffs' Counsel*, 9 For The Defense 59 (Oct 1968); *New Ideas for Personal Injury Claim Settlements*, 8 For The Defense 41 (June 1967); *Advance Payment Techniques*, 7 For The Defense 57 (Oct 1966)

### LEGISLATION

#### EVIDENCE REGARDING ADVANCE PAYMENTS<sup>47</sup>

**Advance Payments.** (1) In any action in which the defendant, his insurer or any other person has made an advance payment to or on behalf of any claimant prior to trial, any evidence of or concerning said advance payment shall be inadmissible in evidence (or as an admission against liability) in any action brought by the claimant, his survivors or personal representative, to recover damages for personal injuries or for the wrongful death of another, or for property damage or destruction.

(2) In the event, however, that such action results in a verdict in favor of the claimant (in excess of payments) the defendant shall be allowed to introduce evidence of such payments after the verdict has been rendered and the court shall then reduce the amount awarded to the claimant by the amount of payments made prior to trial.

(3) For the purpose of paragraph one (1) above, the word "advance payment" shall be construed to include, but not limited to the following: Any partial payment, loan or settlement made by any person, corporation or insurer thereof, to another, which is predicated upon possible tort liability or under the contractual obligations of the insurer to the injured party or on his behalf, e.g., medical, surgical, hospital, rehabilitation services, facilities or equipment, loss of earnings, out-of-pocket expenses, death claims, loans, bodily injury or property damage, loss or destruction.

(4) This statute shall be applicable to any action commenced in this state, regardless of the situs of the accident, location of the property or residence of the parties.

(5) The making of an advance payment shall not interrupt the running of the Statute of Limitations, provided that any person, including any insurer, who makes such advance payment, shall at the time of the first payment, notify the recipient thereof in writing of the date the applicable Statute of Limitations will expire.

(6) If the defendant does not desire to introduce evidence of such payments after the verdict has been rendered, he shall be allowed to introduce such evidence during the trial, and the jury shall be instructed to take such payments into consideration in determining the amount of damages, if any, awarded to the plaintiff.

<sup>47</sup>Sample statutes and supporting research for the provision on advance payments are available from the DRI Milwaukee office.

## Elimination Of Ad Damnum

### PROPOSAL

That any pleading demanding relief in the form of unliquidated damages may only make a prayer for general relief and state that the amount claimed is within the minimum and maximum jurisdictional limits of the court.

### DISCUSSION

Historically, the *ad damnum* clause was developed as a means by which the litigant could be shown to be demanding money damages instead of some other form of relief. Its role in the litigation process was actually a minor one. Today, the only practical purpose served by the clause is in the determination of whether the action is within the jurisdictional limits of the court involved.

The present use of the *ad damnum* in personal injury litigation has given rise to much abuse and dissatisfaction.<sup>48</sup> Lawyers admit that the amount of money demanded in a complaint has no real relation to the sum which would be accepted as a reasonable settlement. A claimant who sees his lawyer demand a huge sum in a pleading has difficulty understanding why acceptance of a much smaller amount is recommended by the same lawyer as a settlement. A person who is involved in a minor accident and is later served with a pleading demanding an excessive dollar amount tends to view the lawyer as one engaged in a form of extortion. The news media pick up a multi-figure demand and report it to the public as a "front page" news item but give little if any attention to the final determination of the case if it

results in an award or settlement for a conservative amount. Thereby the public receives a distorted view of the "value" of personal injury claims.

Since many states have trial courts with varying jurisdictional limits depending upon the amount in suit, there is a need for the pleadings to indicate whether the amount of unliquidated damages sought are within that jurisdiction. The proposal seeks to do this without the necessity of having those pleadings state an exact dollar demand. Absent the need to establish that the action is within the jurisdiction of the court, there is no practical reason for the continuation of the use of the dollar demand *ad damnum*.

### LEGISLATION

#### ELIMINATION OF THE AD DAMNUM CLAUSE<sup>49</sup>

**Claims For Relief.** (1) Any pleading demanding relief for unliquidated damages shall without claiming any specific sum, set forth only whether the amount is in excess of, or not in excess of \$10,000, and that the total of said sum claimed is within the minimum and maximum jurisdiction of the court.<sup>50</sup>

(2) The court on its own motion or motion of any party may, by deposition, pre-trial conference, hearing or otherwise, determine the amount actually in controversy and enter an order of reference to a Board of Arbitration or of transfer to another court, or such other order as may be appropriate. For the purpose of appeal, jurisdiction of the appellate court will be fixed according to such court order, or the judgment obtained, whichever is the greater.

<sup>48</sup>Sample statutes and supporting research for the provision on the elimination of the *ad damnum* clause are available from the DRI Milwaukee office.

<sup>50</sup>The reference to \$10,000 in subsection (1) is necessary to determine if the case is subject to federal removal jurisdiction.

<sup>48</sup>See *The Ad Damnum Clause - The Problem and Solution* (DRI monograph Aug 1965)

## Fraudulent Claims

### PROPOSAL

Strict sanctions should be imposed upon those who intentionally make claims for personal injury or property damage known by them to be false or fraudulent and upon those who assist in the making of such claims with knowledge of their false or fraudulent character.

### DISCUSSION

Unfortunately, there are a small number of persons who look upon the personal injury reparation system as a means of making easy money. Although the number of false or fraudulent claims made annually is small in comparison to the total number of claims, they do constitute a serious threat to the integrity of the legal system. The money they take from the system is taken at the expense of the premium paying public and those whose personal injury claims are valid.

The only significant means which can be employed to combat the filing of false and fraudulent claims is to provide strict penalties for those who engage in this practice. It is proposed that where local laws

are not adequate to cope with this problem, strong legislative measures be enacted.

### LEGISLATION

#### PENALTIES FOR BRINGING FRAUDULENT CLAIMS

**Fraudulent Claims.** (1) Whoever, with the intent to defraud, obtains or assists in obtaining any money or other thing of value from any other person or any insurance company in this state by falsely or fraudulently representing that an injury has been sustained or damage to property has occurred, or the extent of said injury or damage, may be fined not more than \$2,500 or imprisoned not more than 5 years or both.

(2) Whoever, with the intent to defraud, attempts to obtain, or assists in attempting to obtain any money or other thing of value from any other person or any insurance company in this state by falsely or fraudulently representing that an injury has been sustained or damage to property has occurred, or the extent of said injury or damage, may be fined not more than \$2,500 or imprisoned not more than 5 years or both.

(3) In order to establish that there exists an intent to falsely and fraudulently represent an injury or damage to property, or the extent thereof, it shall be admissible to present a history of prior convictions for the violation of this statute or similar crimes committed within a previous five-year period; but no such evidence shall be essential to sustain a successful prosecution.

## Efficient Use Of Legal Effort

### PROPOSAL

That those practices and procedures which provide for limitation of the right to voluntary dismissals or nonsuits, the right to a split trial on issues of liability and damages, modification of appeal bond rules, summary judgment, mental and physical examinations of litigants, demands to admit the genuineness of documents or relevant facts, and offers of settlement, judgment and damages should be adopted in those jurisdictions which do not have such rules and also in those jurisdictions whose present rules are not as workable as those which are proposed.

### DISCUSSION

A number of specific proposals have been grouped into this section. As its title implies, their purpose is to make more efficient use of the legal effort — to employ the trial for only those cases and issues that can be resolved in no other way and to see to it that the trial is as efficient a process as possible.

Experienced trial lawyers are aware that much can be done to save the time and effort of judges, court personnel, litigants, witnesses and attorneys.<sup>51</sup> The enactment of any or all of these proposals would, each in its own way, make the preparation and trial of a personal injury case less costly, less cumbersome and less time consuming. Other proposals to streamline the judicial process can be devised and proposed; however, the legislation or court rules suggested here would be a major step forward.

### LEGISLATION

#### LIMITATIONS UPON VOLUNTARY DISMISSALS OR NONSUITS<sup>52</sup>

**Voluntary Dismissal Or Nonsuit.** (1) An action may be dismissed by the plaintiff or other party asserting an affirmative claim, in the form of a

<sup>51</sup>See, e.g., *Defense Research Committee — Report and Recommendations for the Most Efficient Use of the Legal Effort*, 90 Ins Counsel J 519 (Oct 1963) [reprints available from the DRI Milwaukee office]

<sup>52</sup>Sample statutes and supporting research for the provision on voluntary dismissal or nonsuit are available from the DRI Milwaukee office.

counterclaim, cross-claim or third-party claim without order of the court by (a) filing a notice of dismissal at any time before joinder of issue, or (b) filing a stipulation of dismissal signed by all parties who have appeared in the action. Unless otherwise stated in the notice of dismissal or stipulation, the dismissal shall be without prejudice, except that a notice of dismissal operates as an adjudication upon the merits when: (a) filed by a plaintiff who has once dismissed in any court of this state, or of any other state, or in any court of the United States, based on or including the same claim; and (b) if plaintiff or other party shall fail to perfect an appeal within 60 days after the motion to vacate or set aside the order of dismissal is ruled upon by the trial court; or (c) plaintiff shall fail to refile said cause within one year after the first dismissal.

(2) Except as provided in paragraph (1), an action shall not be dismissed at the plaintiff's instance save upon order of the court and upon such terms and conditions as the court deems proper. If an independent affirmative claim has been filed by any party other than plaintiff and served upon plaintiff prior to the service of plaintiff's motion to dismiss, the action shall not be dismissed against the other party's objection unless the counterclaim, cross-claim or third-party claim can remain pending for independent adjudication by the court.

(3) Unless otherwise specified in the order, a dismissal under paragraph (2) is with prejudice. The court may also condition its order to cause plaintiff to pay all the legal expense of suit in order to be able to refile said cause.

#### SEPARATE TRIALS ON ISSUES OF LIABILITY AND DAMAGES<sup>53</sup>

**Split Trials.** (1) In any action involving personal injury, and all other civil litigation wherein the issue of liability may be adjudicated as a prerequisite to the determination of any or all other issues, in a jury or non-jury case, a separate trial may be had upon such issue of liability, upon motion of any of the parties, or at the Court's discretion, in any claim, cross-claim, counterclaim or third-party action.

(2) In the event liability is sustained, the Court may recess for pre-trial or settlement conference, or proceed with the trial on any or all of the remaining issues before the Court, before the same jury or before another jury as conditions may require and the Court shall deem best.

(3) The Court, however, may proceed to trial upon all or any combination of issues if, in its discretion, and in furtherance of justice, it shall appear that a separate trial will work hardship upon any of the parties or will result in protracted or costly litigation.

<sup>53</sup>Sample statutes and supporting research for the provision on split trials are available from the DRI Milwaukee office.

### MODIFICATION OF APPEAL BOND PROCEDURES<sup>34</sup>

**Supersedes Bonds.** If an appeal is taken from a judgment or order entered against an insured in any action which is defended by an insurance corporation, or other insurer, on behalf of the insured under a policy of insurance the limit of liability of which is less than the amount of said judgment or order, all proceedings to enforce the judgment or order to the extent of the policy coverage shall be stayed without court order, pending the appeal, and no action shall be commenced or maintained against the insurer for payment under the policy pending appeal, where the insurer:

- (a) Files with the clerk of court in which the judgment or order is entered, a sworn statement of one of its officers, describing the nature of the policy and the amount of coverage, together with a written undertaking that if the judgment or order appealed from, or any part of it, is affirmed, or the appeal dismissed, the insurer shall pay the amount directed to be paid by the judgment or order, or the part of it as to which the judgment or order is affirmed, to the extent of the limit of liability in the policy, plus interest and costs;
- (b) Serves a copy of such sworn statement and undertaking upon the judgment creditor or his attorney; and
- (c) Delivers or mails to the insured at the latest address of the insured appearing upon the records of the insurer, written notice that the enforcement of such judgment or order, to the extent that the amount it directs to be paid exceeds the limit of liability in the policy, is not stayed in respect to the insured. A stay of enforcement of the balance of the amount of the judgment or order may be imposed by giving an undertaking as provided in other cases, in an amount equal to that balance.

### PROVISIONS FOR SUMMARY JUDGMENT PROCEDURE<sup>35</sup>

**Summary Judgment.** (1) *Motion For Summary Judgment.* Any party to an action may move with or without supporting affidavits for a summary judgment in his favor on all or any part of his claim, counterclaim, cross-claim or third-party claim, after the time for filing a responsive pleading shall have expired, and in no case shall such motion be timely until the defendant shall have answered.

(2) *Grounds.* The motion for summary judgment shall state that the moving party is entitled to judgment in his favor because, except as to the amount of damages, there is no genuine issue as to any material fact, and the moving party is therefore entitled to judgment as a matter of law.

(3) *Motion And Proceedings Thereon.* A motion for summary judgment may be supported by affidavits, and the opposing party, prior to the day

<sup>34</sup>Sample statutes and supporting research for the provision on supersedeas bonds are available from the DRI Milwaukee office.

<sup>35</sup>Sample statutes and supporting research for the provision on summary judgment are available from the DRI Milwaukee office.

of hearing, may serve opposing affidavits. The affidavits submitted by either party shall be made on personal knowledge, shall set forth such facts as would be admissible in evidence, and shall show affirmatively that the affiant is competent to testify to the matters stated therein. Sworn or certified copies of all papers or parts thereof referred to in an affidavit shall be attached thereto or served therewith. The court may permit affidavits to be supplemented or opposed by depositions, answers to interrogatories, or further affidavits. Such affidavits, together with the pleadings, depositions, admissions and documentary evidence then filed in the action or submitted by the parties shall be considered by the court at the hearing. Judgment shall be rendered forthwith if the pleadings, depositions, admissions and other documentary evidence show that any party is entitled to judgment as a matter of law or if the affidavits or other proof show that there is no genuine issue of fact. If it appears that the opposing party rather than the moving party is entitled to judgment, the court may render summary judgment in his favor without the necessity of a motion therefor.

(4) *The Effect Of A Partial Order.* If an application for summary judgment is denied or if the judgment rendered does not dispose of the entire action or grant all of the relief demanded, the court shall fix the time for further pleading or amendment, if any is necessary. By examining the evidence before it and by interrogating counsel, the court shall ascertain what material facts are without substantial controversy, including the extent to which the amount of damages or other relief is not in dispute, and such facts will be deemed established for all purposes in the action. In lieu of such order the court may treat the hearing and any continuation thereof as a conference, at the conclusion of which the judge shall prepare a summary of results specifically covering each of the items stated in the rules on pre-trial conferences.

(5) *Appealability Of Interim Orders.* No findings or orders of the court shall be appealable, unless such order fully and finally determines all the issues in the case, except when the court shall determine the issue of liability or damages separately, in which case, the order or finding of liability or damages shall be appealable and the final determination of the cause shall be suspended, or proceed according to such order as the court may deem just.

### PHYSICAL AND MENTAL EXAMINATIONS — PHYSICIAN PATIENT PRIVILEGE<sup>36</sup>

**Physical And Mental Examination Of Persons.**

(1) *Order of Examination.* When the mental or physical condition or the blood condition of a party, or of an agent of a party, or of a person under control of a party, is in controversy, the court in which the action is pending may order the party to submit to, or produce such agent or person for, a mental or physical or blood examina-

<sup>36</sup>Sample statutes and supporting research for the provisions on physical and mental examinations and the physician patient privilege are available from the DRI Milwaukee office. See also, Wienke & Hogan, *The Physician Patient Privilege in Personal Injury Litigation — A Proposed Reform* (DRI monograph July 1968)

tion by a physician. The order may be made only on motion for good cause shown and upon notice to the party or person to be examined and to all other parties and shall specify the time, place, manner, conditions, and scope of the examination and the person or persons by whom it is made.

- (2) *Report Of Findings.* (a) If requested by the party against whom an order is made under Section 1 or by the person examined, the party causing the examination to be made shall deliver to him a copy of a detailed written report of the examining physician setting out his findings and conclusions, together with like reports of all earlier examinations of the same condition. After such request and delivery, the party causing the examination to be made shall be entitled, upon request, to receive from the party or person examined a like report of any examination, previously or thereafter made, of the same mental or physical or blood condition. If the party or person examined refuses to deliver such report, the court, on motion and notice, may make an order requiring delivery on such terms as are just, and, if a physician fails or refuses to make such a report, the court may exclude his testimony if offered at the trial.
- (b) By requesting and obtaining a report of the examination so ordered or by taking the deposition of the examiner, the adverse party waives any privilege he may have in that action or any other involving the same controversy, regarding the testimony of every other person who has examined or may thereafter examine him or the person under his control in respect of the same mental or physical or blood condition.
- (c) This subsection applies to examinations made by agreement of the parties, unless the agreement expressly provides otherwise. This subsection does not preclude discovery of a report of an examining physician in accordance with the provisions of any other statute or rule.

**Physician Patient Privilege.** (1) *Definitions.*

- (a) "Physician." As used in this section, "physician" means a person authorized or reasonably believed by the patient to be authorized, to practice medicine in the state or jurisdiction in which the consultation or examination takes place.
- (b) "Patient." As used in this section, "patient" means a person who, for the sole purpose of securing preventive, palliative or curative treatment, or a diagnosis preliminary to such treatment, of his physical or mental condition, consults a physician, or submits to an examination by a physician.
- (c) "Confidential communication between patient and physician." As used in this section, "confidential communication between patient and physician" means information, including information obtained by an examination of the patient, transmitted between a patient and his physician in the course of that relationship and in confidence by a means which, so far as the patient is aware, discloses the information to no third persons other than those who are present

to further the interest of the patient in the consultation or those to whom disclosure is reasonably necessary for the transmission of the information or the accomplishment of the purpose for which the physician is consulted, and includes advice given by the physician in the course of that relationship.

- (d) "Holder of the privilege." As used in this section, "holder of the privilege" means:
- (i) The patient when he has no legal representative.
  - (ii) The legal representative of the patient, when the patient is dead, or when another person has custody or legal control over the patient.

(2) *The Privilege.* In the absence of a consent, waiver, or stipulation by the holder of the privilege to the contrary, and except as otherwise provided in this section, the holder of the privilege, whether or not a party, has a privilege to refuse to disclose, and to prevent another from disclosing, a confidential communication between patient and physician if the privilege is claimed by:

- (a) The holder of the privilege;
- (b) A person who is authorized to claim the privilege by the holder of the privilege; or
- (c) The person who was the physician at the time of the confidential communication, but such person may not claim the privilege if there is no holder of the privilege in existence or if he is otherwise instructed by a person authorized to permit disclosure.

(3) *Exception.* There is no privilege under this section as to a communication relevant to an issue concerning the condition of the patient if such issue has been tendered by:

- (a) The patient;
- (b) Any party claiming for, through or under the patient;
- (c) Any party claiming as a beneficiary of the patient through a contract to which the patient is or was a party;
- (d) A party in an action brought for damages for the injury or death of the patient.

(4) *Medical Disclosures.* When a party mentioned in the above Subsection (3) tenders the issue of the condition of a patient under the above Subsection (3), such party within ten (10) days of written request by any other party

- (a) Shall furnish to the requesting party copies of all medical reports previously or thereafter made by any treating or examining medical expert, and
- (b) Shall provide written authority signed by the party of whom the request is made to permit the inspection and disclosure of all hospital or medical records and information, concerning the physical, mental or blood condition of such patient as to whom above Subsection (3) applies.

Disclosures under this Rule shall include the conclusions of such treating or examining medical expert.

This subsection does not preclude discovery of any medical information in accordance with the provision of any other statute or rule.

### DEMAND TO ADMIT GENUINENESS OF DOCUMENTS OR FACTS<sup>87</sup>

**Request for Admission.** (1) After commencement of an action a party may serve upon any other party a written request for the admission by the latter of the genuineness of any relevant documents described in and exhibited with the request, or of the truth of any relevant matters of fact set forth in the request. If a plaintiff desires to serve a request within 20 days after commencement of the action, leave of court, granted with or without notice, must be obtained. In all other cases, the written request for admission of the genuineness of documents or other facts shall be made no later than four weeks prior to the date set for trial of the action, except upon notice, motion and leave of the trial court for cause shown. Copies of the documents shall be served with the request unless copies have already been furnished. Each of the matters of which an admission is requested shall be deemed admitted unless, within a period designated in the request, not less than 20 days after service thereof or within such shorter or longer time as the court may allow on motion and notice, the party to whom the request is directed serves upon the party requesting the admission either:

- (a) A sworn statement denying specifically the matters of which an admission is requested or setting forth in detail the reasons why he cannot truthfully admit or deny those matters; or,
  - (b) Written objections on the ground that some or all of the requested admissions are privileged or irrelevant or that the request is otherwise improper in whole or in part, together with a notice of hearing the objections at the earliest practicable time. If written objections to a part of the request are made, the remainder of the request shall be answered within the period designated in the request. A denial shall fairly meet the substance of the requested admission and when good faith requires that a party deny only a part or a qualification of a matter of which an admission is requested, he shall specify so much of it as is true and deny only the remainder.
- (2) **Effect of Admission:** Any admission made by a party pursuant to such request is for the purpose of the pending action only and neither constitutes an admission by him for any other purpose nor may it be used against him in any other proceeding.<sup>88</sup>
- (3) **Expenses on Refusal to Admit:** If a party, after being served with a request under the above rule to admit the genuineness of any documents or the truth of any matters of fact, serves a sworn denial thereof and if the party requesting the admissions thereafter proves the genuineness of any such document or the truth of any such matter

<sup>87</sup>The sample statute and supporting research for the provision on the demand to admit the genuineness of documents or facts is available from the DRI Milwaukee office.

<sup>88</sup>Paragraph (2) is included, but any drafter is admonished to examine the policy regarding admissions of facts or documents under applicable state law. Inclusion of this paragraph is therefore expressly discretionary.

of fact, he may apply to the court for an order requiring the other party to pay him the reasonable expenses incurred in making such proof, including reasonable attorneys fees. Unless the court finds that there were good reasons for the denial or that the admissions sought were of no substantial importance, the order shall be made.

### OFFERS OF JUDGMENT, DAMAGES OR SETTLEMENT<sup>89</sup>

**Offer Of Judgment.** (1) After issue is joined and no later than four weeks before the trial date, except upon motion, notice and due cause shown the defendant-party (which shall include the parties whether denominated as defendant by reason of the complaint, counterclaim or third-party claim) may serve upon the plaintiff and his counsel, a written offer to allow judgment to be taken against him for the sum, or property, or to the effect therein specified, with costs. If the plaintiff accepts the offer and serves notice thereof in writing, before acceptance, and within 20 days, he may file the offer, with proof of service of the notice of acceptance and the clerk must thereupon enter judgment accordingly, provided the summons and complaint have been filed. If notice of acceptance is not given, the offer cannot be given as evidence nor mentioned on the trial. If the offer of judgment is not accepted and the plaintiff fails to recover a more favorable judgment, he shall not recover costs, but the defendant-party shall recover costs as hereinafter defined in section (4).

(2) **Offer Of Damages.** After issue is joined but before trial the defendant-party may serve upon the plaintiff and his counsel, a written offer that if he fails in his defense, the damages be assessed as a specified sum. If the plaintiff accepts the offer and serves notice thereof in writing before trial and within 20 days, and prevails upon the trial, either party may file proof of service of the offer and acceptance and the damages will be assessed accordingly. If notice of acceptance is not given the offer cannot be given as evidence nor mentioned on the trial. If the offer is not accepted and if damages assessed in favor of the plaintiff do not exceed the damages offered, the defendant-party shall recover his costs, as set forth hereinafter in section (4).

(3) **Offer Of Settlement.** After issue is joined but no later than four weeks prior to the trial date, except upon motion, notice and due cause shown, the plaintiff may serve upon the defendant and his counsel, a written offer of settlement. If the defendant accepts the offer and sends notice thereof in writing before trial and within 20 days, he may file the offer with proof of service of the notice of acceptance and the clerk must thereupon enter judgment accordingly. If notice of acceptance is not given, the offer cannot be given as evidence nor mentioned on the trial. If the offer of settlement is not accepted and the plaintiff prevails for the amount of the offer of settlement or in excess of such offer of settlement, the plaintiff shall recover his costs, as set forth in section (4), if such costs are not ordinarily assessed against the defendant under other state statutes or court rules.

<sup>89</sup>The sample statute and supporting research for the provision on offers of judgment, damages or settlement is available from the DRI Milwaukee office.

- (4) *Costs.* (a) The term "costs" in the above rule shall include the expenses properly chargeable to the presentation of the case, by either party, and means those expenses, including a reasonable attorney fee, made necessary by the nature of the action and which are in addition to the ordinary items of expenses attributable to the conduct of the attorney's practice, including but not exclusive of, expert witness fees, investigation, preparation of evidence for trial and such costs properly chargeable under any other statute, such as suit fees, witness fees, mileage, etc.
- (b) Attorneys fees awarded to either party shall not be in excess of those previously contracted for by the parties and their counsel. Plaintiff's attorney fees shall be governed by any contingent fee agreement that exists between plaintiff and his counsel, but shall not exceed the minimum bar association per diem fees for time in actual litigation. Defendant's attorney fees shall be based on the same fee schedule.

## Regulation Of Awards For Pain And Suffering

### PROPOSAL

That an attempt be made to formulate a plan which will serve as a guide to the appraisal of fair compensation for pain, suffering and inconvenience which result from the injury sustained through the fault of another.

### DISCUSSION

Many of the proposals which seek to modify the existing automobile accident reparations system have in common a limitation on the right to recover damages for pain and suffering. The Keeton-O'Connell plan would eliminate the right to such a recovery for those whose damage for pain and suffering is less than \$5000.<sup>60</sup> The American Insurance Association plan would do away with this right of recovery completely.<sup>61</sup> The Cotter proposal<sup>62</sup> and the Quick Settlement Option plan<sup>63</sup> that was developed and offered for consideration by the ABA Special Committee on Automobile Accident Reparations set up formulae to be applied in certain cases so as to limit damages for pain and suffering to a multiple of medical expenses. The common thread that may be pulled from all of these proposals and plans is that automobile insurance costs could be lowered if the recoverable damages for pain and suffering were in some way reduced or eliminated. Interestingly enough, these proposals and plans focus solely on the automobile accident victim for the elimination or limitation of pain and suffering awards. All persons injured as the result of negligent or intentional conduct not associated with the operation of an automobile would still be able to seek full compensation for pain and suffering if any of these plans or proposals became operative.

We believe that pain and suffering should continue to be compensable in all

personal injury actions. A person who suffers pain, discomfort and inconvenience as the result of the carelessness or intentional conduct of another sustains a loss as real as the medical and hospital expenses incurred to alleviate the injury which caused them. A person should not be denied recovery for the pain and suffering he has endured simply because its severity does not measure up to some artificial quantum. Pain is just as real and dreadful to the person who endures it for one day as it is for the one who must withstand it for a week or month. Further, pain is an individual thing and varies with each person. This variation is to be considered and not discarded as it would be with a formula approach.

While we believe that a person should continue to receive full compensation for tortiously caused pain and suffering, we also believe that an attempt should be made to formulate a plan which would serve as a guide to the appraisal of fair compensation for this element of damage. The present system has been criticized because juries have no fixed standard to use in assessing an award for pain and suffering. We are convinced that juries have been performing their function well without a fixed standard; however, we believe that their task could be made more easy if some fair and objective guide lines were available for their use.

The Cotter proposal and the Quick Settlement Option of the ABA Special Committee were attempts to develop such a standard. Under these proposals an award for pain and suffering is computed on a formula based upon a multiple of the claimant's medical expenses. Such an approach does offer ease in computation of the award. However, it does have shortcomings. In many instances medical expenses have little relation to the severity of the pain and suffering that has been endured. Therefore, strict adherence to such a formula, without any consideration of the claimant's individual experience of pain and suffering, would lead to under-compensation for some claimants and over-

<sup>60</sup>Keeton & O'Connell, note 1 *supra* at 7

<sup>61</sup>AIA Report, note 15 *supra* at 5

<sup>62</sup>House Bill 7107, Conn Gen Assembly (Jan Sess 1969)

<sup>63</sup>Report of the American Bar Association Special Committee on Automobile Accident Reparations, at 101 (June 1969)

compensation for others. This artificial formula approach would also produce a temptation to build up medical expenses so that the award for pain and suffering would be greater.

The artificial formula approach then has its drawbacks. Justice cannot be measured with a yardstick or a slide rule. What is needed is a standard to guide the jury in its assessment of damages for pain and suffering which is not artificial but which

takes into account the individual differences of claimants and their individual experiences of pain and suffering. To our knowledge serious research has never been conducted in this area. We will devote research efforts and also seek the assistance of others in an attempt to develop such a standard or standards. We do not believe that this will be an easy task, but in light of the solutions to the problem which have been offered to date it is a necessary task.

## AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

THURSDAY, MAY 6, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met at 11 a.m., pursuant to recess, in room 5110, New Senate Office Building, Hon. Warren G. Magnuson (chairman of the Committee) presiding.

Present: Senators Magnuson and Hart.

The CHAIRMAN. The committee will resume its hearings on the insurance bills. Robert Joost is the next witness.

We will be glad to hear from you. I understand that you are employed by the American Trial Lawyers Association, is that correct?

### STATEMENT OF ROBERT H. JOOST

Mr. Joost. I am from the American Trial Lawyers.

My name is Robert H. Joost. I am a lawyer, and I am employed by the American Trial Lawyers Association at its headquarters in Cambridge, Mass.

I am submitting this statement for the record in favor of pending legislation in the Congress to establish on a nationwide basis a system of compensation of victims of automobile accident regardless of fault.

Since the American Trial Lawyers Association opposes no-fault automobile insurance legislation, I am submitting this statement for myself only and not for the association.

The CHAIRMAN. Can I interrupt just a minute. Do we have a formal statement in opposition from the Trial Lawyers Association?

Senator HART. They testified yesterday in very strong opposition.

Mr. Joost. First to establish my own professional credentials, I am a graduate, magna cum laude, of the Harvard Law School, where I was an editor of volumes 72 and 73 of the Harvard Law Review, and I am a graduate, magna cum laude, of Yale College, where I was a member of Phi Beta Kappa. I have also studied at Columbia University as a graduate student in economics.

In addition to my professional work from 1962 to the present for the American Trial Lawyers Association—until 1964 it was called the NACCA Bar Association—I have been heavily involved in two major statutory reform efforts in Massachusetts. I participated in the molding and remodeling of the new Massachusetts mental health code, which goes into effect July 1, as a member of the legal studies staff of the Massachusetts Special Commission on Mental Health and as a member of the Attorney General's Committee on Commitment Law Revision, and since 1968 I have been a reporter for the Criminal Law Revision

Staff member assigned to these hearings: S. Lynn Sutcliffe.

Commission of Massachusetts which is engaged in revision of the substantive criminal law of the State.

Also, from 1967 to 1971 I was a part-time law professor at the New England School of Law in Boston. I have published articles and comments on a variety of legal subjects, the most recent being a piece called "Housing and the Law: An Overview," published in 6 New England Law Review 1 (1970).

I am a member of the Massachusetts bar, and a member of the American, Massachusetts, and Boston Bar Associations, the American Trial Lawyers Association, and the American Judicature Society.

My present post with the American Trial Lawyers Association is assistant to the chairman of the legislative section, which I have held since 1968. For a period I was called special counsel but the title was changed to assistant to the chairman in 1969.

I am also consulting editor of Trial magazine, the bimonthly national legal news magazine published by ATL. As a matter of fact, I am the only lawyer on the editorial staff of this magazine. Copies of letterhead stationery which indicate my position are attached to my formal statement.

I was first employed by the trial lawyers in 1962, as assistant to the editor of the NACCA Law Journal, which is now called the Journal of the American Trial Lawyers. In that capacity, between 1962 and 1964, I wrote a substantial percentage of the articles published in volumes 29, 30, and 31 of the journal. From 1964 to 1967, I worked for the association on a part-time basis as the paid author of a regular column in Trial magazine entitled "A Brief Sweep" in which I synopsized current law-review articles of interest. I accepted a full-time position as an editor of Trial in September of 1967.

In addition to almost a decade with the trial lawyers association itself, I also practiced law for 2 years with a law firm in Boston that concentrates on automobile negligence work—Sheff & McGarry; one of the partners was then a member of the board of governors of the American trial lawyers. The firm is typical of many such law firms across the Nation.

As an ATL staff member, I have attended numerous national meetings of the trial lawyers—two in Denver, one here in Washington, D.C., one in Las Vegas, one in San Francisco, and one in the Bahamas. In 1970, I arranged and attended regional meetings of Key Men—that is, members interested in influencing legislative action—in Cambridge, Las Vegas, Atlanta, Chicago, and Denver.

In 1971 to date, I have been to two such Key Men meetings; the 1971 meetings were devoted exclusively to how to defeat no-fault—completely—at both State and Federal levels.

This statement is thus based on long personal involvement with and observation of the principal opponents of legislation aimed at compensating automobile accident victims regardless of fault—the trial lawyers.

I am submitting this statement in support of the Hart-Magnuson bill as an act of conscience, as an attorney, and as a citizen. It is also submitted with sadness for I had hoped that the association itself would see and would accept the fact that we lawyers must put aside our personal pocketbook interest where the public interest conflicts.

Unfortunately, the group in control of ATL has refused to concede that there is such a conflict and has refused to accept that a profes-

sional association of attorneys has a higher obligation than maintenance of personal income.

As a matter of fact, the group in control has never even polled the membership on no-fault versus negligence because no-fault is viewed as putting them out of business.

I myself have been in favor of no-fault automobile insurance, at least in part, for some time, I reviewed the trailblazing book by Profs. Robert E. Keeton and Jeffrey O'Connell, "Basic Protection for the Traffic Victim," in the spring 1966 issue of the *Portia Law Journal*, at pages 266 to 267. In that review, I called the book a "pathfinder in a difficult area," and as to the no-fault plan advocated by the authors, I concluded:

The proposed statute is a careful attempt at reform. If substantially enacted, it would provide a fairer and more sensible solution to the grave national problem of compensating automobile accident victims.

A copy of that review is attached to my statement.

I attach also a copy of a letter to the editor of the *Boston Globe* published December 6, 1966, in which I criticized then Gov. John A. Volpe for his opposition at the time to the no-fault concept. In this letter, I declared in conclusion:

The Keeton-O'Connell plan is far from perfect, but unless something better comes along it should be seriously considered and tried.

I am pleased personally that in 1970 Massachusetts, under the leadership of Michael Dukakis, a Democrat, and Francis Sargent, a Republican, did seriously consider and enact into law a no-fault automobile insurance law. As both Governor Sargent and Mr. Dukakis have testified to a subcommittee of the House of Representatives, the results in Massachusetts, so far, exceed the most sanguine expectations of the proponents.

I attach a letter by Mr. Dukakis published in the *Boston Globe* of April 30, 1971, in which he calls for extending these benefits to all the people through a national no-fault system.

When I was hired by the American trial lawyers on a full-time basis in 1967, I had to agree to make no public statements in opposition to the position of the association. My personal views, however, did not change.

The CHAIRMAN. Mr. Joost, do the American trial lawyers have their national headquarters here in town?

Mr. Joost. No, in Cambridge, Mass. We have a Washington representative, but the headquarters are in Cambridge across the Cambridge common from the Harvard Law School.

To reiterate, my personal views did not change. As a matter of fact, my enthusiasm for the no-fault approach to automobile reparations increased. While my original decision to favor the Keeton-O'Connell plan might have stemmed, at least in part, from the fact that I studied torts from its principal author, Professor Keeton, and because Mr. Keeton was instrumental in getting me my first job with NACCA in 1962, my editorial position with *Trial* starting in September 1967 gave me the time and the access to books and reports which were necessary to a true appreciation of all the issues involved.

Let me state formally for the record: In my judgment, based on my years of study, thought, and observation, I believe that a system of automobile reparations based on compensation of all the tangible losses

of all victims of automobile accidents in the United States without regard to fault would be a much better system than the present one based on compensation of all the tangible and intangible losses of victims but only if the victim proves that a financially solvent defendant by his negligence proximately caused his injuries and only if he proves fault and damages by a preponderance of the evidence in a trial before a court or jury.

Under no-fault, the public, the beneficiaries, and consumers of automobile insurance would get better protection for the premium dollars spent and at lower annual cost.

In addition, the hard-pressed judicial systems of the Federal and State governments would get some relief. The problems of the courts of America today are largely on the criminal docket rather than the civil docket side, but it is my judgment that no-fault, by lifting out of the courts a substantial volume of cases, would free up enough judge time, enough judicial man-hours to make it possible to try every criminal defendant in this country within 60 days from date of arrest, or at least within 6 months. It is by no means the complete answer to the crisis of our courts, but it is a part of the solution, and a part, incidentally, that does not require the expenditure of additional taxpayer money.

Finally, no-fault is a much more efficient system than the present one. The present one was not developed for a nation with 100 million registered motor vehicles and a multibillion dollar insurance industry; it was developed for a horse and carriage society, in another country, in another century, in the pre-liability-insurance era.

Since 1932 and the Columbia University study, it has been apparent to anyone who has studied the literature closely that something better than the automobile negligence liability-insurance system was available. The success of the Saskatchewan plan in one of the provinces of Canada confirmed this point.

However, for almost 40 years, the people of the United States were denied this "something better" because the individuals who feed off and earn their livelihood from the automobile negligence system happen also to possess a great deal of political clout.

They had, in fact, enough political muscle to snuff out the idea before it could even be tried in any State of the Union until the Commonwealth of Massachusetts in 1970 enacted a no-fault law. The Massachusetts statutes, however, came about as a result of rather unique circumstances which are unlikely to be duplicated in many other States: A very strong proponent in each political party; the highest premium rates in the Nation; a weak statewide organization of trial lawyers; and a State legislative tradition of being innovative.

Since there has never been any question as to my personal preference for no-fault, I confess that I did speak, my true feelings with some discreet friends. About a month ago, I received a telephone call from a congressional aide. He asked if I would testify before Congress on no-fault legislation. Apparently, one of my "discreet" friends hadn't been so discreet, and the congressional aide had learned that there was a lawyer who worked for the American Trial Lawyers Association, a trial lawyers' lawyer, who didn't agree with the party line.

I told him no because I wasn't myself convinced that automobile insurance was a proper subject for Federal rather than State legislation. I told him that I leaned toward the view that the States should be given every opportunity to act before the Federal Government comes in, in whole or in part.

Since that surprise telephone call, I have agonized and pondered.

Finally, after a recent meeting of key men in Chicago, I concluded that I had to testify. If Congress is to execute its duty, which is to all the people of the United States and not just to the trial lawyers, it should get the views of one who has studied and thought hard about this no-fault business for many years, and who has been a trial lawyers' lawyer.

In my judgment, the only way in which this Nation is going to get real justice, opportunity and environmental health is if the Congress and the State legislatures authorize the private and independent trial lawyers of America to become "private attorneys general" on behalf of private citizens and to authorize the trial lawyers to bring private-remedy actions for injunctions, court orders to perform, and damages against those who pollute, against those who discriminate, against those who rent substandard housing and against those who take advantage of consumers—in return for a reasonable attorney's fee and true costs, fixed by the court and paid by the defendant found by the courts to be in violation.

The fact is, therefore, that the enactment of the Hart-Magnuson legislation will not wipe out the trial bar for there are so many wrongs that need to be litigated and righted in our courts of justice. But the courts today are so chock-a-block full of existing business that they can't really take on big new workloads, even if class actions, treble-damage suits and all the rest were authorized in all the areas in which adequate enforcement of existing law is important.

The fact is, Mr. Chairman, that the trial lawyers of America, who should be out there litigating for America, a better America, are vegetating in the pork barrel of automobile negligence work.

The fact is that the only thing that will get the private and independent litigation experts en masse into environmental litigation, consumer protection litigation, inadequate housing litigation, antisnooping litigation and all the other things that lawyers can do in court which this country needs to have done is for the Congress of the United States to push them out of their present overstuffed and overpaid womb.

As I mentioned, until recently I leaned toward the position that, I now believe firmly that a decision to leave it to the States is, in fact, a State level before the Federal Government acts. I no longer do. I now believe firmly that a decision to leave it to the States is, in fact, a decision to retain the automobile negligence system with all its waste, all its excessive administrative costs, all its duplication, all its slow pace of operation.

If the Congress declines to act now, there will be some automobile insurance legislation passed by a few States in addition to my own. The legislation will even be called no-fault. But the terminology will be designed for one reason, to keep the Congress out. In reality, these State laws will continue the waste and the inefficiency of the present negligence liability-insurance system while ameliorating some of its bad effects.

Moreover, they will add the new problem which Gov. Francis Sargent of Massachusetts pointed to in a recent speech—the problem of excessive profits by the insurance industry. I have attached to this statement an article summarizing a recent speech on this subject by the Governor.

In Chicago on April 24th, I heard the ATL key men from Ohio and Illinois make such smug associations of control of their State legislatures, in whole or in part, that I was absolutely and totally disabused of my States-first leaning. I heard also that the trial lawyers have been increasing their power and their strength in State legislatures.

For example, the Texas Trial Lawyers Association has been running a program they call LIFT, under which subscribers contribute a minimum of \$10 a month to what amounts to a campaign fund for candidates for the legislature. More than 600 Texas trial lawyers now subscribe, according to what I learned at the Chicago meeting.

Every election year, the funds accumulated by LIFT are divided among protrial lawyer candidates for the Texas Legislature. Let me read the text of an item that was published in the June 23, 1970, issue of the El Paso, Texas Trial Lawyers Association newsletter, "Ready for the Plaintiff." (Vol. VI, No. 3) (The editor of the newsletter is attorney Richard T. Marshall, who was then national secretary of the American Trial Lawyers Association.)

#### UP, UP AND AWAY!!

LIFT is the latest effort of Texas Trial Lawyers Association. It stands for Lawyers Involved for Texas, and it's a runaway success . . . The *El Paso Times* reported in its Capital Column June 14th, that *LIFT* was responsible for the Democratic nomination in this year's primaries of six of the eight candidates it backed for the *State Senate*.

LIFT is a legislative kitty which is paying off. Most of your officers are contributing \$10 per month on a bank draft authority to LIFT.

If you want to be a part of the movement for *comparative negligence* in Texas, for statutory authority to let jurors know what they are doing in *special issue* verdicts, and for a successful rejection of *Keeton-O'Connell* schemes, in other words, if you want your practice to survive, better get with it.

Send a check, any amount, to LIFT, 201 Westgate Building, Austin!

A more complete description of LIFT, published in an ATL 1970 publication called "A Trial Lawyer's Legislative Workbook" and taken from a letter dated January 7, 1970, by Attorney William R. Edwards of Corpus Christi, Tex., to the vice chairman of ATL's legislative section with a copy to me as assistant to the chairman of the legislative section is attached to this statement.

It may be of interest to this committee to know that the Texas Trial Lawyers Association, which promotes LIFT as its "latest effort . . . a legislative kitty which is paying off" is itself a tax-exempt organization. I attach also from the Trial Lawyer's Workbook a copy of letters the Texas affiliate received from tax attorneys supporting their exempt status and advising them how to keep it.

What this means, of course, is that in at least one State the Federal Government, by tax preference, is subsidizing political opposition to the Keeton-O'Connell plan and other no-fault proposals, at the same time that Federal Government officials argue that the States can and will pass good no-fault laws.

Mr. Chairman, how many State senators or State representatives in Texas are going to vote for meaningful automobile insurance reform,

when they know that if they do attract candidates, good speakers, with money from LIFT and campaign help from the trial lawyers are going to run against them in the next primary or the next general election?

What real chance do the people of Texas have to receive the benefits of the no-fault system of automobile reparations—unless this Congress passes Federal no-fault legislation?

At the Key Men meeting on April 24, I heard that the LIFT program has been adopted by at least one additional State. According to Attorney Thomas A. Heffernan of Cleveland, Ohio—I believe his law partner, Mr. Craig Spangenberg, addressed this committee the other day—the Ohio Academy of Trial Lawyers is now enrolling subscribers to its version which bears the acronym ADOPT. This attorney predicted flatly, unequivocally, and totally that the Ohio Legislature will never enact any no-fault automobile insurance legislation in any form.

At that meeting, the chairman of ATL's legislative section, Attorney Jerry Finn of Newark, N.J., summed up the discussion by saying: "Let's all ADOPT LIFT." No one objected.

More direct fundraising methods are also used by trial-lawyer groups. According to Attorney Jon Carlson of Belleville, Ill., who spoke at the meeting, every member of the St. Clair, County, Ill., Bar Association has been assessed \$100 for a fund to fight Governor Ogilvie's insurance reform legislation.

Incidentally, Mr. Carlson and Attorney Leonard Ring of Chicago both asserted at this meeting that Ogilvie's bill doesn't have "a chance" to become law in Illinois. In Mr. Ring's words: "We control the Senate, Ogilvie controls the House; it's a standoff."

Mr. Chairman, again, what chance do the consumers of automobile insurance in Illinois have to secure the benefits of no-fault unless the Congress acts?

At another "key men" meeting, this one held for representatives from the northeast region, on April 17, in the offices of the American Trial Lawyers Association in Cambridge, Mass., several of the representatives suggested that defense lawyers, that is, personal injury lawyers who are retained by insurance companies to defend against automobile negligence claims, are a good source for funds to finance the fight against no-fault.

The key men were urged to form general anti-no-fault lawyers' groups and citizens' groups and resign themselves to the fact that defense lawyers were afraid to let their names be used since many of them are retained by insurance companies which are in favor of no-fault auto insurance. I believe it was Attorney Daniel H. Mahoney of Albany, N.Y., who mentioned that such a citizen's committee was functioning in New York State and had purchased newspaper advertising in several papers against the Gordon bill in the New York State Legislature (the Gordon bill is patterned after the Massachusetts law).

It was stated that the advertisements should become punchier. I notice the recent ones just say no-fault is a hoax.

Another Key Man, and a former Connecticut State legislator, Attorney Leon Riscassi of Hartford, mentioned that the Connecticut trial lawyers had also had good luck in raising funds from the sheriffs and constables of the State of Connecticut. Apparently, the deputies

are paid on a fee basis; they were convinced that no-fault would mean fewer legal papers to serve and, therefore, lower incomes for themselves.

The committee may also be interested in another method that has been used for more than 3 years to fight no-fault. Since late in 1967, the association has been arranging for large fees to be paid by one or another trial lawyer group to a supposedly neutral academic, Prof. David Sargent of Suffolk University Law School in Boston, in return for his speaking, appearing, and testifying before private and legislative groups all around the country.

I see no objection to the appearances or to his being paid—Dave Sargent is a very able law professor; he has a viewpoint, and the subject matter demands the most careful and complete discussion—but I do find it less than honorable that Professor Sargent appears wearing his Suffolk University hat rather than his trial lawyers mantle, and that his audiences are not told who is paying him or how much.

As a matter of fact, at one of the recent Key Men meetings, somebody was complaining that Professor Sargent's rates were going up. The delegates said that he is now asking \$500 an appearance plus expenses—for 1 day.

As the committee may know, this morning in Boston the supreme judicial court of Massachusetts heard oral argument in a suit challenging the constitutionality of the Massachusetts no-fault statute. The action has been brought by the immediate past president of the Massachusetts chapter of the American Trial Lawyers, Attorney Robert Cohen.

There was a short news item in the Boston Sunday Globe for April 25, 1971, page A-5, on one of the methods used to finance this constitutional-challenge litigation. According to the Globe's account:

Attorneys are wondering about a couple of ethical questions raised by the activities of the lawyers bringing the test case of no-fault auto insurance law. The lawyers, Robert Cohen and Alexander Cella, have sent other attorneys a mimeographed form offering for sale at \$50 per set the two-volume brief (\$45) they have prepared on the case and the appendices (\$5) . . . Fellow lawyers say (1) they've never heard of a lawyer openly selling a brief . . . and (2) the appendix consists of court records, which may not be theirs to sell.

To summarize and reiterate, it is my considered judgment that the trial lawyers will probably prevent any meaningful no-fault legislation from being enacted in any of the State legislatures, with a few possible exceptions. It is naive to argue that there is a choice between Federal legislation and legislation in the other 49 State capitals. The only choice is between Federal no-fault legislation or maintenance of the present negligence system, the system which the Department of Transportation's \$2 million study so carefully and painstakingly criticized.

There is, I might add, a second reason why I believe Congress must act. If the trial lawyers have a stronghold on the State legislatures, how does one find words to describe the power position of the insurance industry and its armies of lobbyists in all statehouses? There is at this time in my opinion absolutely no justification in experience or policy for the present exemption of the insurance industry from meaningful Federal regulation.

According to Attorney Heffernan of Cleveland, again, the trial lawyers have one lobbyist in the Ohio Legislature and the insurance

companies between them have 30. If the ATL people can make the assertions they make with their one lobbyist and ADOPT/LIFT, think what assertions the insurance companies can make in their private conclaves.

The objective of the insurance industry, according to the best information and intelligence the trial lawyers have been able to acquire, is maximum profit. Rest assured, there are enormous profit possibilities in no-fault automobile insurance unless it is tightly audited and regulated.

The reason for this is that a no-fault policy basically is a combined medical, accident-and-health and income-replacement policy which pays benefits in case of motor vehicle caused injury.

But the rates in Massachusetts, after the no-fault statute was passed, were not set on the basis of experience with accident and health and income replacement coverage, but rather on the basis of reductions from current automobile personal injury liability insurance rates. It is going to take a considerable number of reductions before one gets down to the accident and health premium level, and in the interim, rather enormous profit potential is available to the industry.

S. 945, the Uniform Motor Vehicle Insurance Act, represents new coverage by a new system. Since there are not now any Federal personal injury liability insurance rates, rates won't be set—they couldn't be set—by reductions from existing Federal rates. They will have to be set afresh from the new perspective, and that is what is appropriate when the subject is a new and different kind of coverage.

In my opinion, only the Federal Government has the strength and the capability to tightly audit and regulate no-fault automobile insurance coverage. If profits in excess of a reasonable return are to be prevented, no-fault must be legislated by the Federal Congress. Any other course would just mean the substitution of one form of consumer abuse with another.

I urge the passage of the Hart-Magnuson legislation.

Now, while this concludes my prepared statement, I would like to add a summary of what has happened since I mailed this statement to the Congress.

I was informed on Monday, April 26, after I mailed my statement to Washington, of the decisions reached at another trial lawyers' meeting in Chicago on April 24. At that meeting, the executive committee of the American Trial Lawyers Association unanimously approved a resolution creating a completely new department—the department of Federal-State relations—with a proposed budget of \$322,200 for the fiscal year which begins August 1.

The executive committee voted to finance the budget for this new department by (1) reducing the budget of the department of public affairs and education (which edits and publishes *Trial*) by \$112,000, and by (2) dues increases expected to net an additional \$200,000.

As part of the cutback in the public affairs and education department, its director was ordered to dismiss me, the only lawyer, at the end of the fiscal year, as well as several additional staff members.

In view of the statement I had mailed to Washington, I told the department head, the editor of *Trial*, that I would leave after the 2-week notice period which means I cease to be an employee tomorrow, May 7.

The director of the new department of Federal and State relations—a department incidentally which goes from nonexistence to being the largest department, consuming 25 percent of the association's total budget—the director will be Mr. Alan Locke. Mr. Locke is not a lawyer, but his brother, Barry Locke, is an aide to Secretary Volpe.

As part of that one-third-of-a-million-dollar budget, the association has contracted with a professional public relations firm to fight “no-fault”—the firm of Edelman & Co. of Chicago.

Thank you.

The CHAIRMAN. Thank you for your very potent statement.

I am going to have to leave in a minute, but I just want to point out that I, like yourself, in the beginning was hesitant about proceeding on the Federal level, thinking we could encourage States to get at this matter. I mentioned that sometime ago—3 or 4 years ago. But I have found from practical experience that it just doesn't seem to be moving.

Now inaction may result from some of the things you are talking about—I suppose they are factors—but even in my own State, and I am quite close to the legislature there, having served in it at one time, I find a lot of opposition to the concept of no-fault by legislators who I guess have never sought out to lawyers or insurance companies or anybody else. But when no-fault is proposed to them, then they will ask someone like an insurance man that they know of or a trial lawyer who just about convince them that no-fault isn't a good system. And there is no rebuttal. There is no chance for the premium payer or the consumer of automobile insurance to get their word in.

The result is there is just no action. I can conceive that, if we did something here that would allow the States to try and do something in a reasonable time, it would just not happen. We have run into that in all kinds of safety legislation. We tried to compel the States to have auto safety laws and it didn't happen until we passed a Federal bill. Sometimes, when we begin hearings on Federal legislation, it wakes some people up and they start to get busy. But when you are talking about 50 States, that isn't true; it is going to be a long, long time.

So, I am appreciative of your testimony, and being a lawyer myself I understand how they operate sometimes, although I am a little rusty at the practice of law now.

This is a very potent testimony because I think there are two things that plague every home in the United States. There are a lot of other things, but these are two things we know plague every home, financially, emotionally, and every other way. One is health insurance and the other is auto insurance. They affect every home, not only because of the money involved but because of the kinds of things that happen. When insurance companies are canceling contracts, when rates go up for insurance, people are afraid to go to the hospital or make an auto claim. They don't know if they can afford to take such action. And this is true in every home. I have said many times in the past 3 or 4 years that auto insurance and health insurance are two things that Congress ought to set itself to.

I am so glad that there is so much interest in this no-fault bill of Senator Hart's and myself, and we are hopeful to move along. And your testimony here is quite potent, and I appreciate it.

Now you will have to excuse me. I have to go down and discuss some maritime matters.

Senator HART (presiding). Mr. Joost, I think "potent" is an excellent word to describe your testimony, and I would think that it would move this legislation along.

Mr. Joost. I hope so.

Senator HART. It should. We will see if it will.

Now, I made so many notes as you went along that I don't know where to begin, but there are several points that I would like either to have you clarify or by a question, underscore.

Mr. Joost. Certainly.

Senator HART. Before I get to that, let me comment. On the very first page you describe your professional qualifications. I have met a magna cum laude man from Harvard law, and I have known Harvard Law Review editors. I am not sure if I ever met a magna cum laude graduate from Yale. I have met Phi Beta Kappas. But this is the first time I have met all of them at once. Do you understand my reluctance to ask you questions?

Frankly, I was tempted on other days in these hearings we have had witnesses speak against the bill to suggest the high level of self-interest which inevitably would operate on their judgment. I didn't. You are pretty blunt about it. I guess the reason I didn't is my belief—my hope—that in the legislative considerations of these proposals, intelligent men will be able to evaluate the background from which on any of these witnesses speak. It was not that I was unconscious.

Mr. Joost. I hope your claim has merit.

Senator HART. Here is one I will have to ask you to clarify. We opened these hearings with Secretary Volpe as the witness, and I haven't reread the testimony—maybe my memory is faulty—I thought he was one of the great fighters for the Massachusetts no-fault plan. I get the impression that he knows the fight: you can wait for the States and give them a try. Your vision of his role is sharply different from my impression.

Is my impression wrong?

Mr. Joost. Your impression is wrong, sir.

As you know, Massachusetts has had a compulsory-automobile-liability-insurance law since 1927. There have been problems under this law, including the fact that it helped to put Massachusetts in the untenable position of being the State with the highest auto-insurance premiums in the country. In 1966 or 1967, shortly after John Volpe's election to the first 4-year term as Governor of Massachusetts, shortly after that election, the Governor filed legislation to end the compulsory-liability-insurance system and enact a financial-responsibility law and also to establish a fraudulent-claims bureau.

Now, financial-responsibility laws exist in 47 of the 50 States. Only three States, Massachusetts, New York and North Carolina, have compulsory automobile-insurance laws. Financial-responsibility laws are a little like the dog-bite laws; you may get the "first bite" free, but after that you have to have liability insurance.

Governor Volpe pushed for "financial responsibility," even though it has never really worked, because "financial responsibility" means there will always be some totally uncompensated victims. If you get hit by an automobile, and if the person who hits you doesn't have liability insurance or private wealth or substantial property subject

to attachment, "financial responsibility" means you are totally without protection in case of injury.

I have heard of cases in States with financial-responsibility laws where hospitals wouldn't even admit an automobile accident victim until they received proof that either he had a Blue Cross certificate or that the person who hit him was insured or highly solvent.

Despite all this, Governor Volpe introduced a financial-responsibility bill. Mike Dukakis, who was a classmate of mine at Harvard Law School and a very active Democratic Member of the House of Representatives, decided that the Democrats had to come up with an insurance program also. He decided that it should be a real reform program, and thus he filed the "no-fault" legislation that had been drawn by Professor Keeton at Harvard.

Governor Volpe did not support him. Mike got it through the House of Representatives on a hot summer day when there weren't too many people there; he moved substitution on the floor, and the Keeton-O'Connell plan passed. Lo and behold, the trial lawyers panicked. There was an emergency return of employees on vacation. All kinds of things happened. People scurried all over the place.

Finally, there was a day of great jubilation when somebody persuaded the head of the Teamsters Union in Massachusetts, I think his name was Nick Morrissey, to agree to run full-page ads by the Teamsters opposing no-fault, provided the trial lawyers would pay for them all. With this kind of support, "no fault" was killed in the State senate.

Governor Volpe never made a statement in support of "no fault." He never had to act, of course, since the bill was prevented from coming to his desk as Governor. The same thing happened again in 1968. Governor Volpe never endorsed the concept while he was Governor.

Senator HART. My question might appear to be critical of the Secretary. I was asking for clarification. I react this way. Sort of the Biblical welcome-home thing. If in fact once he was opposed or not helpful, he now has moved to the point of urging the adoption of no-fault across the country, but says—and I sense rather reluctantly—that we ought to wait, you know, pass a resolution and encourage the States to do it. In any event he does, you will be glad to know, support no-fault.

Mr. Joost. I think one reason for his support now is the fact that his Lieutenant Governor, now Governor, Francis Sargent, has found that the "no-fault" thing works. You know, there is nothing like trying something—try it and see if it works. The Massachusetts law is really not a very good law technically. I have drafted a lot of statutes for the criminal law commission, and believe me, the Massachusetts no-fault law is technically very poor.

The first sentence is 567 words long. The second sentence is 140 words. The guts of the statute are contained in a definitions section; the definition of PIP, personal injury protection. With all, it is a weak and limited bill, but the important thing is that it is working. The premium rates are coming down, although they have got to come down much more.

Senator HART. Governor Sargent filed a statement with us yesterday complaining about the failure of the Massachusetts plan to reflect the savings that were accruing to the insurance carriers.

I won't ask you to describe in fuller detail how your vacation was interrupted, but I am intrigued by the passing comment that you made about it.

Do you know whether the Internal Revenue Service has reviewed any of these programs or war chests, or whatever you want to call them, specifically the one in Texas?

Mr. Joost. I just don't know. The letter from tax counsel which I attach to this statement states the facts—in other words, you have told us thus and so. The LIFT program is not in that statement of facts. So I can't blame tax counsel. I have no way of knowing what Internal Revenue has or has not done.

Senator HART. Some place in here you describe a county bar association assessing a sum.

Mr. Joost. \$100.

Senator HART. That was on each member to generate moneys to fight the Ogilvie plan in Illinois County? Could they fog that up in such a fashion as to make it a deductible business expense?

Mr. Joost. Again, I am not a tax lawyer, and I think I had better stay out of that can of worms.

Senator HART. The group which files and obtains a tax exempt status nonetheless may not use moneys in legislative lobbying unless it wants to forfeit its exemption. I am not a tax lawyer either, but isn't that a correct statement?

Mr. Joost. That is correct. I think the reasons for it are terribly important public-policy reasons. We cannot permit special-interest groups, particularly special-interest economic groups, to be both tax exempt and free to lobby. When you come right down to it the bar associations, at least the American Trial Lawyers Association, is nothing more, nothing less than a trade association. If groups like this are subsidized by the Federal Government to pursue lobbying and legislative activities aimed, not at the best interest of the Federal Government or the best interest of the people, but at their own personal best interest, their own personal pocketbook interest, then the public is deceived.

The trial lawyers speak in terms of "offensive" legislative activity, which means persuading States to enact new provisions such as comparative negligence as a replacement to the rule of contributory negligence, and "defensive" legislative activity, which means preventing the passage of "things we can't live with"—preeminently no-fault auto insurance.

I think the reasons why Congress continually has said, in all its revision of the Federal Tax Code, that you can't be both tax exempt and lobby, are good. There are particular situations, I know, where the prohibition hurts, but I think the reasons in favor are overwhelming and clear. Personally, I think that the tax law on exemptions for trade associations and such groups should be tightened.

Senator HART. The fact that you have advised us with respect to the activities which you, as a result of sitting with the "Key Men" meetings, know are included in the agenda of these groups would, I think, put the Internal Revenue Service on notice. I am not suggesting that it is or isn't an abuse, I don't know. But certainly you have raised the question. As you say, it is a basic public policy concern that that kind of activity not be subsidized.

Incidentally, you describe the political muscle of the trial lawyers' groups in the States. With the little experience I had at Lansing, which is the State Capitol of Michigan, I would think that opposition to no-fault in consequence is getting more political muscle when they enlist the sheriffs and constables as alluded to in your testimony. As for this business of the professor at Suffolk testifying, speaking, and drawing fees from the association; this practice probably will be with us as long as we have this kind of society, I suppose. I don't know how you can get a hand-hold on that. The politicians should be most conscious of the glasshouses in which they dwell before criticizing someone else. We do it in reverse, or some do. Some lecture to groups and they are then compensated. I am always struck by the fact that the group to which the politician is lecturing knows infinitely more about the subject matter than the politician, but the group pays him.

Mr. Joost. That is not always true. The thing that disturbs me personally about the university situation is that the scholar, the teacher, does hold himself out to his students, if to no one else, as a certain sort of person. We have been having a certain amount of trouble in our universities because not all students believe all faculty members are in that position. But I would like to believe, myself, that those who choose to work in academia, who choose to become professors, will in fact pursue the truth in the old Socratic manner.

All the law schools say they have the Socratic method of teaching. The goal of Socrates' method at least as I recall it from my limited memory of philosophy courses, was the pursuit of truth. I don't think you can pursue truth and at the same time accept stipends, which you do not disclose, from groups who frankly do not care about the argument so long as they get the desired results.

Senator HART. Perhaps disclosure for academics is what we should recommend just as we recommend disclosure for the political lecturer.

Mr. Joost. I think you find academics recommend disclosure for politicians much more than they recommend it for themselves.

Senator HART. Drawing on your background, in the course of our hearings, questions have been raised about the basic constitutionality of the Hart-Magnuson proposal and more acutely about State no-fault legislation.

Now, first, on the question of the Massachusetts no-fault law, what is your opinion with respect to its constitutionality?

Mr. Joost. Well, obviously, I cannot outguess the Supreme Judicial Court of Massachusetts, but my feeling is it may in fact—a key part of it may in fact—be held unconstitutional on the grounds that it is an arbitrary, capricious classification.

Now, the Massachusetts law works on what may be called the threshold concept. If you have \$500 of medical and hospital bills, and they are reasonable, then you can get a tort lawyer, go to court, get a jury trial, and you are entitled to and can recover a verdict that includes general damages for intangible losses—pain, suffering, inconvenience, emotional hurt, and all the rest.

But, if your medical bills are less than \$500—there is a whole list of things, prosthetic devices, ambulance charges, and so forth that are includible—if they are less than \$500 you cannot get general damages; you cannot recover for pain and suffering; you cannot get a jury trial.

The Supreme Court of the United States in a line of cases—I don't have the citations here—has spoken of the necessity for reasonable classifications, reasonable categories which bear some logical relationship to the subject matter. Now, I think it is possible that the SJC of Massachusetts will conclude that this \$500 business is an unreasonable classification. It has no relation to what kind of an automobile accident it is or what the injuries are, it has no relation to any of the findings of the DOT studies; nobody says that \$500 is the magic cutoff between serious and trivial accidents. I don't know where the threshold cutoff came from in the legislative hurly-burly on this law but it came and the number picked was \$500.

I think it is quite possible that this could be called arbitrary. If it is arbitrary and capricious, the provision could be wiped out as unconstitutional. I would like to contrast this \$500 clause with the related provision in your own bill, Senator Hart. In section 4, your bill says that you can recover general damages in a tort suit if there is a "catastrophic harm," as defined. Now catastrophic harm strikes me as being a very reasonable category. We can distinguish rationally between catastrophic harm, which is defined, and all the rest, which is noncatastrophic harm. That is reasonable classification. I think it fits what was meant by the great justices who have declared that due process means a "scheme of ordered liberty," "the American scheme of justice." Due process requires reasonable classifications, not cutoffs plucked out of thin air. Otherwise, there is a denial of equal protection. Catastrophic harm is a very good dividing point, and certainly it is within the legislative province to define it.

As to the Hart-Magnuson bill itself, I see no constitutional problems. If anything is clear from the original documents on the founding of this Republic, the one power that everyone agreed should go to the Federal Government was the power to regulate interstate commerce. I think that automobiles today—automobile driving today—is the single biggest kind of interstate commerce we have.

Now, the members of the Constitutional Convention of 1789 didn't say everything that was interstate had to be regulated by Congress. But I think it was their understanding that the important things should be centrally regulated if this was to be a viable Federal Union. I believe that automobile driving is so interstate today that all its aspects—the manufacture in terms of safety and environmental controls, the compensation of the people injured, the insurance against losses caused—all belong under Federal regulation. It is preeminently, not marginally, interstate commerce.

The Federal Government regulates many things. There are also a lot of Federal criminal statutes that use the interstate commerce power as a threshold, a kickoff to establish Federal jurisdiction. Automobile operation involves much more interstate commerce than many of these things now governed by Federal law.

There is a real practical necessity for uniform automobile compensation law. If there were 50 different State laws on auto insurance, there would be tremendous confusion. I think the insurance companies would find that even their computers would get tired figuring exactly how the system works in each State and what the applicable law is.

So it is clearly interstate commerce. The subject is clearly within the competence of the Congress. It is clear under the necessary and

proper clause that when the Congress enters an area which is within its constitutional authority, it may legislate as its wisdom and discretion dictate.

The argument has been raised that the Hart-Magnuson bill violates the seventh amendment with respect to jury trial. I do not believe that argument has merit. The Supreme Court, over the years, has rather carefully, and I think rather deliberately, refrained from including the seventh amendment right to civil jury in any of the dicta discussing or defining what is meant by due process.

Senator HART. I have not heard it developed really to the end of a paragraph, but I sense some concern, perhaps among some Members of the Congress, that goes this way: Can we legislate, wipe out what they would describe as everybody's right to proceed in a tort case to establish and recover for any hurt? It isn't voiced quite that way, but I think that it is out of that question that comes their wonder about the reach of a bill such as this. In other words, I guess they would say what you are doing is by a Federal act washing out an individual's States rights to use a State court system to recover for whatever he can establish was wrongfully caused.

Mr. Joost. There are precedents for this. I have taught at the New England School of Law; I taught labor law. I think labor law is a prime example of an area in which the States and the State courts had major authority. The States defined and enforced the rights of management and of labor, of owners and of strikes. But then came Federal acts—the Norris-LaGuardia Act and the Wagner Act in the 1930's, as amended by the Taft-Hartley Act, as amended by the Landrum-Griffin Act—and no longer was a factory owner able to use his State court system to enforce "yellow dog" contracts or convict strikers or enjoin union activity.

Prior to the 1930's, the Federal Government had no great involvement in labor matters. But the U.S. Supreme Court upheld the National Labor Relations Act in the 1930's, when its constitutionality was challenged on the ground that Congress could not take these powers from the States. The Court sustained the Wagner Act because it clearly involved the regulating of interstate commerce.

The rationale for a Federal Union demands that there be a customs union, a "common market" to stimulate the commercial intercourse which is necessary so that every component can benefit to the greatest possible extent. There has to be central regulation of the things that are really central. I would argue that transportation matters such as automobiles and the driving of automobiles must, like labor matters, be regulated by the central authority. I think this is what the founders had in mind when they gave Congress the power "to regulate commerce \* \* \* among the several States."

Senator HART. You said in your prepared testimony that there were many rewarding jobs open to the trial lawyers of this country—exciting jobs. What has happened to the trial bar in Massachusetts now that they are operating under this no-fault program there? Have they gone to the environmental protection field or are they still busy with insurance law?

Mr. Joost. Well, just yesterday I heard on the news that the Massachusetts State Senate had given final approval to a bill to permit private citizens to sue those who are alleged to cause damage to the environment.

I believe that it is a better bill than the one that Michigan passed last year on the same subject. It has also passed the House and it has gone to a conference committee. According to the radio broadcast, the Associated Industries of Massachusetts are preparing a last ditch effort to defeat this bill which would permit individual citizens to sue to enforce the pollution—control statutes and regulations which are already law, but we believe that it will survive the conference committee and Governor Francis Sargent has indicated he personally believes private-remedy suits represent a very important approach to environmental protection.

Congress last year passed a provision authorizing "Citizens Suits" as one of the amendments to the Clean Air Act. The Federal law provides for reasonable attorney's fees to be paid by violators. This is proper—I think the lawyer should receive a fair compensation for what he does—but that is very different from the frequently exorbitant fees earned in the automobile—negligence business.

Senator HART. The Ogilvie bill in Illinois, is it a Massachusetts no-fault bill?

Mr. Joost. No, it is not. It is a different kind.

I would say, first, it is a misnomer to call the Ogilvie bill a no-fault bill. In fact, a headline in the *Wall Street Journal* declared that the "Ogilvie System Would Bypass No-Fault Concept."

"Others have agreed" that the Ogilvie bill is a no-fault system and one which, if enacted, will make it—unnecessary for the Congress to act.

When you break it down and look at the Ogilvie bill, you see that it is really not a system, it is not a plan. As a result of my work with statutory recodification and revision efforts, I very much believe that the legislative bodies should not try to copy the courts and decide things on a case-by-case basis, a little thing here and a little thing there. Rather, they should try to create systems that make sense and leave it to the courts to fill in the bits and pieces. The Ogilvie plan is not such a system. It is a hodgepodge collection of 13 different bills on different points. The 13 bills don't add up to a system, no-fault or otherwise.

In substance, the Ogilvie bills involve a scaling down, a reduction of the amount of money that would be paid by insurers to motor vehicle accident victims who bring tort suits. That reduction in payout makes two things possible: A reduction in auto insurance premiums which looks good, and a package of first-party-benefits. The first-party-benefits package would pay a maximum of \$2,000 per victim in medical, hospital, and funeral benefits plus a maximum of 52 weeks of wage loss up to \$150 a week in income continuation benefits.

What this amounts to is adding some no-fault frosting onto the same old negligence cake. The cake itself won't be changed except to scale it down in size.

The most important section of the bill is the section called "General Damages." It states that damages for pain, suffering, mental anguish, and inconvenience shall not exceed the total of a sum equal to 50 percent of the reasonable medical treatment expenses \* \* \* if \* \* \* the total of such \* \* \* expenses is \$500 or less, and a sum equal to the amount of such reasonable expenses, if any, in excess of \$500."

What this bill does is to say, sure, you can have a jury trial and you can get general damages for pain and suffering, but the jury cannot

find as a fact that your general damages are worth any more than your medical expenses if your medical expenses are over \$500, and the jury can't find—they will be in reversible error if they do—that your pain and suffering is worth more than 50 percent of your medical bills if they are less than \$500.

Now, I think this restriction represents unwise tampering with the jury. I think that if you give the right to trial by jury in a negligence case, you must really give the plaintiff that right.

The Ogilvie plan keeps the automobile jury, but puts it into a straightjacket so far as damages is concerned. Let's assume the plaintiff is a violinist and something happens to his hand; in the auto accident he breaks a finger, it is put in a cast, the total medical bill is \$200. However, for an entire season he cannot play with the Chicago Symphony Orchestra. What Governor Ogilvie is saying is that this particular violinist's pain and suffering and inconvenience for not being able to play with the Chicago Symphony for an entire season shall not exceed \$150. This bill is doing something that makes me very uncomfortable; you give or retain a right, you "press-release" it as a right, but you take away its substance.

There is another provision in the Ogilvie package that I would like to take the time to comment on. The section is called "Fraudulent Claims," and it is a substantive criminal law, not an insurance law. Just looking at it technically—and for 3 years I have been drafting and analyzing criminal statutes—this is a bad bill.

The criminal law can take on just so much. It is a little bit like the Great Lakes; it looks enormous, but in fact you can dump only a certain amount of indigestible material into it; dump too much and it ceases to live.

Now, what the provision says is that:

Any person who . . . indirectly . . . acts in concert with a person seeking to falsely and fraudulently represent . . . or exaggerate the nature and extent of motor-vehicle-caused injury or damage to property shall, if the sum so obtained or attempted to be obtained is less than \$100, be sentenced to not more than one-year imprisonment, or if the sum exceeds \$100, shall be imprisoned not more than 10 years.

Now, this is silly. First of all, there is no sure method of obeying it. All that is necessary for a criminal conviction is to prove the defendant acted in concert with someone who was trying to exaggerate a claim. You don't have to do it intentionally, you don't have to do it knowingly or recklessly or negligently; it is enough that it happens.

You can imagine the lawyer, whose client never tells him honestly what happened, who puts on evidence which in fact exaggerates by \$101 the extent of the client's injury.

That attorney could go to jail for 10 years.

Now, I think this is foolish. All that the section is going to do is to make lawyers reluctant to talk to their clients lest they be accused of acting "in concert" with one who exaggerates; it will thus have a "chilling effect" on the attorney-client relationship; as a practical matter it will not work. People are not going to be prosecuted for this, not in the present state of the criminal courts. The fraudulent claims bit—in so many cases it is not fraud—it is rather something which is built right into the negligence/liability insurance system. Assume you are paying \$300 a year in auto-insurance premiums, and

you don't have an accident for 10 years, and then something happens. You know how you paid in \$3,000 and you know it is so much that I think that you really do feel a pain in your head.

Mr. SUTCLIFFE. In discussions with Mr. Markus and the trial lawyers yesterday the subject of the Federal-State fund was raised. It was explained to us that that fund would be used to create liaison with Congress in order to facilitate our efforts in considering legislation. You have now told us that you, an expert, as demonstrated in these hearings, have been relieved of your position with the trial lawyers. Can you tell us who will be talking to Congress to help us in our reform of the automobile compensation system?

Mr. JOOST. I think I mentioned that the head of this department will be a nonlawyer, Mr. Alan Locke, whose brother I believe is press secretary to the Department of Transportation, and he will have at his command a Washington representative, Mr. Wayne Smith, who is also not a lawyer, and the services of Edelman & Co., a public relations firm in Chicago, with a New York branch, which will handle the account from a Hartford office.

So I think the help that the Congress will be getting—well, you can weigh yourself what contribution such a group of experts will make to the solution of the problem.

Mr. SUTCLIFFE. One more comment that is taken from yesterday's hearing transcript. This is a response of Mr. Markus to questions about LIFT and ADOPT. He said:

I might say the items you are describing, frankly I wish they were stronger and more effective. These items represent a very minuscule percentage of the amount the insurance industry is now spending in this area. We have reason to believe it is many millions of dollars.

From your vantage point, does that seem to be an accurate statement?

Mr. JOOST. I will have to answer "Yes," "No," and "I don't know." I do not know what the total figures are, either for LIFT or "for the insurance industry, but I do know that the LIFT ideas is on a curve of rising expectations. The State chapters and affiliates will be stimulated by this well-financed Department of Federal-State Relations which will send people around to show the local groups "how to do it," how to act effectively politically. LIFT and ADOPT programs—every State will have its own acronym—will probably be started in a majority of the States within a very short period of time.

Perhaps I overstressed the financial aspect of LIFT, the fact that it was called "a legislative kitty which is paying off." I do not think that money is the sole source of political and lobbying strength. The real strength comes from the fact that the trial lawyer has many skills, skills which can also make him an attractive political candidate or an effective campaign manager. He is accustomed to speaking. He is accustomed to responding to questions. He is not afraid to appear in public. He is accustomed to hostile questioning. He knows how to get information. He has a lot of friends and a lot of contacts. If he has been an able lawyer for 10 years or so, he knows an awful lot of people who think he is pretty good. If he goes in with this expertise and this ability and really takes to the stump to support and help a candidate with speeches and letters and phone calls, telling people what a great guy "Honest" Joe Doakes is, then Joe Doakes has a lot going for him beyond the, say, \$10,000 campaign contribution from LIFT.

You have to bear in mind that campaigns for State legislatures are much less expensive than campaigns for Congress. It does not take that much money. Millions of dollars could easily be wasted by insurance companies while tens of thousands precisely placed by trial lawyers on a particular race could mean veto-power control over a particular State legislature. The important thing is not just how much money a political fund raises and spends; it is also the way in which the money is placed, the way in which it is spent, that counts. For this reason, any comparison of lobbying expenditures between lawyers and insurance companies is of limited value.

Again, this is a very subtle way, and I think, therefore, a very effective way to influence legislation. You do not go after legislation; you go at the person who has a right to vote on legislation, namely, the person who sits in the State legislature. If a legislator votes "wrong," you find a strong opponent, the most attractive person in the district who will run, you fund him, you back him up, you have people prepare programs for him, literature for him, professionally advise him. Thus supported, he is going to have a good chance to defeat the "bad" legislator.

So I am not surprised at these 1970 results in Texas, that out of eight candidates backed in the Democratic primary for the State senate, six won. LIFT's first year, 1970, was their dry run. They can probably get a higher percentage than six out of eight in the future, but even 0.750 is a pretty good batting average.

Again, you see why it is difficult to answer your question.

Mr. SUTCLIFFE. I recognize that and appreciate your response.

The committee would like to draw for a moment, if you will permit us, upon your technical knowledge of the Massachusetts plan. You have mentioned the Illinois plan with the first-party overlay over the existing tort system. In Massachusetts they ostensibly have a first-party coverage for tangible losses as between the policyholder and his insurance company, but in that plan they created a subrogation-like arrangement so that the insurance companies of the policyholders have to get together to determine which of their policyholders was at fault. Then through arbitration the company whose policyholder is found to be at fault reimburses the other company for the amount of his first-party payments to his own policyholder as well as its claims cost.

Mr. Joost. It is something like that. I think they have a 400-word sentence.

Mr. SUTCLIFFE. I hope I got by with a 200-word explanation. What impact will this procedure have on the efficiency of the no-fault system in Massachusetts, and if you will, address yourself to what kind of inconvenience it will create for the consumer who has to have his insurance company talk to him pretty thoroughly about the accident and maybe even have his insurance company ask to come before an arbiter to explain what happened?

Mr. Joost. If this is in fact what is finally held to be the meaning of the Massachusetts statute, it will be yet another way in which consumers lose out. I have the laws here—Acts of 1970, chapter 670 and chapter 744. I pasted the two statutes together to determine what the law really says, but that doesn't help with internal questions. It is really very hard to know exactly what the Massachusetts no-fault

law means on many points. It has, conservatively, about 30 ambiguities, one thing in one sentence, another thing in another section.

To give you an example, there is a merit-rating provision. If you are claims-free for a year, you are entitled to a 2-percent discount on your insurance premium. But no one knows whether the discount is 2 percent per year cumulatively, intermittently, or totally. If you go 3 years without an accident, file a claim in the fourth year, and then you are accident-free in the fifth, and sixth years, do you then get a 10-percent reduction, a 4-percent reduction or a 2-percent reduction?

There are so many ambiguities and technicalities, that frankly I am not prepared to comment on the retention of subrogation, except to say that I believe your summary is accurate.

Mr. SUTCLIFFE. Do you know why it was done? What is the rationale for this kind of an arrangement?

Let me read one thing and see if you might concur in it. This is in the Massachusetts Association of Independent Insurance Agents and Brokers' booklet entitled "Special Report on Massachusetts Auto Insurance."

On page 13 they talk about what they entitle the "Inter-Insurer Subrogation." They conclude: "In practical effect this means that the liability exposure of companies remains essentially as good or as bad as it was before."

Is this provision included in there only to allow those companies who have all the good risks right now to keep them and to benefit from them?

Mr. Joosr. I think it is clear that subrogation between insurance companies is completely contrary to the theory of no-fault. Basically, the theory of no-fault insurance is that we let the loss stay where it falls but reimburse the victim for that loss from the insurance pool to which he and all other motorists have contributed. To subrogate on a case-by-case basis, to shift money back and forth between insurance companies on the basis of which company's policyholder was at fault, whether it is done by arbitrators or whether it is done by a court, involves a waste of time, a waste of people, a waste of money for hearings, for preparation, for salaries. The cost of waste is eventually paid for by the consumer in the form of higher-than-necessary premiums.

In most cases, the claims of A company vs. B balance out against the claims of B company vs. A in a rather constant ratio. If the law permits this back-to-forth subrogation, then the administrative costs of the system will be excessive. If the law permits this back-and-forth subrogation, then the administrative costs of the system will be excessive. If that agent's association brochure states that this is the Massachusetts law, it probably is, because the genesis of our no-fault law was a bill, I think it was S. 500, that was filed on behalf of the Massachusetts Agents and Brokers Association.

That original bill was changed enormously. Already two parts of the law have been held unconstitutional by the Supreme Judicial Court of Massachusetts. The trial lawyers' strategy was to make the bill into a Christmas tree when they saw that the votes were there in 1970 to pass no-fault—to put on so many goodies that the whole thing would fall because the Governor would be compelled to veto it because otherwise the insurance companies would yell too much.

They put in a provision that there should be a 15-percent rate reduction, not only for personal-injury policies but also for property liability and collision-insurance policies. There were other things that were put in also. Notwithstanding, the Governor in fact signed the final product. The legislature then amended some of the extras, and in November our Supreme Judicial Court voided the unrelated rate reductions. The insurance companies did in fact yell that they would no longer do business in Massachusetts, but they are all still there and doing handsomely.

There will have to be a great many appellate decisions in Massachusetts to finally determine all the parts of this law. In that context, I would like to command all the people who had anything to do with the drafting of S. 945. I think it is a very well-written bill. It is even better than the one that Senator Hart filed last year. Technically, there are fewer ambiguities. As a matter of fact, I talked with a personal friend just a couple of days before I came down here, a professor at Yale who has written a book on the subject, "The Costs of Accidents," and he says it is the best-written no-fault bill that he has seen filed anywhere this year.

Perhaps I overstress the importance of the draftsmanship, but when so many people are going to have to use a law, live with a law, operate under it, the language should be comprehensible to the layman. The law is not just for the lawyers, it is not our private property. It should not be expressed in archaic or arcane terminology, difficult for the layman to follow. If it applies to all, be it the criminal law or the automobile law, it should be comprehensible by all.

I think your proposed statute, while it could be improved some more, I think it is really very good.

Mr. SUTCLIFFE. That is all the questions I have. Thank you.

Senator HART. Thank you for the last comment which I can take with good grace because, as you suspect, the Members of the Senate rarely do the drafting, and I certainly had nothing to do with what you said was a good product, but I am delighted that you said what you did, because it will permit me to go to those who did draft it and indicate your judgment on the quality of it.

One last question because I have it thrown at me by some of my colleagues; and it is not the result of a trial lawyer lobbying my colleagues. It is just their preliminary reaction to this proposal. In short, they say I know we have got to do something about automobile insurance; I am for you; except you have gone too far. I do not want to have to pay to fix up some bum that drives with inexcusable carelessness. Can't you take care of that problem for me? That is the end of the question. How do you respond to that?

Mr. JOOST. Speaking personally, regardless of philosophy, I am afraid you are going to have to pay to take care of that inexcusable bum. The only question is how. We might, for example, have to pay for him or his dependents through welfare. We must face the fact that we pay because that man—that really bad driver, drunken driver—is more than a bum on the highway. That is only one part of him. He may also be a skilled craftsman in a machine-tool company. When he is all banged up and does not get rehabilitation and does not get good medical service and cannot come back to work for a long time, the Nation—not just the company—is deprived of his economic input into

the total goods and services of this Nation. We are paying, we do pay, every time someone is really hurt in an accident. The only question is how—out of general revenues or an automobile insurance pool into which the “bum” pays premiums which cover the risk?

I think the most commendable feature of your legislation—whether you did this consciously or not—is that you accept the fact that we are paying and say how do we best get auto victims back in business. I think that by giving the victim basically unlimited medical benefits plus unlimited rehabilitation benefits plus compensation for loss of earnings for a period up to  $2\frac{1}{2}$  years, you do everything that reasonable men can do to get that automobile victim back in business, be he a student or a housewife or a production worker or an architect or what have you. In my judgment, this emphasis-on-the-future is much more important; much more just; much more compelling than anything trial lawyers may say about the importance of pain and suffering and the dignity of a jury trial.

I think the Supreme Court will consider the seventh amendment argument in light of that essential justice and compassion. The bill's purpose is so terribly important that the Congress should act without delay.

Senator HART. Thank you.

Let me make one last comment. Normally when this comment is made it reflects a feeling that because of some act of individual courage and sensitive conscience somebody has put himself into the army of the unemployed by coming in here and testifying. With your extraordinary talents there would never be the danger that your services would not be sought. So I know that when you decided, as you put it here, “finally I concluded I had to accept the call to testify,” that you did not face economic deprivation from the decision, but that really is not the most difficult part of stepping up and speaking hard truths. Lots of people who are the beneficiaries of enormous trust income never speak.

The fact that you would come as you have to as one who has been a trial lawyers' lawyer and told us that no-fault is the answer is an act, I think, of considerable courage, and I am sure that Senator Magnuson, had he been able to stay, would have joined me in that expression.

Mr. Joost. Thank you, sir.

#### PORTIA LAW JOURNAL

**Basic Protection for the Traffic Victim—A Blueprint for Reforming Automobile Insurance.** By Robert E. Keeton<sup>1</sup> and Jeffrey O'Connell.<sup>2</sup> Boston, Toronto: Little, Brown and Company. 1965. Pp. xv, 624. \$13.50.

A brief review can scarcely do justice to the complexity, intricacy, and thousands of hours of research, thought, analysis, discussion, and consultation that lie behind this ingenious and creative work. It is a pathfinder in a difficult area. Whether the proposed new basic automobile insurance system, based essentially upon strict rather than negligence liability, *should* be adopted is a question that lies within the responsibility and expertise of the legislatures. Clearly, however, each state legislature and even the Congress (what is more inter-state

<sup>1</sup> Professor of Law, Harvard Law School.

<sup>2</sup> Professor of Law, University of Illinois Law School.

commerce these days than automobile driving?) should study carefully this proposed reform and the justifications advanced for it.

The authors state that five major shortcomings affect the present system of compensation for automobile accidents in each of the states: (1) many injured persons receive no compensation and others receive less than their economic losses because the other driver hasn't enough insurance or assets, or because the victim must show the other person was at fault and he was legally blameless. Proof, at times is hard to get, *e.g.* if the accident was hit-and-run; (2) the present system is extraordinarily slow and cumbersome, what with delay in the courts, and the impecunious victim, with his back against the wall financially, may settle for less than his just deserts; (3) there is too much unfairness, as a practical matter, with some people getting more than they deserve and others less; (4) the fault system is extraordinarily expensive to administer and this heavy administrative cost is added to the premium bill each car owner pays; (5) the present system is a constant temptation to dishonesty—"inducements to exaggeration and invention strike at the integrity of driver and injured alike, all too often corrupting both and leaving the latter twice a victim—injured and debased." Substantial documentation is advanced to support each of these assertions.

The basic corrective advanced is absolute basic compulsory automobile insurance. Under such a system, *anytime* a driver is in an accident *his own insurance company* shall compensate him or his guest, for their "loss," which shall not include pain, suffering and inconvenience. Benefits would be paid monthly as the loss accrues. Tort liability would remain, but only in major cases (where damage for pain and suffering exceeds \$5,000 and other tort damages exceed \$10,000).

The proposed statute is a careful attempt at reform. If substantially enacted, it would provide a fairer and more sensible solution to the grave national problem of compensating automobile accident victims.

One question that arises, however, that the authors do not consider, is whether one can ever truly compensate an automobile accident victim in *dollars*; *e.g.* a man who loses his legs or a child who no longer has a father? No one has said that *all* auto injuries and deaths can be eliminated, but many have suggested that if automobiles were designed with safety rather than sex-appeal as the first order of business, the staggering highway toll would be reduced. The most "Basic Protection for the Traffic Victim" would seem to be that the government do everything possible to protect a man from ever becoming a traffic victim in the first place, through enforcing higher standards for driver skill and demanding a tank-like' approach to auto design.

#### LETTERS TO THE EDITOR

#### KEEP THE COMPULSORY

... With all due respect to the governor of the commonwealth, the leader in Massachusetts of the party which I personally support, the financial responsibility law idea is an irresponsible "solution" to the problem of automobile insurance. Compulsory insurance must be retained. But the rates must also be cut significantly. The Dukakis bill is based upon the results of long and painstaking research by a group under two highly regarded professors of law and tort law authorities. The Dukakis/Keeton-O'Connell plan will not eliminate the right to trial by jury, as some responsible lawyers unfamiliar with the details seem to be afraid. Insurance companies will not lose money, nor will the plaintiff's personal injury lawyer, whose livelihood rests on a contingent fee, suffer unduly.

The political parties and their representatives in the Legislature and executive, and the members of the bar who are all "officers of the court" have a responsibility to the people and to the commonwealth that should rule out self-interest, personal pocketbook considerations, and partisanship on an issue so basic and vital: the right to be sure of compensation for automobile injuries (hence the need for compulsory insurance) and the right to drive a car, which often equals the right to employment in today's world (hence the need for significant reduc-

\* Member of the Massachusetts Bar; former assistant to the Editor, Journal of the American Trial Lawyers.

tions, not increases, in automobile liability rates). The Keeton-O'Connell plan is far from perfect, but unless something better comes along it should be seriously considered and tried. The problem is critical—nay-sayers are not enough.

ROBERT H. JOOST.

#### LETTERS TO THE EDITOR

##### NATIONAL NO-FAULT

I was puzzled by your editorial on no-fault auto insurance entitled "Volpe's Wise Proposal" (April 19).

The editorial is puzzling primarily because it is no secret in Washington that Volpe was prepared to recommend national no-fault auto insurance legislation and that his recommendation was sabotaged by White House action.

The Globe may be right in arguing that a rigid national system of no-fault auto insurance would not be a sensible course at this time. On the other hand, if no-fault makes sense in Massachusetts, I see no reason why it does not make sense for the nation as a whole.

Legislating on a national basis on the subject of motor vehicles is hardly a novel proposition. I doubt that anyone would seriously suggest today that we should not have national standards for motor vehicle safety. Congress has also acted to impose auto emission controls on a national basis. In fact, it has gone so far as to deny states jurisdiction of any kind over auto emission controls.

Accordingly, the case for national no-fault auto insurance in some form is a strong one. Simplicity and uniformity of treatment are essential in a nation where so many of us cross state lines in motor vehicles every day. It would be tragic, in my opinion, to encourage a situation in which a crazy quilt of state no-fault laws emerges which results in changes in basic rules or gaps in coverage simply because a motorist leaves his home state.

There may be a sensible compromise between the no-action position of the Nixon Administration and the advocates of comprehensive national no-fault insurance. Congress could pass legislation this year requiring the states to enact no-fault laws within the next two years. The Secretary of Transportation would be given the authority to approve each plan but every state would have some latitude in developing its details so long as the state plan met certain basic criteria.

Such a course may be the one which Congress ultimately takes this year. It is, in my view, the minimum required if we are not to subject the motorists of the nation to a hodge-podge of conflicting laws and insurance policies in the years to come.

MICHAEL S. DUKAKIS.

[From the Journal of Commerce, Apr. 26, 1971]

#### BAY STATE'S INSURANCE INDUSTRY HIT

##### GOVERNOR CHARGES PROFITS ARE NOT PASSED TO CONSUMER

BOSTON, April 25.—The auto insurance industry was bitterly criticized here today by the Commonwealth's governor for failing to pass onto consumers the substantial savings the companies have incurred from the Bay State's three-month old no-fault auto insurance system.

Gov. Francis W. Sargent said that during the first three months of this year, the underwriters have seen their claim costs drop by over 35 percent but have not come forward with plans to lower premiums.

The governor also alleged that many insurers have tried to obscure the options in the no-fault program which would lower their auto insurance rates.

"The average paid claim cost in the first quarter of last year was \$205," Gov. Sargent said. "The average paid claim cost in the first quarter of this year is \$131. The total amount of paid losses in the first quarter of last year were \$359,590—this year they are \$229,479."

## 36 PC REDUCTION

"That is a 36 per cent reduction (in claim costs) this year over last," the governor said in an address before the Massachusetts Association of Independent Insurance Agents and Brokers.

The governor said if the average paid claim costs for 1971 hold at the present rate through June they will be 69 per cent lower than the first six months of 1970.

"Translated into possible future premium reductions that comes out to a further premium cost cut of 25 per cent for bodily injury insurance, though not property damage and collision for in those years price inflation and the high cost of auto repair drive these costs steadily up," Gov. Sargent said. "But in bodily injury, the only area affected by no-fault, we can at least hope for further cost cuts if present experience continues."

Gov. Sargent said he would release a statistical summary next week on the first three months of the first in the nation no-fault system.

"The great irony of no-fault so far is that the industry that fought it so hard is now profiting the most from it," said the governor. Further, the industry, while it profits, blocks the consumer from the benefit of the new system, he said.

Gov. Sargent told the insurance men they were keeping the public ignorant about how to take advantage of savings on auto insurance premiums.

"Last year we provided options in auto insurance to let the buyer build his own insurance program through bodily injury deductibles for those with sufficient health insurance," he said, "and \$100 and \$200 deductibles in property damage insurance."

"We encouraged companies to provide further deductibles to cut cost of collision and comprehensive insurance," he said.

"I am told the industry in some cases has not only failed to inform customers of these options but has actually refused to allow their purchase," Gov. Sargent said. "Worst of all, I am told that many companies have forced customers to buy more insurance than they want in order to buy any at all."

Gov. Sargent said he would order a "step up in investigation of the abuses so far charged—and the industry had better be ready to reply."

---

[From the Boston Sunday Globe, Apr. 25, 1971]

## WIRE TAPS

Attorneys are wondering about a couple of ethical questions raised by the activities of the lawyers bringing the test case of no-fault auto insurance law. The lawyers, Robert Cohen and Alexander Cella, have sent other attorneys a mimeographed form offering for sale at \$50 per set the two-volume brief (\$45) they have prepared on the case and the appendix (\$5). The case is to be heard next month before the Supreme Judicial Court. Fellow lawyers say (1) they've never heard of a lawyer openly selling a brief—"It's a little bit arrogant before you even win"—and (2) the appendix consists of court records, which may not be theirs to sell.

## A TRIAL LAWYER'S LEGISLATIVE WORKBOOK

## HOW TO DO IT

Q.: "What do you feel is the best method to establish and keep rapport with sympathetic legislators and how do you suggest bill introductions, legislative advocacy and hearings be conducted?—Do you have an active 'Legislative committee' in your state trial lawyers organization and how does it work?—Do any trial lawyer groups make campaign contributions to candidates to legislative office, or is this done on an individual basis? Outside of finance, do they aid him in vote-getting? How do you go about encouraging bright young plaintiff-oriented lawyers to seek legislative office? In general, how does your state organization handle 'legislative advocacy', appearance before committees, and follow-up on bills? Do you think it is necessary to have a full or part-time man on the job at the state capitol to keep members informed?"

(Texas: William R. Edwards.)

We have found that the best method of establishing and keeping rapport with legislators whether sympathetic or not (hopefully securing the help of those who are not necessarily sympathetic by so doing) is what I like to call the "buddy system". By this we mean the real responsibility for each of the legislators is placed on the trial lawyers located within their respective districts. We expect our members to befriend the legislators, to get to know them not only as political friends, but as personal friends. We endeavor to secure representative trial lawyers' membership in the district of each legislator. By virtue of such personal contact, we are able to secure the help and understanding of many legislators who are not lawyers and who have not had any real experience with our problems. Additionally, in the past year, we have made some progress toward securing help from non-lawyers convincing them that our programs are right and that by contributing their money and influence through us, such persons may be able to be of much greater influence in securing passage of such legislation that they could otherwise. One such non-lawyer from Dallas was of extreme help to us in our recent passage of the Texas Tort Claims Act, his interest in the matter having accrued by virtue of the death of a daughter caused by governmentally-immune conduct. Generally speaking, if a bill to be introduced is on its face one which is of a public nature, that is for the good of the people, as opposed to the good of the lawyers, we do not hesitate to have one of our strong supporters in the legislature, even one of our members, introduce the legislation, and in fact encourage it. However, as to strictly lawyer legislation, we prefer to get a non-lawyer member, one whose interests are not apparently aligned with ours to introduce the bill if possible. Because of our continued twelve-month-a-year program of legislative contact, we have never had any difficulty in securing introduction of any bills by the "proper" people. With respect to legislative hearings, our experience has indicated conclusively that if we will work closely with those committee members who agree with our position as to any particular legislation, and actively participate in the preparation of the case for our side of the bill, much as we would prepare a court case, that by virtue of careful preparation, including expert witnesses, statistics, etc. that we are ordinarily in a position to place before the committee hearing the bill a far better picture and far more effective case than the other side has usually taken the time or the effort to prepare. *Careful preparation* of the case for or against the bill cannot be over-emphasized.

We have a legislative committee and it is very active. It is the function of our legislative committee to see to the election of representatives who will support our positions, to formulate our legislative programs, to secure introduction of the bills we propose to pass and to shepherd those through to final passage and signature by the Governor. During the legislative session, in our office in Austin [state capital], we maintain a continuous program of public relations including an open bar and a buffet luncheon. During the last session of the legislature, we averaged in the neighborhood to twenty or twenty-five representatives and senators for lunch each day the legislature was in session. We have *one cardinal rule* with respect to the office we maintain in Austin across the street from the Capitol grounds: No lobbying may be done in the office. No pending bills may be discussed unless a particular legislator brings up the subject and asks that it be discussed. We have tried to make our office a place where the members of the legislature can come to escape the continual bombardment of lobbyists—where they get a drink or a good meal and relax. We are convinced that the legislators appreciate this rule.

Approximately two years ago we instituted a bank-draft plan whereby our members and anyone else we can persuade to do so contributes \$10.00 a month to a fund maintained in Austin. The fund has been recently renamed and designated LIFT (Lawyers Involved For Texas). This fund is available for use in election contests for either State Senator or State Representative—it is not available for use in the campaign of any candidate seeking state-wide office. The fund is administered by the legislative committee and the President of the Texas Trial Lawyers Association. It is distributed carefully to secure the greatest effect by the use of the money. We expect contributions wherever possible to be made on an individual basis. This program is in line with the "Buddy System" outlined above. However, there are obviously areas in which our membership is not in a position to adequately finance a candidate. Funds are made available on such a basis. Occasionally, there will be an extremely important race between a good friend and a bad enemy of the Association. In such instances we

may apply rather substantial amounts of money to the particular contest. Our members are encouraged to participate actively in the campaigns of legislators and candidates. We do all that is within our power—financially and otherwise—to support actively the election of candidates who are philosophically attuned to our goals. This is the only way it can be done.

The best encouragement that can be given to any candidate for elective office is the chance of winning. We find that our program in Texas has enabled us to secure candidates—both trial lawyers and non-lawyers—to run for office. The non-lawyers are only too ready to assist us when they fully understand our goals and programs. After all, what we are attempting to secure in the way of legislation is in the final analysis good for the people. So long as we continue in that posture, we do not feel it is important to lawyer as opposed to non-lawyers represent us in Austin. So long as our representatives are properly attuned to our program, the non-lawyers are often more effective in securing the passage of our legislation, than are lawyer members.

With respect to each bill that is introduced, a subcommittee of the legislative committee of the Texas Trial Lawyers Association is appointed. This subcommittee has the primary responsibility for the particular bill. The subcommittee is charged with: (1) drafting the bill, (2) securing the sponsors in both the House and Senate, and (3) shepherding the bill through the legislature. The subcommittee is responsible for the preparation and presentation of evidence at committee hearings. The subcommittee is also responsible for keeping the association informed of the bill's progress so that the association may—if necessary—put on a "show of force" at hearings or votes, etc., by calling the membership to Austin at appropriate times. We maintain a constant review of bills introduced to assure that no legislation simply slips by us without our knowledge. This is another task of the legislative committee. Regular reports on what is happening in Austin is disseminated by letter to all the members of the Texas Trial Lawyers Ass'n.

[Because of space limitations, only the Texas responses have reproduced. They appear to contain in more comprehensive form most of the ideas mentioned by other states' Key Men.]

Additional Texas ideas mentioned at regional Key Man Meeting, Denver, June 19, 1970:

"We have approximately 1,200 members in the TTLA. The only requirements for membership are that (1) one pay \$100 a year in dues and (2) be a lawyer who does not habitually represent insurance companies.

"We have had an executive director since 1962. The present Executive Director is a *professional lobbyist*, not a lawyer. He teaches us

"To have a successful trial lawyers' legislative program:

- #1. You have to have an appealable piece [pieces] of legislation.
- #2. You have to have a significant number of people who are able to discuss completely and intelligently the merits of that legislation.
- #3. Your program should be neither a Democratic nor a Republican program; neither a Populist nor an American-ist program. It must be a program for the public.

#4. The scope of the legislative program should be very narrow: to get more justifiable money into the hands of claimants.

"Legislative advocacy is a complicated art; there are no simple routes to effectiveness. The most unsuccessful lobbying group at the last session of the Texas legislature was a group that left a fifth of best-quality whiskey in every legislator's car. Reaction: "Hub, those ——— think they can buy my vote with a bottle of booze. ——— them." Subtlety and hard, intelligent work are *essential*.

UP, UP AND AWAY!!

LIFT is the latest effort of Texas Trial Lawyers Association. It stands for Lawyers Involved for Texas, and it's a runaway success . . . The *El Paso Times* reported in its Capital Column June 14th, that *LIFT was responsible* for the Democratic nomination in this year's primaries of six of the eight candidates it backed for the *State Senate*.

LIFT is a legislative kitty which is paying off. Most of your officers are contributing \$10 per month on a bank draft authority to LIFT.

If you want to be a part of the movement for *comparative negligence* in Texas, for statutory authority to let jurors know what they are doing in *special issue verdicts*, and for a successful rejection of *Keeton-O'Connell* schemes, in other words, if you want your practice to *survive*, better get with it.

Send a check, any amount, to *LIFT, 201 Westgate Bldg, Austin!*

Observation by Nebraska State Senator [Nebraska has only one house of legislature—49 Senators] at Denver Key Man meeting, June 1970:

"We never hear from the lawyers of Nebraska except when we are about to vote on a bill that is of interest to them. Thus, it is not surprising that when we voted on repeal of the automobile guest statute, there were only 8 votes out of 49 in favor of repeal. Contrast the trial lawyers whom we never see with the bankers who are the most highly organized group in the state. The Nebraska Bankers Association is always around to lobby and to help and to answer questions—including questions totally unrelated to legislation affecting banks. We build up confidence, rapport, friendship with the bankers. The lawyers are unknowns whom we ignore in turn."

(Attention: Mr. Jack C. Eisenberg.)

DEAR JACK: You have inquired of us whether the expenditure of dues of the Association for purposes of retaining a legislative counselor might have a bad tax effect on the Association.

In our opinion, which must necessarily be rather hastily given because of the time pressure involved, this would have no effect upon the tax situation.

If you will refer to our letter of May 28, 1965 regarding the deductibility of dues or contributions you will note that Denny Ingram concluded that dues were not deductible as contributions but only as ordinary and necessary trade or business expenses. In reaching this conclusion, Denny opined that the Association could not qualify as a charitable organization under IRC Section 501(c)(3). I agree with his conclusion although I have not re-checked it in detail and am relying on it. It is true that 501(c)(3) organizations are forbidden to attempt to influence legislation as a substantial part of their total activities. However in my view the Association falls more nearly under Section 501(c)(6) as a Business League, Chamber of Commerce, or organization of the same general class, being an association of persons having some common business or professional interest, the purpose of which is to promote such a common interest and not to engage in a regular business of the kind ordinarily carried on for profit. If I am correct in this conclusion, and I think I am, the most recent authorities which I have been able to find indicate that legislative activity does not defeat the exemption if it is otherwise allowable, and this even though the legislative activity is the organization's sole or principal activity. See *Washington State Apples, Inc.*, 46 B.T.A. 64; Rev. Rul. 61-177, 1961-2 C.B. 117, modifying Rev. Rul. 54-442, 1954-2 C.B. 131. Nor does the statute itself contain any requirement that organizations falling under 501(c)(6) refrain from legislative activity as does Section 501(c)(3), applicable to charitable organizations generally.

For the above reasons, I do not think that the retaining of legislative counsel by the Association would effect either its tax status or the tax status of dues paid in by its members. I hope that the foregoing answers your question adequately and if you have any further questions or wish further light on the subject, please let me know and I will attempt to oblige.

Yours sincerely,

THOMAS G. GEE.

Texas Association of Plaintiffs Attorneys,  
314 Austin National Bank Building,  
Austin, Tex.

(Attention: Mr. Tom Davis.)

GENTLEMEN: This letter is designed as our preliminary opinion to you concerning the status of the present method of dues payment in your association, your present organizational structure, and recommendations for future operation and changes in structure.

Your present method of dues payment involves variance in the amount of the dues. You are concerned that some large dues payments or contributions might be denied income tax deductibility to a fixed dues schedule and without any definite or substantial added membership benefit.

The variance of dues is a procedure quite customary when there are varying classes of members in a professional organization. Customarily, enhanced benefits accompany a more expensive form, or higher class, of membership. Such benefits might include the receipt of additional literature, more prominent personal publicity, and perhaps even a forgiveness of future dues for a definite or indefinite period of time. Generally, extremely wide variations in dues payments of classes of members is seldom found.

Accordingly, some of your dues payments are not too ordinary in their nature, and there does indeed exist a serious question as to their deductibility when made in large amounts virtually in the nature of a gift or contribution rather than within an established reasonable framework of dues.

There are only two possible theories under which the dues can be deductible:

First, that they are donations to a charity pursuant to Internal Revenue Code (I.R.C.) § 170. Since contributions to a local bar association have been denied such favorable treatment and since there is ample authority of similar import for other professional and trade organizations, it must be concluded that the dues are not deductible charitable gifts. GCM 4805, 1928 C.B. 58, and *P-H Federal Taxes*, ¶ 4522. The basic reasoning is service to a private rather than a public cause. Authority granting deductible treatment for gifts to organizations such as The State Bar of Texas must be distinguished because that type of an organization is deemed an arm of the government. R.R. 59-152, 1959-1 C.B. 54. Also note that the fact that an organization is a charity exempt from income taxation under I.R.C. § 501 or exempt from income taxation simply because it does not make a profit, does not control the question. The tests of coverage under § 170 and § 501 are different.

Second, the dues may be ordinary and necessary trade or business expenses. I.R.C. § 162. Regulations § 1.162-6 expressly allows the deductibility of professional expenses including "... dues to professional societies and subscriptions to professional journals. . . ." However, each such deduction must withstand the test of being "ordinary and necessary." A review of the cases and treatises reflects much litigation or administrative activity concerning this language. See 1 Rabkin & Johnson, *Federal Income, Gift, and Estate Taxation*, § 3.02; *P-H Federal Taxes*, ¶ 11,031; 4 Mertens, *Law of Federal Income Taxation*, § 25.09, 25.122; and Carson and Weiner, *Ordinary and Necessary Expenses* (1959). It is quite possible that a large contribution not providing any added benefit over a smaller contribution might be neither ordinary nor necessary.

How can this doubt be resolved? Unfortunately, the lack of authority in the area provides little possibility of a reliable answer. But, some guidelines, including observance of the patterns of other organizations, can be evolved in order to lessen the probability of serious questioning of the dues system. First, classes of memberships can be based upon some reasonable bases such as time in practice, honors and publicity accorded certain classes of members, special privileges to certain classes of members, etc. Second, advance payment of dues might be permitted for reasonable periods. Third, a companion organization might be founded which serves the general public more so that it will qualify as a charity under I.R.C. § 170 to which a deductible contribution can be made. Compare, for example, the American Bar Association Endowment and the American Bar Foundation, two charitable foundations which are allied to the American Bar Association. If such an allied organization is formed, you should seek a tax ruling of its status for contributions and for exemption of its income.

As for your organizational structure, we would recommend that your association be reorganized as a Texas non-profit corporation in order to provide the limited liability, definiteness of structure, and other attendant benefits thereby offered. This structure is easier to explain to taxing authorities, offers a clear answer of lines of authority for contractual relationship as well as any possible intraorganizational disputes, and avoids the general partnership liability each member now has.

We will be glad to confer with you to provide further detail on any of the foregoing matters.

Sincerely,

DENNY O. INGRAM, Jr.

Senator HART. Because of a phone call we must recess briefly.  
(Recess.)

Senator HART. The committee will be in order.

Let me welcome Mr. John J. O'Brien of Newtown Square, Pa.  
Mr. O'Brien, we appreciate your testimony.

#### STATEMENT OF JOHN J. O'BRIEN, NEWTOWN SQUARE, PA.

Mr. O'BRIEN. Senator Hart and committee members, I reside in Newtown Square, Delaware County, Pa. I am employed as an insurance manager by the Franklin Mint, Inc., of Franklin Center, Pa. I am here as a concerned citizen to speak on behalf of automobile liability insurance reform. Before giving my testimony, it might be helpful if I commented on my educational and employment history. After receiving a bachelor of law degree in 1950, I was employed for approximately 11 years by insurance companies in various claims positions, including those of adjuster, examiner and manager. I was national director of claims services of Avis Rent-A-Car Systems for 3½ years and insurance manager of the Mack Truck Corp. for 5½ years.

Over the years, I have become totally convinced that our present system of tort liability does not satisfy the principal purpose of liability insurance, which is to see that innocent victims are paid their losses. Of course, as an insurance claim representative, I was taught that was not the principal purpose of liability insurance, rather I was educated to believe that my principal responsibility, and I might say properly so, was to conserve company assets by settling claims for the lowest possible dollar. A good settlement most frequently was not one that was fair.

It is a well-documented fact that the current system works unfairly. It favors the affluent and mitigates against the poor. The individual injured in an auto accident who is living from payday-to-payday is a soft touch for an experienced adjuster. There is also gross inequity in the amounts paid in the settlement of claims. The small bodily injured claimants are often overpaid, while the seriously injured often collect but a fraction of their losses, after payment of attorney fees that average 25 percent of benefits.

We hear more and more complaints about the soaring cost of automobile insurance, as well as the inability to purchase coverage at any cost outside of an assigned risk pool.

The backlog of tort cases is insuring that those who have to pursue their claims in court can in some cases wait as long as 5 years for a verdict. If they are unable to work and require income, to whom do they turn? Quite often they are carried by their attorneys. I believe that in agreeing to this, they are joining the attorney in basically unethical conduct. In many cases their personal resources are totally inadequate.

The fault system is obviously failing to meet the needs of motorists, and reform appears to be imminent.

I have read with interest the Hart-Magnuson proposed "Uniform Motor Vehicle Insurance Act (S. 945)" which incorporates the no-fault liability insurance concept. I believe such a law by the Federal Government is desirable, since it is apparent that the States will not

voluntarily adopt uniform legislation. By mandating a model bill to the States the problem of liability insurance reform would be resolved.

In my opinion, the legislation under consideration could serve as a model bill, subject to some amendment and deletion. The bill's definition of catastrophic loss (page 3, lines 17 through 21) is too restricted. Would not the term "catastrophic harm" as defined, exclude, for example, a surgeon or concert pianist who lost the tip of a finger, or one who suffered residual stiffness in his fingers?

The definition of economic loss (page 4, lines 7 through 15) should be amended to pay a percentum of the individual's income without limitation. A limit of \$1,000 a month would in many instances be totally inadequate to meet the needs of injured claimants.

Page 11 from line 19 through line 21 of page 12 should be deleted. This portion of the act has to do with putting an additional part of the burden on the trucking companies.

In my opinion, the provisions contained in this section are unreasonable. Those underwriters who specialize in insuring heavy-duty trucks would of necessity require more premium, the cost of which would in all probability be passed back to the public. It would be more equitable to assess the cost against all motor vehicle owners.

I was delighted upon reading the provisions of the proposed "Motor Vehicle Group Act (S. 946)." As a corporate insurance buyer one of my most frustrating experiences is to have someone in management come to me with a problem involving his personal automobile insurance. Despite the clout of hundreds of thousands of dollars in premiums for which I am responsible, I can rarely get my principal underwriters to extend coverage to an individual who has received a declination.

As an example, one of our executive's 17-year-old son worked and saved to buy an automobile. After the acquisition, the car sat in the driveway for months because he couldn't obtain insurance. The young man finally saved the \$374 required to buy insurance in the Pennsylvania assigned risk plan. He has inadequate coverage—\$10,000—\$20,000 bodily injury and \$5,000 property damage—and is a menace in the sense that if he has a serious accident, for which he is at fault, severe economic loss could be incurred by one or more innocent people.

If I could offer the employees of my firm group automobile insurance, underwritten subject to the terms of S. 946, many of these problems would be eliminated. The reason I cannot make such an offer is that the interests of the few is being given precedence by the States over the interests of the many. The insurance agency system will be hurt if corporations and associations are permitted to have access to group auto coverages. That would be unfortunate but again the special interest of a particular class should not be given priority. The reduced cost, easy payment by payroll deduction and availability of coverage to the individual, who in many instances cannot buy insurance at equitable rates, far exceeds our concern for the agency system.

In addition to the foregoing testimony, I will be happy to answer any questions of Senator Hart.

Senator HART. Mr. O'Brien, just as I commented to Mr. Joost, it is not an easy decision for you to come down here and speak this way, which makes it even more obvious my obligation to thank you on behalf of the committee for telling us this.

You speak from a background that is very broad, and I would think it is the kind of testimony that would be most persuasive.

Mr. O'BRIEN. Thank you.

Senator HART. You mention that in the insurance business a good settlement isn't necessarily a fair settlement.

Mr. O'BRIEN. That is so true.

Senator HART. Could you tell us a little more fully what you mean by that?

Mr. O'BRIEN. I have in my own experience defended settlements that I have made, third-party liability settlements, to my immediate superiors, and when they didn't compliment me, I have said to them, "but it was a fair settlement." And most often as not, they would turn to me and say "Fair, but not a good settlement."

And we knew what was meant by a good settlement. The first call settlement made by an adjuster for the out-of-pocket expenses, plus a few dollars over and above for inconvenience, pain and suffering is considered a good settlement. Insurance companies favor first call settlements for the primary purpose of closing out claims before the injured parties fully realize the extent of their damages or injuries.

Senator HART. How would they become fair settlements under the mandatory first-party system?

Mr. O'BRIEN. Because they would no longer be adversary settlements. It would be a matter of settling a claim with your own insured. You treat your insured a bit differently than you treat a total stranger whom you believe is interested in taking as many dollars from you as he can.

That is not to say that the insured will not be interested in getting as many dollars as he can, but the relationship will be totally different and it does tend to a more equitable settlement.

Senator HART. That is probably the way I should have put the question. It would produce a more equitable settlement?

Mr. O'BRIEN. That's right.

Senator HART. Certainly, those expenses legitimately incurred, including the potentially substantial area of rehabilitation would be a fixed obligation.

Mr. O'BRIEN. That is correct. Additionally, Senator Hart, the injured party, if treated improperly by the claims adjuster has his agent to turn to who in turn can go back to the underwriting department, the sales department, if you will, and it usually has sufficient leverage to bring the claims department in line.

Senator HART. You said one of the pressures that operates under the existing system is the delay where a man is in need of funds. You mentioned a backlog of court cases.

Now, in our hearings the suggestion has been made to us that we ought to establish an arbitration system, at least for the smaller claims. That would both reduce the court backlog and it would lower expenses, administrative expenses.

Philadelphia does arbitrate, as I understand it, claims under \$3,000. As you have observed, has there been any savings in administrative costs?

Mr. O'BRIEN. I have not been in the Philadelphia area for more than a year and a half. I am not prepared to say I know firsthand, but comments that have been made to me would lead me to believe that there isn't any real savings.

I can't see that arbitration and the speeding up of the settlement of cases, reducing the court backlog, would help to reduce the cost of insurance to individual policyholders.

If anything, I think if you speeded justice up, more people would be inclined to obtain the services of attorneys to represent them in their cases.

Senator HART. That certainly was the point that was made or the conclusion that was reached in a very detailed study that the Department of Transportation made.

You put your finger on a section of the bill that all of us realize we are going to have to work on, and that is section 4. You spoke of the surgeon who might lose the tip of a finger. You have already contributed substantially to the work of this committee, but maybe we can enlist you for another job.

If possible, could you suggest, in writing later to us, some language that might help us achieve what we are really after to safeguard, get rid of the spurious pain and suffering claims and yet recognize in the case of the surgeon who loses a finger that there is very substantial economic loss that would be called pain and suffering.

Mr. O'BRIEN. It could be a matter for the medical profession. It has been suggested to me that perhaps in pretrial a court-appointed doctor, or panel of doctors, could evaluate the injury sustained by the would-be plaintiff, and if, in the opinion of the appointee, taking into consideration the person's occupation and other pertinent circumstances, the doctor or panel of physicians reported back to the judge, yes, this individual has suffered catastrophic loss, this would be his or her entry into court to sue in tort.

Just having a term to be defined by—let me ask you a question. Who would determine this, as you have drafted the bill?

Senator HART. A court, as it is drafted here.

Mr. O'BRIEN. May I also comment on using, as in the case of Massachusetts, \$500 medical expense as the trigger for a tort action?

Senator HART. Yes.

Mr. O'BRIEN. I am amazed that anyone today would think that this was any sort of barrier. In any major city, I can put myself into a private room for 3 or 4 days for not necessarily treatment but just examination, and I will have a bill in excess of \$500. Once again I think the medical profession should be brought in, and this should not be tied to medical expense, because any able attorney in conjunction with doctors, who, in many cases, are more than willing to cooperate, can build the client's medical bills to the necessary level.

Senator HART. Capable but not ethical.

Mr. O'BRIEN. There is a difference.

Senator HART. You heard the testimony earlier today from Mr. Joost. You are recommending the adoption of S. 945 so that it applies nationally. Does this suggest that you believe that the States would not move in a uniform way to change the present compensation system?

Mr. O'BRIEN. More than suggest. I am totally convinced that the States will never do it. I attended a meeting of the State of Pennsylvania Chamber of Commerce Insurance Consumer Committee, of which I am a member, just a few weeks ago, and the motion was made that we advise the chamber that action should be taken in the area

of a State no-fault plan, but should it be the Massachusetts plan, should it be another plan, no one seemed to know.

As sure as I am sitting here, if 10 years from now the Federal Government has not moved in this direction, you are going to have a hodge-podge of laws that will be intolerable. I don't want to see the Federal Government set up a bureaucracy to administer a Federal program. I think it is to the best interest of us all that the States have a model bill and administer the bill under some form of supervision by the Federal Government.

Senator HART. Again, Mr. O'Brien, I am grateful you could come and speak as you have. I am sure that you will not be applauded by all of your old friends in the business but, as you say here, the special interest of the particular class should not be given priority.

Everybody buys that as a principle and yet human nature being what it is, we never recognize that we are making an exception to that principle often. We just don't realize it.

Mr. O'BRIEN. That was not true in the case of the corner grocer. If he had had the wherewithall to have legislation enacted against supermarkets, we would be waiting in block-long lines to buy our groceries from the man on the corner.

So, what I am saying is we have reached a point in time where we must have change. The change is painful, but after it takes place, I think it will work better for everyone. I am now being offered that which the industry refers to as the mass marketing of personal lines—homeowners and automobile insurance on a payroll deductible basis.

Of course, under mass marketing, we still have the problem of the individual who is subject to underwriting. It will not answer—it will not solve the problems that would be resolved by group coverage, but the industry itself recognizes that it has to move in that direction if it is to avoid group personal lines.

I am referring to my comments under 946.

Senator HART. Yes, you were very explicit in your support of that, very explicit, and the example you cite is a sobering one.

Again, we are very grateful that you have come down.

Mr. O'BRIEN. It was my honor.

Senator HART. We will recess until 2:30 p.m.

(Whereupon, at 1:40 p.m., the hearing was recessed, to reconvene at 2:30 p.m., this same day.)

#### AFTERNOON SESSION

Senator HART. The committee will be in order.

We resume our hearing this afternoon having as our first witness the president of Aetna, Mr. Frederick D. Watkins.

Mr. Watkins, welcome.

#### STATEMENT OF FREDERICK D. WATKINS, PRESIDENT, AETNA INSURANCE CO., HARTFORD, CONN.

Mr. WATKINS. Thank you, Senator.

To begin my testimony this afternoon I would like to present for your information a film that was produced by the Aetna Insurance Co. to respond to what we believe is a very urgent need in connection with no-fault insurance—an informed public.

We feel that there is a great void in public understanding of what the present automobile insurance system really is, and what we are trying to accomplish in advocating the no-fault principle.

This is a documentary film. It includes proponents and opponents of the no-fault concept. We feel that it does a good job and we intend to use it wherever we possibly can across the country to better inform the public. We are not trying to sell insurance with it. We are trying to inform people.

With your permission, sir; we will let it roll.

Senator HART. I would like very much to see it.

(Film presentation.)

Senator HART. As we go back on the record, Mr. Watkins, I am sorry that the record itself cannot carry the film which you have just shown. Whatever point of view one held with respect to no-fault, I think there would be agreement that the film presentation is a public service contribution of real significance, and I am delighted to have a chance to thank you and Aetna for doing it.

Mr. WATKINS. Thank you once again for your participation in it. I think you made a noble contribution to our film and the work we are attempting to accomplish.

Sir, would you like me to proceed with my statement?

Senator HART. Please.

Mr. WATKINS. Mr. Chairman, I am happy to have an opportunity to be here.

For clarification, I am Frederick D. Watkins, president, Aetna Insurance Co.

As your committee is all too well aware, automobile insurance today is sorely in need of reform. Investigations and hearings over the past 2 years, including those of congressional committees and the Department of Transportation, have documented the facts substantiating the failures of the present negligence system beyond any dispute.

Because the need for reform is no longer the critical issue at these hearings, I would like to restrict my comments today to what I consider central questions before this committee: What type of reform should be enacted and whether it should be a matter for State or Federal initiative. What shape should reform take and how should it be implemented?

My own company's position is clear. Aetna endorses any plan that would introduce the no-fault concept of automobile insurance in either a pure or a modified form. We believe that the primary responsibility for this reform lies with the governments of the individual States. Thus, we support the recommendations of the Department of Transportation for State action guided by national goals.

Our approach is a pragmatic one in that we believe it is warranted both by the present situation and by the potential advantages of the no-fault reform initiated at the State level.

Let me elaborate.

Over 5 years ago my company advocated a first-party compensatory system of automobile insurance patterned after workmen's compensation to replace the existing tort liability system.

It was our belief then, as it is now, that the majority of ills associated with the present system revolve around the necessity of determining fault, case-by-case, in millions of traffic accidents each year.

This time-consuming and expensive process restricts our ability to serve the public and to assist and protect the injured accident victim.

For this reason we advocate reform that would enable us to promptly pay an individual insurance benefits on the basis of his economic losses rather than on the basis of his fault or nonfault in an accident.

Most of the proposals being considered in the States and at the Federal level are based on this no-fault principle. This includes the most prominent plans developed by Professors Keeton and O'Connell, the American Insurance Association, the New York State Department of Insurance—your own, sir—and most recently the recommendation of the Department of Transportation.

As far as the basic insurance concepts are concerned, these proposals and their numerous derivations differ more in degree and in detail than in substance. All would provide for first-party benefits to accident victims, regardless of fault, covering medical and rehabilitation costs, wage loss, and miscellaneous expenses. The compensation would be paid promptly on a period basis.

To the extent that losses could be recovered on a no-fault basis—under some of the plans there are limits established—individuals in an accident would not be permitted to sue each other.

The concept has obvious merits. Most importantly, it would compensate all accident victims promptly according to their actual economic losses. Secondly, by eliminating much of the legal and investigative costs of the present system, it would reduce rates for the consumer and return a greater percentage of the premium dollar to the accident victim.

No-fault would also encourage a more balanced approach to traffic safety by restoring the proper role of the law enforcement bodies in dealing with criminal drivers rather than attempting to impose this responsibility upon the insurance system.

There is no universal agreement on the merits of no-fault, however. Some critics have referred to no-fault as a "victim tax," which in effect would take benefits away from the innocent in order to pay the guilty.

In truth, no-fault would guarantee fair compensation to all parties in an accident. Not even the innocent victim can be sure of as much under the present liability system.

I might add that no-fault, whatever the specific plan, should not be a straitjacket on the insured individual, any more than minimum liability coverages are today.

Individuals should certainly have the option to purchase coverages to suit their particular needs and wants. But the important thing is that no-fault would provide a basic level of compensation for everyone involved in automobile accidents instead of ignoring a significant number of victims.

Many opponents are particularly dismayed by no-fault's renunciation of the common law concept of tort action in accident cases. I would like to read you part of what I consider to be a persuasive answer to these critics:

In the days of manual labor . . . and the stagecoach, there was no such problem, or if there was, it was almost negligible. Accidents there were in those days, and distressing ones; but they were relatively few and the employee who exercised any reasonable degree of care was comparatively secure from injury.

There was no army of the injured and dying, with constantly swelling ranks, marching with halting step and dimming eyes to the great hereafter. This is what we have with us now, thanks to the wonderful material progress of our age, and this is what we shall have with us for many a day to come.

Legislate as we may in the line of stringent requirements for safety devices or the abolition of employers' common-law defenses, the army of the injured will still increase, and the price of our greatness will still have to be paid in human blood and tears.

To speak of the common-law personal injury action as a remedy for this problem is to jest with serious subjects, to give a stone to one who asks for bread. The terrible economic waste, the overwhelming temptation to the commission of perjury, and the relatively small proportion of the sums recovered which comes to the injured parties in such actions, condemn them as wholly inadequate to meet the difficulty.

This passage was part of a decision written by Judge J. C. Winslow in *Borgnis v. Falk Company*, a case heard by the Wisconsin Supreme Court in 1911, 60 years ago.

Senator HART. One could only hope that anything we said would be as prophetic—what is it 60 years later—as what Judge Winslow said in that case that you excerpted. I have not seen this before.

Mr. WATKINS. It is considered a landmark case in workmen's compensation. As you point out, sir, its application today is obvious.

The insurance industry does not present a unified front either for or against no-fault, as you know. Some segments of the industry, including some insurance companies, are very outspoken against a first-party system. Other companies, including my own, have fully endorsed the concept.

What motivates our company to support no-fault?

Some people, notably the critics of no-fault, claim that insurance companies are pushing for this program in order to avoid paying large jury awards, to clean up on profits, and in general to exploit the consumer and the public. This is nonsense.

By any test, our business will stand or fall on the quality of service we render our customers—the insuring public. No-fault will help us meet this objective, not contradict it.

I personally believe that a no-fault system would have a favorable impact on the current crisis of insurance availability. Auto insurance is hard to get for a number of reasons, including restrictive rate regulation in many jurisdictions. But the problem goes deeper than this.

The fact is that the liability system itself makes it necessary for insurers to try to identify and insure only the best drivers—those likely to escape accident involvement—in order to avoid the unpredictable costs of accidents involving unknown third parties and their automobiles.

This effort is inevitably frustrating, I might add. But the result is that drivers in certain categories in certain locations find it virtually impossible to obtain auto insurance coverage on the open market. Thus they are forced into assigned risk plans.

I feel certain that a no-fault system would lead to expansion of the automobile insurance market. Underwriting standards would be significantly changed.

An individual's driving record would still be important, but so would his income, the size of his family, the kind of car he drives. These are predictable factors, with assignable values.

In short, insurers would be able to figure more accurately the costs of the risk they assume and, in a free and competitive marketplace, would be able to offer coverage to virtually all drivers.

I believe, and my company and its affiliates believe, no-fault reform would ultimately improve the situation not only for the public but for the insurance industry by making possible more reasonable and realistic pricing of our product.

Today, sharp fluctuations in losses make the insurer's position too precarious to tolerate premium levels predicted on narrow or nonexistent profit margins and require the application of long-range trend factors in the pricing computation.

Under a first-party system, based on largely determinable rather than wholly unknown exposures, we would be able to predict losses with a greater degree of accuracy. Thus we would be in a better position to develop adequate rates based on moderate but realistic profit margins, avoiding the violent swings that have characterized our business for the past 10 years or so.

In summary, both from the point of view of the public and the insurance industry, no-fault would be meaningful reform. I strongly believe this.

I also believe that no-fault would be best implemented at the State level by the State governments, and I hold this view for what I regard as a most cogent reason.

In developing the no-fault plan that will be most effective in practice, we can learn much from the natural process of experimentation that occurs among the various states.

While the no-fault concept itself may be a rallying point for most reformers, there is no consensus on the best type of plan.

Some plans would set tort action thresholds at one figure; some at another. Some plans would pay total actual wage loss; others would set monthly limits of \$750 or \$1,000 or a specified percentage of salary. Some plans would include property damages in addition to bodily injury; others would not.

Before the public, the insurers, and the legislators can reasonably determine the relative merits of each plan, we need to experiment, and this is most appropriately carried out at the State level.

There are additional reasons, I think, why reform should be at the State level. State governments are closer and potentially more responsive to the particular needs of their constituencies, and in the matter of automobile insurance these needs may vary considerably.

Cost of living, for example, particularly medical care costs, often differ greatly from State to State. Contrast New York State to Mississippi.

Finally, the experience developed by the States in their traditional role as regulators of insurance—including the immediate availability of professional staffs knowledgeable in insurance—could be put to good use in dealing with reform at the State level.

Despite my strong preference for State rather than Federal action, I want to make it clear that I am neither dismayed nor frightened in any way by the interest being given to auto insurance reform by the Federal Government. On the contrary, I am encouraged by it. I am encouraged because it brings the urgency of reform into sharper focus.

The activities of this committee, its counterpart in the House, and the Department of Transportation—these activities provide not only direction for the States but incentive for them to act positively and without delay.

Most importantly, Federal attention to the problem serves to alert the public. This is crucial. Ultimately public pressure will stir even the most recalcitrant State legislature to reform.

You may be interested in some recent events in my home State of Connecticut, which illustrates this point. This year the Connecticut legislature is considering no-fault for the second time. The first time was 2 years ago when my good friend William R. Cotter, then insurance commissioner and now our Representative from the First Congressional District, sponsored an unsuccessful drive to have a no-fault plan adopted.

This year, however, reformers were more optimistic. The major no-fault bill under consideration by the legislature has the backing of the State labor council and a large portion of the local insurance industry. In addition, the press has been very forthright in its support of the no fault.

In spite of this, the unanimous decision of the legislative committees considering the bill, a decision reached 3 weeks ago, was to appoint a study commission to report back to the legislature next year.

This was a blow to those of us who considered prompt action to be imperative, but with this massive opposition we were realistic enough to view the matter as virtually dead in the current session.

Now it appears that we underestimated the enthusiasm of both the press and the public for no-fault reform. Editorial writers have been very critical of the committee action and, as a result, today there is reason for some optimism. State Senator Lieberman, the sponsor of the bill, and his associates have secured the necessary votes to petition the bill out of committee.

Not too long ago capital experts in Connecticut were saying such an achievement would be a virtual miracle. Today we have that miracle. It is to the credit of Senator Lieberman and his own tenacity in fighting for reform. It is also evidence of the timeliness of the no-fault issue itself.

Although the outcome of the critical votes in both houses of the legislature still remains to be seen, at least for the time being, no-fault is alive once again in Connecticut.

I am convinced that public pressure for reform is the most powerful force behind no-fault auto insurance. This is suggested not only by events in Connecticut but by various studies which show that an informed public is overwhelmingly in favor of no-fault as an alternative to the present automobile liability system.

An informed public will support no-fault. But a public that does not understand the issues is a hindrance to reform. Results of a Gallup poll published recently dramatically illustrate the need for better public information.

In summary, the findings of this poll were as follows: Of the people interviewed on April 3 and 4, 1971 only 19 percent understood the basic features of no-fault. Of this total, however, support for no-fault was 4-to-1.

Clearly, it is extremely important that public concern be activated. I am confident that these hearings and those of the House committee will help to serve this purpose of public education.

As I said earlier, this was the reason that motivated us to produce this film and it is our firm corporate purpose to pursue in every way

we can this concept of no-fault. We think it is in our best interests, in the long run, because what is good for the consumer we feel will benefit us if it is to last.

Beyond this, sir, I would like to see this committee give its endorsement to the recommendations of the Department of Transportation, thus recognizing that the overall public interest would be best served by adoption of no-fault reform and its implementation at the State level.

Again, I thank you for the committee's invitation and this opportunity to present our views for your consideration.

Senator HART. It is that kind of thoughtful, and I think balanced testimony that is most useful to the committee. We appreciate your willingness to discuss it as you have. There is really great appeal in logic to your suggestion for waiting until we experiment at the State level.

Mr. WATKINS. Sir, may I—

Senator HART. If I had more confidence in the State action, I probably would be less hesitant to accept that as the prudent course. I do agree with you that the more people—all of us—come to understand what is involved the better. And understanding must include first an appraisal of what the system is that we have been living with. It is not surprising to me that only 19 percent of the people expressed an understanding of no-fault.

Was that the figure?

Mr. WATKINS. That is correct.

Senator HART. I am not sure many more would be able to say they understood what we have now. That is not critical of Aetna; I mean it is the nature of the animal. The broadest understanding possible is very desirable. And that film again will help.

If you advertise its showing in advance you will probably find included in the audience fellows like me who want to get up and explain why the no-fault feature is better, and you might find a trial lawyer there who might explain that the individual will be brutalized and who knows who else?

Mr. WATKINS. Mr. Sargent was there, but let me assure you, sir, that we paid no fees for participation in this film.

Senator HART. One point you make though about the present system. You say that among the arguments the critics make against no-fault is that it is a victim tax hurting the innocent and paying for the guilty and so on. You say it would, in truth, provide fair compensation to any and all parties in that accident. And then here is the point we ought not forget; not even the innocent victim can be sure of as much under the present liability system.

Mr. WATKINS. That is right.

Senator HART. We are going to have to run around the track a long time before they convince me that that statement is not correct.

Mr. WATKINS. We feel very sincerely that it is correct, sir. Unfortunately, in the present system, the public as a whole doesn't understand what we are insuring. We are insuring liability coverage for other people, legal liability. We owe our insured the obligation to protect him in that position as well as we can. We have no obligation to the third party, that is why it is called third-party liability insurance as you know, sir. But the average man and the public doesn't

understand that. He feels everybody should be compensated as is the case under workmen's compensation. And by public acceptance, if not by law, the automobile is such a social instrument now—in fact, every man has the inalienable right to drive an automobile—we feel that the only way this can be resolved is with a first-party system.

I have not been able to find, sir, a single instance in any of the States where a driver has lost his right to drive permanently, regardless of what he has done with his automobile. And the insurance system cannot be made the policemen of that type of a driver.

Senator HARR. On that very point, the difficulty of getting a driver, whose lack of responsibility has been demonstrated many times, off the road, I hope will be commented on by a witness tomorrow.

As happens periodically, both of our Detroit daily papers in the past have run series on this. You know, where there is a driver with an arm's length record who is still out on the road. And I think it was sparked by just a tragedy of a few weeks ago where a driver with that kind of a record jumped a lane on an expressway and wiped out a family.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Thank you, Senator.

Mr. Watkins, in your—

Senator HARR. Now, I am not suggesting that the Federal Government should take over the licensing of automobile drivers. We have problems enough. But referring now to the reliability of letting States experiment with no-fault, why do you think we should allow States which have been so wretched even in the simple matter of getting a nutty driver off the road guide the development of insurance reform?

Mr. WATKINS. That is true, sir; and I don't honestly believe that we will, within the course of a few years, have all 50 States adopting this type of legislation. My statement didn't mean to imply that I felt there should be a permanent moratorium on Federal action. I heartily endorse the concept of national guidelines. I think you have laid down some excellent guideposts in your proposed legislation.

But, I think that since it is new, the public would be much better served if we could try various experiments without having mandated one system countrywide at one fell swoop.

Over the long pull, in a few years, if individual States haven't acted, I think we should review the bidding and then Congress should probably enact legislation that would either force the States to adopt minimum programs or the Federal program would become the law in the noncomplying States. In other words, Congress would mandate the individual States because they have had ample opportunity. Then through the experimentation process the individual State would—could if it wanted to—amend or adopt regulations that would ride over the Federal law but they would never be permitted to fall below it. It is simply a matter of time, sir, I think.

Senator HARR. To what extent are you troubled by this suggestion that if all or most of the States did adopt no-fault but in a variety of patterns, that the complications resulting from simply the multiplicity of plans given the mobility of the driver of the car, would be a disservice to us all? How do you respond to that?

Mr. WATKINS. We have a similar circumstance right now. Massachusetts had its own—even before it adopted its no-fault plan Janu-

ary 1 of this year—compulsory insurance statute. A driver in Connecticut, whenever he got into Massachusetts, had a policy that automatically complied with the Massachusetts law. He was protected. And I think that during this experimentation process, policies would be issued to recognize these circumstances of the varying States.

If a man from Massachusetts, which has a no-fault law, were driving in, say Pennsylvania, where there isn't, and if there is an accident, he would be protected with whatever requirements might be in the Pennsylvania law, which of course would be basic third-party liability.

Senator HART. Thank you. Mr. Sutcliffe?

Mr. SUTCLIFFE. Thank you, Senator.

Mr. Watkins, pursuing the matter of the guideline approach, it was reported in the *Washington Post* following the testimony of Secretary Volpe in the House, that he had modified his position as to what he meant by national goals, and was willing to accept somewhat more of a Federal guideline approach capable of building a floor and a certain degree of uniformity into a State-by-State approach.

I judge by your comments that were the Congress to act now, you would not be adverse to a guideline into which a State plan would have to fit.

Is that my understanding of your statement?

Mr. WATKINS. Well—

Mr. SUTCLIFFE. Or have I stated it too strongly?

Mr. WATKINS. I believe you stated it too strongly, Mr. Sutcliffe. I am not in sympathy with the concept of a Federal mandate.

Mr. SUTCLIFFE. You see there are degrees of mandation. As the Department of Transportation study shows there are one, two, or three possible stages of development of no-fault—mandatory first-party coverage of medical expenses, wage replacement, and property damage. Certain possible gradations of tort exemption coinciding with the policy set forth could also be prescribed. We could set out guidelines, that said within the next 3 years, 2 years, whatever the legislation established, each State should work toward or shall work toward this level, and then within that, of course, there would be alternative ways of reaching those stated objectives.

Would this satisfy the desire for the need to have experimentation on a State-by-State basis which is, I understand, the rationale for your approach on the State-by-State basis?

Mr. WATKINS. I understand your proposal to imply that Federal legislation will be required at the end of this period of—end of this moratorium; is that correct?

Mr. SUTCLIFFE. Well, I am not certain that the legislation would require this. What you could do, as has been done in some other situations, is come back and take another look at it to see what the compliance has been. As to whether or not you have to at the end of the 3-year period to mandate that planning in the States that had not acted depends upon the kind of standards that are adopted and how easy it would be to judge whether the State had met those standards.

Mr. WATKINS. If I may be permitted, Senator Hart, you have given a tremendous amount of personal attention to this development over the past several years, and I would not be uncomfortable if the Almighty could guarantee that such a guiding hand would be continued over the next several years in this development, but I am fearful

of legislation being adopted now which suddenly has a way of becoming set in concrete, because I am convinced that this is such a new approach, it is so novel we are going to have to change with the the concept virtually month by month, if not year by year as it develops:

And I just have an inborn fear of legislation becoming concrete and we would have to live with what's in existence and also with the possibility that it may become a political football. Now, if—

Senator HARR. Thanks for your compliment, but I am trying to figure out whether it's easier to get the Congress to go back after it's jumped or whether it's easier to go forward step by step. Depending on which way you want it to go, you think it works better the other way?

Mr. SUTCLIFFE. Let me, sir, ask you, as the president of an insurance company that does a great deal of business in interstate commerce, what the practical implications for your company and perhaps other noninsurance businesses would be if you set up different laboratories to launch different experiments to test certain tenets of a no-fault concept that you have endorsed today.

The first question is: How many different forms would your company have to formulate to comply with the various plans that would go into effect in different States?

Mr. WATKINS. Actually, we are in the paper business now. In nearly every State, there is some particular clause that is required to appear in the policy which requires overprinting. As you probably know, every time you run a piece of paper through the printing press even if it's to change two words, it's expensive. So we wouldn't be in any different posture than we are now.

Mr. SUTCLIFFE. But one of the advantages we are trying to seek with a change in the system is reduction in operating costs. Is it a significant reduction?

Mr. WATKINS. No. Our printing cost is infinitesimal. We would still have to keep statistics. We would want to, on a territory by territory basis, to validate this experimentation process that we are speaking of.

In fact, even if we did have a common program countrywide, I am sure the country would be divided into zones, population districts and so forth, and we would have the same statistical problems and requirements that we have now and I think it would be a problem. Yes, it would be a problem.

Mr. SUTCLIFFE. You mentioned validating the different experimentations. How do you evaluate experiments? We had explained this morning two different plans that are being touted as no-fault plans; one in the State of Massachusetts which has been passed, and another being proposed in the State of Illinois.

A person knowledgeable as to contents of those plans explained that they were entirely different. One, in his opinion, was not a no-fault plan. Although it expanded first-party coverage it certainly had a rather difficult tort overload. I guess one of the validations that we are trying to find is, will operating costs be reduced? Will consumers therefore save in premium dollars? At the same time, will they be given a great deal more protection by their insurance policy in terms of compensation over what they presently receive? Do you run the risk of having experiments launched that are designed to prove that what you are testing for won't work?

Mr. WATKINS. Validation doesn't necessarily mean that what is being tested is proven to be feasible and useful. In other words, you can validate a failure. Specifically, if the validation says that a particular plan is no good, get rid of it. That in my terminology is a validation.

Mr. SUTCLIFFE. What if it turns out to be very good for insurance companies and very bad in terms of the amount of dollars that the consumer puts into it.

Mr. WATKINS. We are in one of the most highly competitive businesses in the United States. Also one of the most regulated at the State level. But we are in a very violently competitive business.

Mr. SUTCLIFFE. But as to each jurisdiction, you are each playing the same rules. So that you know if it turns out to produce expanded profits to the insurance companies the competition will be, how do we get the most people in that jurisdiction, not as to how you design the plan that is most beneficial to consumers.

Mr. WATKINS. I think you are making the assumption, Mr. Sutcliffe, that all companies will charge the same rates. I don't contemplate that. I think they will be competitive on rates and that in itself will be a lid on these profits, that the automobile insurance companies may make and which we haven't made for, lo, too many years.

Mr. SUTCLIFFE. It is not profits but the amount of expenditure of consumer dollars necessary to reach the kind of protection we all want that I am talking about.

Mr. WATKINS. There are two areas of benefit to the consumer. One, the premium he pays; and the other, what is returned to him in benefits. If the premium dollars is reduced from \$100 to \$80, and the public gets back in benefits, not in collection costs—if I can use that term, instead of lawyer's fees—65 percent, they are a lot better off because right now they are getting something less than 40 percent; some show as little as 14 percent out of that \$100, or \$14 out of the \$100.

So I feel very sincerely, that competition between insurance companies, the different types of insurance companies because as you know we have agency companies, mutual companies, we have direct writers, mail-order companies, that don't even have local agents. That type of competition, I think, will certainly control the price of the product. Particularly in those States where we have a free-rating climate.

Mr. SUTCLIFFE. I don't want to belabor the point. But let me take your analogy of a plan that returns instead of 45 percent on the dollar, 65 percent. Now, that enables you with the same collection of premium dollars to offer more benefits to the consumer.

Mr. WATKINS. Yes.

Mr. SUTCLIFFE. What if you take that plan and put it in one State and take another plan, which returns only 50 percent in benefits to the consumer. You see, we have developing now in Massachusetts a no-fault plan which has some cost added onto it because of something labeled "interinsurer subrogation."

We have suggestions for a similar type of overlay in Illinois. If our objective is to utilize to the best extent possible premium dollars to maximize the benefits payable, and avoid economic waste, be it expressed in terms of economic waste for the consumer or in terms of eating up profits for industry, how much of the costs should the American public be willing to pay for the privilege of experimenting as you advocate?

Mr. WATKINS. Well, I don't think I can answer that question in the way you asked it. I don't think that there would be plans—a plan returning only 50 cents out of the premium dollar—I think would fall of its own weight.

Mr. SUTCLIFFE. What if it straightened out another problem, as perhaps the Massachusetts plan has done by taking bodily injury claims out of the picture in PD cases, thus correcting an unusual situation there.

Certainly an apparent improvement in the system has been realized. And the systems might be one that the people may be willing to live with even though it increases the efficiency of the system from 45 to only 50 percent?

Mr. WATKINS. Are you assuming that the people in the State of Massachusetts are going to want exactly the same thing that the people in Arizona do?

Mr. SUTCLIFFE. I guess I have to make that assumption. I have lived in too many parts of the country to think that the needs of people in various States are different.

If I am injured in the State of Washington, I will have the identical kinds of needs in terms of payment for hospitalization, rehabilitation, and wage replacements that I will have if I were injured in the District of Columbia.

Mr. WATKINS. Proportionately, yes.

Mr. SUTCLIFFE. I might have to pay a little different cost for the insurance. But my needs, I think, would be pretty much the same.

Mr. WATKINS. Let me explain that I don't feel this experimentation period should go on ad infinitum. I hope—I hope that's clear. So we are not talking about something that is of long duration that is going to be continued in perpetuity.

I think very honestly that the bare facets of the various programs are going to surface rather rapidly. And as they surface, I think they should be identified and as soon as it's proven that they are feasible, workable, that it's what the public wants and it does relieve the pressure on the court system, that it makes more prompt reimbursement of medical expenses, it particularly encourages rehabilitation.

I think this is one of the most critical objections to the present system the fact that rehabilitation is so frequently negated because the poor person doesn't have the funds to take advantage of the remedial medical assistance that would save the use of his arm.

Consequently, after 6 months, why, it's irretrievably lost. The use of it is. The wealthy person has the means to finance that rehabilitation.

Mr. SUTCLIFFE. Have you given any consideration to how you appropriately draw the tort exemption line, you or your company? Because if these hearings are not going to produce Federal legislation they may serve as a guide to States that will be considering these important issues.

Mr. WATKINS. I cannot answer that in the affirmative, no. We have not put it down on paper. We have some pretty strong feelings in broad principle.

Mr. SUTCLIFFE. For the record, then, could you, if and when they are committed to paper, provide them to the committee?

Mr. WATKINS. I certainly will. In a nutshell we are purists. We believe in a pure compensatory system without any thresholds. In

other words, we follow Senator Hart's proposal that there will be unlimited medical reimbursement for incurred expenses and rehabilitation expenses.

Mr. SUTCLIFFE. What do you do with the intangible loss or the general damage?

Mr. WATKINS. We don't feel—we feel that that is a burden on society. If a person is made whole through prompt rehabilitation, through reimbursement of his economic losses, that fulfills society's obligation. This is true of workmen's compensation.

I am not holding up all the workmen's compensation laws as the model either. But I think the theory of workmen's compensation, the bold theory of workmen's compensation applies.

Mr. SUTCLIFFE. Would your company consider selling a first party policy to the individual on an optional basis to cover an intangible loss?

Mr. WATKINS. At this point I don't think we would. We might if competition forced us to. Again, let me emphasize, we are in a very competitive business. If we did, I feel sure we would want to have that intangible damage very carefully defined and limited to a fraction or a multiple of some readily identifiable expense.

Mr. SUTCLIFFE. Mr. Watkins, for the record, could you provide this committee with an estimate of the kinds of manpower training costs your company would have to engage in with different plans and different States compared to a uniform national plan of automobile insurance compensation?

Mr. WATKINS. Manpower training for underwriting?

Mr. SUTCLIFFE. For selling. I imagine there would have to be some difference there, for educating underwriters, for educating claims adjusters—those costs that might have to be incurred in the home office and in the jurisdictions in which you are writing if you had to market insurance under different plans. If we need clarification as to what we are after here, these can be just guesstimates. If it is not a valid question, please say so.

Mr. WATKINS. It is valid in some respects and we will certainly be glad to comply with your request. But companies that deal through independent agents, as does my company, have no control over those agents.

Mr. SUTCLIFFE. But you do provide them with information?

Mr. WATKINS. We provide them with information, but they are independent and they pride themselves in following their own educational patterns and their own devices. We can lead them to the trough but we cannot make them think.

Mr. SUTCLIFFE. I am sure they all do that anyway.

Mr. WATKINS. However, the principal concern would be in the area of loss adjustments which, of course, there would be no problem because it is purely first-party reimbursement and in the underwriting process.

But we will comply with your request. Be glad to.

(The following information was subsequently received for the record:)

At the present time we are handling a multiplicity of insurance plans and programs in the fifty state jurisdictions. Our best intelligence is that the staff, supported by our centrally-located Training and Development Department, should be able to handle the development of state-by-state No-Fault automobile programs.

While we believe economies would accrue in the preparation of printed material, we are unable at this time to identify any significant reduction in manpower training costs.

Mr. SUTCLIFFE. Just one other question. I did not note in your discussion the impact the construction of vehicles in a manner that would make them less susceptible to damage, might have on the cost of insurance.

We have before this committee legislation to establish property loss reduction standards for motor vehicles. Does your company take a position on that legislation?

Mr. WATKINS. We do not have technical support for such a position, but we do heartily endorse the concept that vehicles should be rated by their damageability. Now, how this is going to be established is another matter.

Mr. SUTCLIFFE. Do you think minimum levels of property damage susceptibility should be established by the Government that would mandate auto manufacturers to build their vehicles to comply with those minimum specifications?

Mr. WATKINS. I think it is in order for the Federal Government to establish safety standards; yes, sir.

Mr. SUTCLIFFE. And property loss reduction standards, bumper legislation?

Mr. WATKINS. This is what I call safety. Here again I think it is like going back to our discussion of no-fault, I think that guidelines could well be adopted and then if, in the course of a few years, those guidelines are not adhered to, then, by gosh, let's put some whip into them.

Mr. SUTCLIFFE. Thank you.

I have no further questions, Senator.

Senator HART. On that last point, I note in your prepared statement you expressed the belief that no-fault would lead to an expansion of the automobile insurance market and that underwriting standards would be changed significantly. Then you say "An individual's driving record would still be important, but so would his income, the size of his family, the kind of car he drives."

I assumed when I read that that you did agree with the question that Mr. Sutcliffe suggested?

Mr. WATKINS. In the main I do, sir.

Senator HART. Thank you again, both for your testimony and for the film. I hope there is very broad distribution of it.

Mr. WATKINS. Thank you, sir. I appreciate the opportunity.

Senator HART. Next the vice president and manager of the American Mutual Insurance Alliance, Mr. Andre Maisonnier.

I think it was in another committee, but I remember pleasantly hearing your testimony then.

**STATEMENT OF ANDRE MAISONPIERRE, VICE PRESIDENT AND  
MANAGER, AMERICAN MUTUAL INSURANCE ALLIANCE, WASH-  
INGTON, D.C.**

Mr. MAISONPIERRE. Thank you very much, Mr. Chairman.

My name is Andre Maisonnier, and I am a vice president of the American Mutual Insurance Alliance. We are a voluntary association of more than 100 mutual insurance companies which provide auto-

mobile and other property-casualty coverages in all 50 States and the District of Columbia.

We appreciate the opportunity of presenting our views to the committee. Since our oral statement very briefly summarizes our full statement, we respectfully request that the full statement will be made a part of the record.

Senator HART. It will be made a part of the record along with the exhibits.

Mr. MAISONPIERRE. We believe that the excessive human and economic losses resulting from auto accidents can be dramatically reduced. To this end, we have developed a reform proposal called the guaranteed protection plan which deals with all of the major factors contributing to high insurance costs and consumer dissatisfaction. This is a comprehensive approach to the automobile problem—an approach which calls for responsible reform in the automobile reparations system, in vehicle design, in driver performance, and in traffic safety regulations.

#### AUTOMOBILE DESIGN—KEY TO MAJOR INSURANCE SAVINGS

Automobile damage has become the dominant factor pushing up the cost of automobile insurance. About two-thirds of the total premium paid for a typical package of automobile insurance goes for coverage paid for vehicle repair or replacement.

Moreover, the cost of the vehicle coverages is now rising at an accelerating rate, while the cost of the bodily injury coverage is slowing down.

Rate filings made in a number of States over the past few months called for increases in the vehicle damage coverages of 10 percent to 20 percent or more, while the bodily injury rates remained the same or required minimal increases.

Thus, reducing crash damage to cars is the single most urgent priority in the alliance's guaranteed protection plan for auto insurance reform.

In prior testimony before this committee Dr. William Haddon, Jr., president of the Insurance Institute for Highway Safety, laid a firm foundation for congressional action to stimulate auto manufacturers to recognize the impact which fragile car designs has had in increasing the transportation costs of the American consumer.

Dr. Haddon's testimony covered a number of misunderstood points about low-speed crash problems. Among those, the following need emphasis.

(1) There is no necessary conflict between the goals of protecting automobile occupants from injury and protecting the vehicle itself from costly damage in collisions.

(2) Preventing low-speed crash damage will not automatically mean car price increases.

(3) Rear end damage is nearly as common as front-end damage—hence, protection of the rear of the car is just as important as protection of the front of the car.

(4) Low-speed test crashes and insurance data show that the bulk of property damage is produced by minor crashes.

Results of crash tests on 1971 models clearly indicate that presently available technology to reduce automobile damageability continues to be ignored in the design and manufacturing of automobiles.

On the other hand, improvements in vehicle design already are helping to reduce crash injuries and to minimize the cost of the economically less significant bodily injury coverages. Similar dedication to reducing car fragility would go a long way toward actually reducing the cost of automobile insurance.

#### PROPOSED REFORMS IN THE AUTO REPARATIONS SYSTEM

The guaranteed protection plan also calls for major reforms in the auto reparations system. These reforms are designed to achieve a reasonable balance among three difficult and often contradictory goals:

1. To provide crash victims with prompt and fair compensation.
2. To encourage driver responsibility.
3. To keep overall costs at a reasonable level.

Our statement describes the plan in detail. Let me merely outline some of its proposals.

The plan would require that every private passenger automobile policy issued or delivered in the applicable State shall include as minimum benefits, payable regardless of fault:

1. Medical and hospital expense coverage up to \$2,00 a person.
2. Disability income coverage of 85 percent of gross income lost during a period commencing 30 days after the accident.

Insurance companies would, of course, be permitted to offer broader coverages than the statutory minimums.

The guaranteed protection plan would retain existing liability protection. Persons with losses exceeding their first-party, no-fault benefits would be entitled to compensation from the other driver for such losses. But insurance companies which pay the medical and disability benefits to their own policyholders could seek reimbursement from the party at fault or his company.

Thus, the proposed system would be no-fault in the sense that the accident victim would collect for his basic economic losses, regardless of who caused the accident. But it would be a fault system in the sense that it would preserve the principle of personal accountability.

In order to simplify the payment of both fault and no-fault benefits, the plan calls for the compulsory arbitration of all liability claims under \$3,000 and an intercompany arbitration system to handle all subrogation matters.

The guaranteed protection plan sets an objective standard for determining general damages—those damages which go beyond the accident victim's out-of-pocket economic losses.

Payment for these damages would be limited to a proportion of medical and hospital expenses incurred. Such limits are intended to curb nuisance claims and to offset the cost of extending the basic no-fault benefits to accident victims generally.

These limits do not apply in cases involving death, permanent disfigurement, dismemberment, permanent impairment, and in other exceptional circumstances where the court or jury finds such a limitation to be unjust.

In addition, the plan would require the adoption by the States of comparative negligence laws. To the extent that the operation of the contributory negligence rules sometimes produce a harsh, unjust re-

sult in individual cases, the proposed reform would eliminate these inequities.

To reduce excessive attorney fees our plan calls for placing a limitation of 25 percent on such fees where they are contingent on the amount awarded the person represented by the attorney.

To protect car owners against unwarranted cancellations of their auto insurance the guaranteed protection plan calls for passage of legislation limiting permissible reasons for cancellation of private passenger auto insurance policies to nonpayment of premium or suspension of driver's license or vehicle registrations.

In addition, specific requirements with respect to the insurer's intention to cancel or not renew are provided in the plan.

#### GUARANTEED PROTECTION PLAN: COMPATIBILITY WITH DOT RECOMMENDATIONS

There are many points of similarity between the insurance reform portion of the guaranteed protection plan and the program recommended by the Department of Transportation. There are, also, some basic differences between the two approaches. Let me briefly outline these for you.

We agree with Secretary Volpe that the States should move promptly to experiment with reform plans extending to auto accident victims—on a first-party, contractual basis—basic benefits to be paid to all accident victims without regard to fault.

The benefits paid under the guaranteed protection plan would cover in full the wage and medical losses incurred in more than 95 percent of all auto crashes.

The alliance proposal is consistent with the Secretary's suggestion that the States might want to experiment initially with the reform plan that would offset the cost of first-party coverages by the savings achieved in revising the rules on general damages.

Under our plan, such cost savings would be produced by imposing limits on the amount of general damages that could be collected for injuries not involving death, disfigurement, or permanent impairment.

We specifically endorse the administration's findings that the Federal assumption of the regulation of the automobile insurance business is highly undesirable.

Our differences with Mr. Volpe have to do primarily with matters of timing, and of defining what constitutes radical, irreversible change.

Mr. Volpe argues persuasively in his testimony that there is an urgent need for experimentation at the State level to clear up major uncertainties about the cost, workability, and public acceptance of any new system.

Having established that major uncertainties exist, very little credibility can be given to the DOT's proposal since it goes beyond the point of no return in the first stage of implementation.

We believe that the guaranteed protection plan offers crash victims better benefits and would allow for a more orderly testing of public sentiment than the Administration's program.

The people affected by changes in the reparations system need to be able to see and make judgments about what they would gain and lose as the balance is shifted towards greater use of no-fault coverages.

**GUARANTEED PROTECTION PLAN: COMPATIBILITY WITH MOTOR VEHICLE  
INFORMATION ACT**

For the past few years the alliance has supported State legislation bumpers. We believe, however, that minimum Federal standards in this area would be desirable. Accordingly, we strongly endorse Federal legislation which would give the Department of Transportation authority to issue standards aimed at making cars more crashworthy.

We question, however, the desirability of section 5(c) of S. 976. We find it very difficult to understand delaying action until 1975. Each year's delay in enacting adequate standards penalizes the insurance cost for a whole generation.

Since the average life of a car is about 10 years, it would not be until 1985 that all cars on the road would be equipped with adequate bumpers if this section is allowed to stand as it is.

We believe that there is every expectation that the Congress should require a total vehicle design capable of withstanding rear and front impacts at 5 miles per hour into a solid barrier by 1973. Unless this is done, the Federal law will invalidate stronger State laws already on the books in Florida and Maryland and will give auto manufacturers a 2½-year umbrella during which time they need do nothing about providing adequate bumpers and more damage resistant car designs.

We support the requirement that auto manufacturers test their new models for crash resistance and publish the data so that potential purchasers can use this information in their buying decisions. This would encourage insurers to rate the various makes and models on the basis of their damageability and ease of repair.

We urge the enactment of legislation calling for periodic inspection and reinspection of damaged vehicles. The finds of the recently released California Highway Patrol's investigation of fatal single-car crashes makes such inspections imperative.

The reinspection of automobiles following crashes may bring about some additional insurance cost, since insurers will not be entirely successful in sorting out the maintenance repairs from the crash damage. However, we feel that such costs would be justified by the ensuing increase in safety.

We also support the uniform title registration program covered under title V of the bill. Over the years we have urged the States to adopt the auto title registration program of the National Committee on Uniform Traffic Laws and Ordinances.

Statistics clearly indicate that in States which have adopted this program, fewer automobiles are stolen and more stolen cars are recovered. Obviously, a substantial reduction in thefts or a substantial increase in the recovery rate would be reflected by a reduction in premium rates for theft insurance.

We want to stress our basic endorsement of the purpose of S. 976. Although our specific objections are substantive, we believe that with suitable amendments this bill can be of major assistance in bringing under control the excessively high price now paid by consumers for auto crashes and for the insurance coverages they pay for crash damage.

**GUARANTEED PROTECTION PLAN; COMPATIBILITY WITH CONSUMER  
ATTITUDES**

One of the major considerations involved in assessing the practical and political feasibility of any new automobile reparations system is public acceptability.

In designing the guaranteed protection plan, the Alliance has conducted major research on public attitudes and has tailored its various proposals accordingly. All of the available evidence indicates that the American public attaches considerable importance to the concept of driver responsibility for injury done another.

This was demonstrated in a major national study of the attitudes and feelings of people who buy auto insurance, conducted by Market Facts, Inc., largest consumer survey organization in the Nation. The survey is described in detail in our prepared statement. Let me just cite a few of the pertinent findings.

1. Auto accident victims who have been injured by a negligent driver are unwilling to give up the legal right to collect for general damages.

2. Six out of ten consumers are opposed to pure no-fault auto insurance. Among those who have had experience with the existing claim payments system, almost two out of three were opposed.

3. About two-thirds of the consumers interviewed felt that making automobile insurance excess over other benefits would not be too good an idea.

In addition to this public attitude survey, the Alliance conducted an actual field experiment over a 12-month period in the Syracuse-Rochester areas of New York and in several counties on the western edge of Chicago.

The objective was to test injured claimants' receptivity to a program guaranteeing them prompt but reduced benefits.

The 16 participating companies, representing a broad section of the auto insurance business, offered third-party bodily injury liability claimants a choice of collecting all of their medical expenses up to \$5,000, plus wage benefits equal to 105 percent of their losses, to be paid promptly as their losses accrued. Or they could reject this alternative and pursue a regular liability claim.

The major finding of this experiment was that, given a choice between a guaranteed offer and the payment available under the existing auto liability system, only 25 percent of the eligible claimants elected to accept the alternative benefits in Illinois, and 15 percent in New York.

Confirming this apparent public attachment to the present liability system is the response found to a question in DOT's own public opinion survey. The question was: "In your opinion, is there a need to change the system? In what ways?"

More than two-thirds—78 percent of all respondents—did not express a preference that the system be changed. See pages 6 of exhibit 3.

**UNIFORM MOTOR VEHICLE INSURANCE ACT**

One of the important shortcomings of this proposal is its incompleteness. The bill leaves many questions unanswered. The public is not being well served by being left in the dark by these unresolved issues.

There is wide appeal to a plan which seemingly offers something for everybody with no controversy. But, it is the responsibility of this committee not only to examine these promises but also to examine the unresolved problems created by the proposal.

For instance, what rates would be charged for the compulsory coverages? What additional coverages would be needed and what would they cost? What cost would have to be paid out of the pockets of accident victims and which claims would not be paid under the proposed new form of insurance?

We know that 55 percent of the persons injured in auto crashes are not wage earners at the time of the accident. Many of these persons expect to enter or reenter the work force at some future date.

Under the Uniform Motor Vehicle Insurance Act these people would have no way to collect for any harmful effects an auto injury might have on future earning capabilities unless they sustain catastrophic harm. This inequity is even more severe in the case of the unemployed.

The bill does not state how disability is to be defined. Nor how the extent and duration of this disability is to be measured. And, what is meant by "disfigurement"?

The bill will fall far short of its sponsors' expectation of providing "almost total compensation" for the seriously injured. Although the bill preserves the right of total recovery for those who are more than 70 percent disabled, this remedy is made largely meaningless by other provisions of the bill which would prohibit the States from requiring drivers to carry any form of liability insurance to pay for such losses.

Additionally, the bill creates serious inequity for the much larger group of seriously injured crash victims who suffer permanent disabilities below the 70 percent level. These victims would receive no compensation at all for going through life with some rather serious impairments.

It is argued that general damages should be excluded from compensation because they are subjective in nature and are not susceptible of precise measurement in dollars. Yet the same thing is true of a great many things in this world.

What is a man's time worth, and how is its value determined? How do we determine the value of a piece of real estate condemned for a highway?

All these things are subjective in nature. Yet we manage to translate them into dollar amounts by the process of bargaining and compromise.

In fact, under the Uniform Motor Vehicle Insurance Act, very large numbers of auto accident victims would receive nothing at all even from the compulsory personal injury coverages. Nobody would collect for damages inflicted on his automobile under the statutory coverages. Many of those who have wage continuation plans, health insurance protection, et cetera, would not collect anything for their wage and medical losses, either.

No doubt it will be argued that these losses are covered by other benefit systems. But the same argument can be made today.

The point is, both the present statutory auto insurance coverages and those proposed under this Federal bill are designed deliberately to leave out certain categories of claimants. And the group left out is

much larger under the Federal proposal than under the present system or under the guaranteed protection plan.

Another unfortunate shortcoming of the Uniform Motor Vehicle Insurance Act is the damage it would do to one of the Nation's major industries by abolishing State regulation of insurance and superimposing a system of Federal regulation under the Secretary of Transportation.

There is nothing in the history of the Federal regulatory system to instill confidence that the Federal regulation of insurance would be, on the whole, more efficient than the present State regulatory system.

The *Congressional Record* is full of official and unofficial criticism of Federal regulatory agencies for dilatory procedures, their inflexibility, their lack of independence and competency.

Insurance remains one of the most diverse businesses in the Nation. In most respects it is still a local business, built on local bases and solving local needs. The alliance believes that the regulation of insurance must recognize and respond to this diversity.

One of the politically popular features of the Uniform Motor Vehicle Protection Act is the provision which would require auto insurers to accept all applicants for coverage, provided they have a valid driver's license and are willing to pay the premiums.

The most likely result of this would be to increase the cost of insurance for a vast majority of drivers who now enjoy preferred rates, since companies which attempt to set their rates at a lower level to attract such drivers would be inundated by high-risk drivers.

The guaranteed protection plan deals with the problem of insurance availability in a more reasonable fashion. It calls for an expansion of the present automobile insurance plans so as to guarantee reasonable limits of protection for both liability and auto insurance coverages to every licensed driver.

#### CONCLUSION

The problems generated by automobile crashes are far more complex than was generally realized when the reform issue first came to the general public's notice.

We believe that the ensuing research, debate, and soul searching has been productive, and has produced something close to a consensus on the steps that must now be taken to bring about a reformed system and to bring under control the excessive losses.

The alliance has been privileged to play a major role in the search for reform. We pledge to you and to the public our sincere efforts to accomplish these objectives.

This, Mr. Chairman, completes my oral statement.

Senator HART. Thank you very much, particularly for the skill you used in summarizing a very long and useful paper.

I would want to comment about that bumper standard section of S. 976. We will want to take a look at that language, I agree with you. Whether it prevents anybody establishing the standards before the date required, January 1975, it was not intended to do so.

Mr. MAISONPIERRE. That is right, sir.

Senator HART. You cite public opinion surveys to establish the proposition that with respect to the elimination of pain and suffering

informed citizens say no, don't eliminate it. You suggest that we should respond to that wish. Then, you say just because it is politically popular to prohibit cancellation or to compel writing we shouldn't necessarily follow what is popular.

Mr. MAISONPIERRE. I would like to answer this if I may.

We believe that this program which I stated to be politically attractive is politically attractive because many individuals who have supported this proposition do not really understand the far-reaching consequences that such a proposal might have. Once this is explained to them, once the straitjacket to which the industry is really placed under a proposal of this nature is explained to many of the supporters of this proposal, there is, then, a realization that perhaps its attractiveness is superficial and doesn't go to the depth of the problem.

Senator HART. You have helped us before and I am sure when we have an opportunity to inhale the full paper, we will find there is much that is helpful.

Mr. MAISONPIERRE. I apologize for the length, Senator.

Senator HART. No, it will be very helpful. We are today where we were when we last visited, trying to figure out a better delivery system. We now use the figure \$14 billion a year in premiums with economic losses substantially greater than the total benefits that are paid out. We are meeting again to discuss how we can better provide for the public with insurance benefits and understand the existing system.

Mr. MAISONPIERRE. This is right, sir. We have been studying this over a period of years, and this program I described to you, the guaranteed protection plan, we believe will bring about a better distribution of the benefit system, will certainly bring about substantially greater reimbursement for economic losses for accident victims; we expect it will bring about a substantial diminution in the benefits paid where we think that there is abuse. This is in the so-called minor cases, and, of course, minor is relative, and we believe the program, by bringing about certainty of recovery for all accident victims, by reducing the payout in the small cases, hence also reducing the attractiveness of pursuing lawsuits in the small case, will bring about a better distribution of the benefits.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. Thank you, Senator.

Mr. Maisonpierre, in your testimony on automobile design as a key to major insurance savings, I understand that you endorse S. 976, particularly in its authorizing the Department of Transportation to set property loss reduction standards. Is that correct?

Mr. MAISONPIERRE. This is right.

Mr. SUTCLIFFE. I understand that you ask the committee to look very closely at the preemption provisions that would be included in any such legislation.

Mr. MAISONPIERRE. Yes. I am very concerned, Mr. Sutcliffe, and if I may, I would like to indicate that we support very strongly the Maryland bill.

Mr. SUTCLIFFE. This is the Maryland bumper bill?

Mr. MAISONPIERRE. The Maryland bumper bill.

Mr. SUTCLIFFE. This was a 5 mile per hour front and rear standard?

Mr. MAISONPIERRE. To be effective January 1, 1974. The bill went through the legislation and it is now before the Governor. The Gover-

nor is holding hearings tomorrow, I believe, to see whether or not the bill should be vetoed.

There is the argument that the latest bumper standards issued by the DOT have in fact already preempted any State action in this area and hence the Governor should veto the bill.

Mr. SUTCLIFFE. Were those bumper standards of the Department of Transportation based upon the authority to develop motor vehicle safety standards?

Mr. MAISONPIERRE. That is right.

Mr. SUTCLIFFE. As distinguished from property loss reduction standards?

Mr. MAISONPIERRE. That is right. The argument is being made even though the purpose of the two standards really are different, the one is aimed at safety, the other at damageability, these purposes are different. The argument is being made that the standard issued by DOT about 3 weeks ago have already preempted all State action in this area.

We will appear before the Governor strongly supporting the point that there is no preemption. We do not believe there is such a preemption.

Mr. SUTCLIFFE. As to the diagnostic inspection requirements in S. 976, do I understand you to favor those as incorporated in the bill?

Mr. MAISONPIERRE. We believe that these are very, very important, Mr. Sutcliffe. In fact, Senator Hart, we appeared before you about 2 years ago when we talked in terms of postaccident inspection and reinspection. At that time we opposed a Federal provision or any provision requiring the reinspection of automobiles after accidents. We opposed this on the basis that we did not think that the reinspection programs or the inspection programs pursued by the States were sufficiently sophisticated to support the cost of reinspection after crashes.

However, this program which is described in S. 976 gives us the confidence that the reinspection program will be very much more thorough and will bring about the type of improved automobile safety which is needed on the highway. But, we think for this to come about, we need to have the inspection mechanism which you have described, Mr. Sutcliffe.

Mr. SUTCLIFFE. The diagnostic inspection?

Mr. MAISONPIERRE. Yes.

Mr. SUTCLIFFE. As you understand it, would this require construction of vehicles to be susceptible to diagnostic inspection?

Mr. MAISONPIERRE. Yes. It will require both. The vehicles must be properly equipped so that the centers can get the information adequately.

Mr. SUTCLIFFE. What impact would the uniform titling provisions in S. 976 which you also endorse have upon insurance cost?

Mr. MAISONPIERRE. Well, the two major States which have not adopted the uniform title and registration law are New York and Massachusetts. Those are two States which have a huge amount of vehicles, two States where both the rate of theft is high, very high, much higher than nationwide, and the rate of recovery much lower than nationwide. Obviously, the impact will be felt primarily in those two States—New York and Massachusetts.

To the extent that we are going to be able to reduce insurance losses, theft losses, we are going to be reducing the impact on auto insurance cost. I cannot give you any exact figures, but automobile theft in both States have had serious impact on the automobile insurance rates in those States.

Mr. SUTCLIFFE. Have estimates been made of the amount of insurance payout for those States and, if so, could you provide them for the record?

Mr. MAISONPIERRE. I would like to provide this for the record.

(The following information was subsequently received for the record:)

AMOUNT OF INSURANCE PAYOUT IN NEW YORK AND MASSACHUSETTS  
RELATED TO AUTOMOBILE THEFT

The amounts of insurance benefits paid out in those two states for the calendar year 1969 (latest available figures) are as follows:

	<i>Millions</i>
New York -----	\$89
Massachusetts -----	17

Mr. SUTCLIFFE. Mr. Maisonpierre with regard to point about automobile design keyed to major insurance savings—how is this committee to be assured that savings that may result from better bumpers and for proper inspection and for uniform titling will be passed on to the consumer and not retained by insurance companies?

Mr. MAISONPIERRE. Perhaps, Mr. Sutcliffe, if I may, I would like to bring some specific examples of what is presently going on. As my statement indicates, we feel that we are reaching a payoff in the safety standards. We are convinced that the standards have had strong impact on reducing both the number and the severity of accidents on the highway.

Let me introduce some rate filings which have been approved in a number of States as they relate to the bodily injury liability rates which are of course affected by the safety standards and the property damage liability rates which, of course, are unaffected by Federal standards.

In the State of Illinois there was no change in the bodily injury liability rates and there was a 13.9 percent increase in the property damage liability rate.

Idaho had a 13.6 percent decrease in bodily injury liability rate and a 19.9 percent increase in property damage liability rate.

Nebraska had a 2.3 percent increase in bodily injury liability rate and a 32.5 percent increase in property damage liability rate.

New Jersey had 0.1 percent in bodily injury liability, and a 23.6 percent increase in property damage liability.

South Carolina had a 3.5 percent increase in bodily injury and a 34.7 percent increase property damage liability.

Maine had a 4.1 percent increase in bodily injury liability rates and a 32.9 percent increase in property damage liability rates.

I think that this indicates that where there are ways to either reduce or control the cost of insurance to the public these costs are passed on to the public.

On the other hand, when we are at this stage in no position to control the cost because the damageability of cars, the public is just paying horrendously for this lack of control.

**Mr. SUTCLIFFE.** So, your suggestion is the rating system of the several States would factor in any savings resulting from property loss reduction standards when determining rates for insurance companies?

**Mr. MAISONPIERRE.** That is right.

**Mr. SUTCLIFFE.** And this would be perhaps established under the auspices of the National Association of Insurance Commissioners as a standard operating procedure in rate filings?

**Mr. MAISONPIERRE.** Yes, this is right. In fact, this is what is really happening today.

**Mr. SUTCLIFFE.** I understand the figures that you have read and I understand the point you make.

Another interpretation of those figures, however, on the basis of the Department of Transportation's study would be that we are continuing to take better care of our cars than we are the bodily injury claimants. In other words, the rate reductions or the failure to achieve justified rate increases was on the basis that the payout in the bodily injury area was constricted.

Although I do appreciate those figures and realize what you are trying to represent by them, I must be somewhat suspect as to whether or not that the reason for the maintenance of the rate or the lowering of the rate was the one you ascribe.

**Mr. MAISONPIERRE.** If I can address myself to this, in those States which I have mentioned to you there has been no appreciable change in the law except perhaps Illinois and Maine which comes to mind where we have come to a comparative negligence system. So, we have broadened the opportunity for paying accident victims. Yet, we know that the periods covered by these rates are the periods which have witnessed the fastest rise in medical care in the history of our Nation.

So, the ingredients that make up these bodily injury liability rates have gone up at a rate higher than ever before, and yet the rates have remained fairly stable, or as in Idaho, I stated 16.9 percent decrease. There has been no change in the law to decrease the amounts of benefits or economic loss reimbursement to the injured people.

**Mr. SUTCLIFFE.** I think the only thing I was suggesting was that the payout experience could result from the fact that, you are not having as many losses because of improved safety features on highways, or, the claims are on the increase but payment for those claims is not being made. That is the only point I wish to make.

I recognize that all costs in terms of attorney's fees, doctor's expenses, adjustments—all service costs—are dramatically on the rise and are not susceptible to any kind of technological advance. I just want the record to suggest that there may be more than one cause for the situation which you describe.

**Mr. MAISONPIERRE.** We do know that any way you measure it, the number of fatalities last year has gone down, and this I think is a measure of the number of serious bodily injury accidents caused; and this number, I think, reflect the number of bodily injury claims which are received.

**Mr. SUTCLIFFE.** That was even true, was it not, with an increase in the number of vehicles on the road and miles driven?

**Mr. MAISONPIERRE.** Yes, this was the first year I believe over a long period of time that there was an actual reduction in the number of

fatalities in spite of the fact that we have had an increase in the number of cars, and so forth.

Mr. SUTCLIFFE. Mr. Maisonpierre, as to your guaranteed protection plan and the proposals to reform the reparations system, could you provide us with the percentage of injured accident victims that you have calculated would be covered by the basic benefits provided in your plan?

Mr. MAISONPIERRE. Yes, I would be glad to do this.

(The following information was subsequently received for the record:)

PERCENTAGE OF INJURED ACCIDENT VICTIMS WHO WOULD BE COVERED BY THE BASIC BENEFITS PROVIDED IN THE GUARANTEED PROTECTION PLAN

The Guaranteed Protection Plan would require that every private passenger automobile insurance policy contain at least \$2,000 in medical coverage and at least \$6,000 in disability income coverage.

Table IV-2, Department of Transportation's Automobile Personal Injury Claims Study, indicates that 98.5% of all accident victims suffer economic losses of \$5,000 or less, and 99.6% of accident victims sustain economic losses of \$10,000 or less. Thus, a program paying \$8,000 economic loss benefits would cover in full the economic losses of more than 99% of all accident victims.

COMPARISON OF THE GUARANTEED PROTECTION PLAN WITH THE PRESENT SYSTEM

When attempting to project the cost of any new reparation system, the following points must be emphasized:

1. *It is impossible to quantify the effects which changes in reparation systems are likely to have on losses*

As we have already indicated, the present reparation system, through the insurance mechanism, plays an important role in reducing the total losses arising out of the operation of automobiles. Although this loss reduction has never been quantified, it nevertheless exists. One can only assume that the impact of this loss reduction mechanism will diminish as the reparation system moves away from fault.

However, the major impact of changing the reparation system on society consists of redistribution of who will bear what losses. S.945 would, for the most part, require that those who have suffered losses will pay a greater share of the total incurred automobile accident losses. The present system and the Guaranteed Protection Plan, on the other hand, would continue to bear down hardest on those who have caused the losses, on the theory that the system should recognize as a matter of equity that the good drivers should not subsidize those who abuse the privilege of driving.

Additionally, it should be noted that reduction of automobile insurance premium costs does not necessarily reflect a reduction in the total incurred losses nor a net reduction of cost for individual car owners. Automobile insurance premium costs can be reduced by increasing the amount of self insurance which car owners or injured are required to absorb. Thus, a reparation system which contains many benefit gaps may, at first blush, appear to the automobile owner to be a cost saving in that his premium will be lower. But, when that same owner is involved in an accident and has to dip into his savings to cover his losses because of inadequate insurance coverage, the reparation system, will in fact, have turned out to be much more costly to him.

Each of the reparation systems which have been proposed to date would pay for the losses arising out of automobile accidents through a mixture of automobile insurance, insurance other than automobile, such as health, social security, etc., and self insurance. The Guaranteed Protection Plan attempts to minimize the dependency on self insurance and other insurance systems. It seeks to internalize the cost of automobile accidents by incorporating the loss components within auto insurance. This is, of course, highly desirable so that by pinpointing the cost of accidents, society can make informed decisions on how to best structure the transportation system. S. 945, on the other hand, externalizes many if the costs associated with auto accidents by passing on those costs to other insurance systems and

by requiring victims of accidents to self insure substantial portions of their losses. Thus, superficially it might appear as though S. 945 "costs less", when in reality it redistributes automobile accident losses in a very unfair way—by asking those least able to pay for the losses, accident victims, to foot a much higher proportion of the losses.

**2. When pricing a new insurance system, people's behavior will vary depending on the insurance systems in force**

Because it is impossible to accurately predict behavioral pattern changes under different reparation systems, one invariably assumes that there will be no change when attempting to project costs of new systems. This is a false assumption. We know, for instance, that the cost predictions relating to both the federal Medicare and Medicaid programs were grossly understated because changes in people's behavior were not considered at the time the original cost projections were made. Obviously, the greater the departure from an existing insurance system, the greater the changes in society's behavioral patterns and the less dependable are cost projections.

The Guaranteed Protection Plan borrows a great deal from the past and one can assume that people's behavior under Guaranteed Protection will be fairly similar to their behavior under the present system. However, S. 945, and other such radical proposals, expose the public to entirely new reparation systems. One should expect that auto accident victims will resist being paid substantially reduced benefits and that much greater use of the insurance mechanism will be made than is anticipated by the planners of those new systems. This will, of course, frustrate attempts at reducing the cost of automobile insurance.

In spite of these costing difficulties, we have arrived at Cost-Benefit projections of the Guaranteed Protection Plan and we have compared those to the present system.

We believe that automobile insurance premiums for the year 1970, assuming all the states had enacted the Guaranteed Protection Plan, would have run to \$10.4 billion. This is compared to the present system's premium of \$12.9 billion, or a reduction of 19%.

As to the auto accident victims' net recoveries, in 1970, again assuming the enactment of the Guaranteed Protection Plan in all 50 states, this would have run to \$6.7 billion as compared to \$7.7 billion under the present system, or a reduction of 13%.

It should be noted that the Guaranteed Protection Plan would reduce consumers' automobile insurance premiums more than the losses paid to accident victims. This is the result of efficiently structuring Guaranteed Protection so to reduce company administrative expenses. In fact, Guaranteed Protection would decrease company expenses in the area of bodily injury insurance by nearly 10%.

The lower net recoveries under Guaranteed Protection, are due entirely to the fact that improved bumper assemblies capable of withstanding 5 mph front or rear collision without damage other than the expense of refinishing, will reduce both losses—hence, recoveries by 21% or \$850 million.

Comparing the Guaranteed Protection Plan with the present system, we believe that the following changes will likely occur if Guaranteed Protection is enacted in all 50 states:

A 21% reduction in insured vehicle damage ultimately when all cars have proper bumpers.

A four-fold increase in first-party benefits under bodily injury insurance.

More than 2% reduction in plaintiff-attorney fees.

A 1/2 reduction in total insurance company expenses and overhead for bodily injury insurance.

A 40% reduction in payments for pain and suffering.

Nearly a 20% increase in bodily injury payments for economic losses to those who are not recovering any benefits under the present system.

**Mr. SUTCLIFFE.** Do you have any rough estimate?

**Mr. MAISONPIERRE.** About 95 percent.

**Mr. SUTCLIFFE.** You point to the fact that driver responsibility would be retained. Is this through the tort mechanism?

**Mr. MAISONPIERRE.** It would be a combination of two ways. Basically, it would be a tort mechanism. Of course, the payment of the

first-party no-fault benefits would ultimately be assessed against the responsible driver through an intercompany arbitration procedure.

Mr. SUTCLIFFE. It would be assessed to the company insuring that driver; is that correct?

Mr. MAISONPIERRE. It would be assessed against him and against his class and against the individual in the long run.

Mr. SUTCLIFFE. The individual in the long run through the payment of premiums but not as to the particular instance?

Mr. MAISONPIERRE. That is right.

Mr. SUTCLIFFE. So in many respects it is parallel to the inter-insurer subrogation provisions of the Massachusetts no-fault law?

Mr. MAISONPIERRE. To a large degree it does, Mr. Sutcliffe.

Mr. SUTCLIFFE. Do you mandate arbitration?

Mr. MAISONPIERRE. We mandate arbitration, and if I can explain. What we are contemplating is an expansion of an arbitration system which the industry is already using very extensively in the property damage area. I can describe this, it will just take a second of the committee's time.

This is a program which is administered by the companies. In the property damage area it is voluntary to the extent that a company does not have to become a signatory to the arbitration procedure, but 500 companies have become signatories to the procedure and once they have become signatories they must then abide by the arbitration proceedings.

Approximately 157,000 cases are handled this way a year, with about 50-some odd million dollars in losses being exchanged every year. The cost to arbitrate such cases will vary from about \$3.50 to \$7.50 depending on the locality.

Mr. SUTCLIFFE. May I interrupt there and ask you whether or not in that arbitration the consumer, the policyholder is involved at all?

Mr. MAISONPIERRE. No, he is not. The arbitration is done for the most part, I would say 99 percent of the time, by a filing of the files. The files are filed with the arbitrators. Occasionally, in difficult cases there may be an appearance by a company representative.

Mr. SUTCLIFFE. But not the policyholder?

Mr. MAISONPIERRE. The policyholder is not involved.

Mr. SUTCLIFFE. Do you anticipate that that would be the procedure followed in the bodily injury claim?

Mr. MAISONPIERRE. Yes, we would.

Mr. SUTCLIFFE. You would not ask the consumer to appear?

Mr. MAISONPIERRE. No, we would not.

Mr. SUTCLIFFE. How would you notify the consumer that he was at fault then? Under the property damage situation, do you notify him that he was found to be at fault?

Mr. MAISONPIERRE. I cannot speak for all companies. I can only speak for two companies whose procedure I know. The companies will send a card to the insurer advising the insurer of the disposition of the claim.

Mr. SUTCLIFFE. That will include the fact that he had been found at fault?

Mr. MAISONPIERRE. I cannot say exactly whether it would.

Mr. SUTCLIFFE. For the record you might.

(The following information was subsequently received for the record:)

**PROCEDURES USED BY INSURERS NOTIFYING POLICYHOLDERS THAT A PROPERTY DAMAGE LIABILITY LOSS HAS BEEN PAID ON THEIR BEHALF**

The procedure varies extensively among companies. Some companies notify their policyholders of the payment of the loss, at the time of the payment of the loss and some do not.

However, the policyholder is always made aware of the payment of the loss at the time of receipt of the policy renewal notice and statement. This notice reflects the "chargeable accidents" which affect the policyholder's premium.

**STATUS OF INSOLVENCY CLAIMS IN ARIZONA AND CALIFORNIA**

The attached letter dated April 26, 1971, reports on the liquidation progress of the insolvent Key Insurance Exchange, California and the Liberty Universal Insurance Company's insolvency in Arizona.

**Mr. SUTCLIFFE.** The reason I think this is important for the record is you are calling this a way of retaining driver responsibility, and unless the driver is informed that he is found to be at fault and knows why he is found to be at fault, you can't even pretend that there is a deterrence value.

**Mr. MAISONPIERRE.** Of course, the driver knows whether or not he is at fault. It depends whether he recovers on his own car. If his car is damaged and he does not recover himself, he knows that he is at least at fault. It may not be an indication that the other party is at fault, but he is at some fault.

**Mr. SUTCLIFFE.** You mean neither party is oftentimes paid for their collision and then the companies go through a subrogation proceeding?

**Mr. MAISONPIERRE.** No, because whenever an arbitration proceeding has been handled, it also takes care of the individual's deductible. In other words, the company will collect a deductible for its own insureds and it will pay its insured the deductible back.

So, it is the mechanism through which the insured can collect his deductible.

**Mr. SUTCLIFFE.** I am simply trying to explore how driver responsibility is built into the interinsurer subrogation concept that you have presented us.

First of all, the DOT study is very skeptical of the ability to deter accidents through insurance, but even assuming that there is a class of people who can be deterred, I think it would be appropriate to ask how through a communication which would have to be made in the bodily injury situation, because you don't have the care there, the person is found to be at fault.

Do you understand that question?

**Mr. MAISONPIERRE.** Yes, I understand this. I would like to inject this one thing. The DOT report, if I remember correctly, said that it had not been able to measure the trend that the present system brings about greater highway responsibility and there is deterrence in the present system.

**Mr. SUTCLIFFE.** We will, for the record, include at this point, with the permission of the Senator, the appropriate language of the Department of Transportation report.

(The information follows:)

**EXCERPTS FROM THE DEPARTMENT OF TRANSPORTATION REPORT**

Unfortunately, the claim of a significant deterrent effect for the present automobile liability insurance system has so far proven unsusceptible to substantiation by empirical evidence. Nor does significant evidence exist to support the

common belief that most accidents are caused by improper and avoidable human error. Two investigations conducted during the course of the Department's study, however, indicate that most accidents are caused by environmental or personal factors which are external to the individual's conscious control and that punishment or its threat, therefore, is ineffective as a deterrent to deviant driving behavior.<sup>1</sup>

Analyzing the deterrent effects of various measures, including those of the tort liability system, one of these studies notes that existing deterrent measures fail to distinguish between two groups of drivers: those who are unwilling to conform to "normal" driving behavior and those who are willing but unable to conform.<sup>2</sup> The "won't conform" group consists of motorists who willfully choose to violate traffic laws—who are able to modify their "bad" driving, but do not do so. Included in this group are those individuals who by virtue of their membership in deviant subgroups, are more likely to conform to deviant norms than to conventional driving norms (for example, certain youthful operators). For these relatively few drivers who deliberately choose to ignore safe driving practices, the threat of punishment will not, by itself, motivate careful driving behavior.

Motorists falling in the "can't conform" group attempt to exercise reasonable care when driving but, at times, are unable to do so.

"Some drivers are chronically unable to perform adequately, and all drivers have occasional nondeliberate lapses from adequate performance. The new and inexperienced driver, for example, regardless of his intentions and attitudes, will inevitably make errors. . . . Some of these errors will undoubtedly result in citations and crashes (as the disproportionate crash involvement of young drivers would seem to indicate), but to assume that these can be eliminated by deterrents is to assume also that the new driver is capable of a level of performance which in fact he has not yet achieved."<sup>3</sup>

Mr. MAISONPIERRE. I would like to bring this out. There is a way which I think has been overlooked by many people.

Senator HART, I am sure you have heard of the woes and the complaints of the presidents of the automobile manufacturers in the rather dramatic drop in the sale of the so-called muscle cars. We have been told by the manufacturers, in fact we have been severely criticized by the manufacturers in discussions we have had with them, that the insurance system, the loading of the insurance rates on these muscle cars has deterred the sale of the cars.

Now we do know this. We do know from statistical evidence, from studies which have been made by a number of companies that the muscle cars do cause more accidents and more serious accidents.

So, at least the present insurance system in its rating has kept off the roads, I gather from what the manufacturers say, a substantial number of such muscle cars. And this has brought about a reduction in the number of injuries. I think this is to some degree a deterrence.

The cost of the present automobile insurance for the high-powered cars which are the cars which cause a much higher proportion of accidents on the road have kept those cars off the roads.

Senator HART. While Mr. Sutcliffe is reacting to that, let me say something that, of course, is reasonable in Detroit, but logically what is suggested by the point you just made that muscle cars have been reduced in number because of the economics of the insurance rating system and we have thereby reduced the number of serious accidents? Does that suggest in terms of the national good we would be better off if all cars were of lower horsepower and smaller in body size?

<sup>1</sup> David Klein and Julian Waller, *Causation, Culpability and Deterrence in Highway Crashes* (1970), for the U.S. Department of Transportation (hereinafter cited as *Causation, Culpability and Deterrence*), and U.S. Department of Transportation, "The Human Factor in the Highway Environment: Normal and Deviant Behavior," *Driver Behavior*, pp. 111-198.

<sup>2</sup> *Causation, Culpability and Deterrence*, p. 130.

<sup>3</sup> *Ibid.*

Mr. MAISONPIERRE. Senator Hart, I can only give you my own personal feeling on this, not our association's feeling. I would certainly welcome a trend which I think perhaps we are witnessing in the small and less powerful cars. I would welcome it for a number of reasons.

No 1, cost of operation.

No. 2, safety.

No. 3, I have children driving those cars, and I would just as soon have them drive cars which are not as powerful, they don't have the getup and go which some of them do.

On the other hand, I think that we should recognize that as long as we have a system which is built on speed and on power, I cannot totally do away with the idea that cars need to have some so-called reserve power. I say this because in the fairly recent years, the only serious or close call I have ever had in a car was driving a car which had very little power, it was a foreign car with very, very little power, trying to pass a truck when perhaps I shouldn't have passed the truck, and almost getting involved in a pretty terrible accident. I had misjudged the reserve power of the car.

I think from personal experience, I think there is something to this reserve power, but still the trend toward making speed and power attractive should be reversed, and we should encourage in every possible way to reverse this trend.

Senator HART. Thank you.

Mr. SUTCLIFFE. Mr. Maisonpierre, in response to your example of possible behavior modification that occurred because of higher premium rates being assigned to muscle cars, I can only say in response to that analogy and in questioning its applicability that, as Senator Hart pointed out, with regard to the film which we saw on the record, that every mile of traffic driving requires about 20 major decisions on the part of the individual. Whereas in the decision to buy a car, though many, many factors are involved, there is usually one decision at a particular point in time with an ability to be very careful and selective and one where price would have a much more direct impact. In fact this very principle is recognized in S. 976 when we asked insurance companies to rate vehicles on the basis of property damage susceptibility and ask for the index for injury severity.

Whether or not a rate increase following an accident would modify driving behavior is questionable. There may be deterrent value, but it might affect only one or two of the kinds of conscious driving decisions. But in that 1 mile and those 20 major decisions price might not be able to reach all making other behavioral factors that make up a person's total driving behavior.

Also, rate increases oftentimes will occur across the board as to the classification and maybe one accident will not result in another classification, particularly if a person is in a high-risk category already.

So the relationship of his own personal driving behavior to a cost increase might be much less direct than his own premium cost because he has a muscle car. That would be a possible distinction between the muscle car deterrence analogy which you suggest and its applicability to driver behavior modification.

Would you care to respond?

Mr. MAISONPIERRE. I want to make it very clear that we endorse wholeheartedly Senator Hart's suggested recommendation which we

find in the bill, that automobiles be rated on the basis of their damageability and safety. In fact, Senator Hart, following the hearings which you held 2 years ago, one of our companies immediately got started along these lines. It has been severely criticized perhaps by some of the manufacturers. It has set up some very definite classification rates and has filed those classification rates in quite a number of States following up on your recommendation, and we do endorse that part of the bill.

We also recognize that driving a car requires a great many acts, both conscious and unconscious, but we believe that the human body is amazingly adaptable and that, in spite of the crowded condition of the highways, there appears somehow to be enough leeway in the operation of a car that even though one should recognize all of these difficult things that must be done to drive a car, still, the majority of people drive without accidents for many, many years.

Mr. SUTCLIFFE. I think we have exhausted that particular subject. Perhaps on some of these other issues we can submit questions for the record.

I have one further question, and it relates to a part of the plan called insolvency protection. You advocate the passage of post-insolvency assessment laws in the various States.

Mr. MAISONPIERRE. This is right.

Mr. SUTCLIFFE. I would like to ask whether or not the State of Illinois has yet passed an insolvency bill.

Mr. MAISONPIERRE. As of this morning the Illinois Legislature had passed a bill through the house, the senate insurance committee has reported out a bill unanimously. The bill was pending on the floor of the Senate. Seasoned observers feel convinced that there is no question whatsoever that the bill will be enacted by the Illinois Legislature in the very near future, if not today. But I checked on this this morning before coming down.

Mr. SUTCLIFFE. I imagine that if one were to test the coverage, the State-by-State approach to insolvency which your organization has fought very strongly for, one would also have to inquire about the progress of insolvency legislation in the State of Texas.

Mr. MAISONPIERRE. There again, Mr. Sutcliffe, the situation is identical to that in Illinois. The bill passed unanimously through the House, it passed unanimously through the appropriate Senate committee—I am not sure which committee it is—and it is pending on the floor, and there is no question whatsoever that the bill will be enacted by the legislature and signed by the Governor, in both Illinois and Texas.

We have worked very hard to enact such laws, not only in Illinois and Texas but in all jurisdictions. I would expect by the end of this legislative year, in the neighborhood of 42 or 43 States at least will have enacted the model NAIC postassembly insolvency law.

Mr. SUTCLIFFE. With the experience of insolvencies in several States which have had postinsolvency assessment laws, what is your association's appraisal of the way in which they have been able to handle consumer claims made to the industry insolvency fund in lieu of their own companies because of the insolvency?

Mr. MAISONPIERRE. I think this has worked out quite well. I know of two particular cases, one in California and one in Arizona, and if I may, Senator Hart, I would like to submit for the record the status of the pending claims at this time.

In Arizona—

Senator HART. For the committee's files, yes, we would welcome it.

Mr. MAISONPIERRE. I know in Arizona it was just a matter of a few months after the insolvency had occurred that the majority of the claims had been paid, and by that I mean, as you well know, some of the cases in the present system must go through the same procedure that any other case must go through; that is, the liability must be determined. But there has been absolutely no delay occurring in a payment of claims because of the insolvency.

I would like to introduce for the record the status of the insolvency losses in California and Arizona.

Mr. SUTCLIFFE. Mr. Maisonpierre, the assigned claims provision in S. 945 as to the treatment of insolvencies closely parallel the kind of collective action of insurance companies in the States under postinsolvency assessment plan. Could you furnish for the record your reaction to that kind of an approach to taking care of the insolvency problem and its compatibility with the existing postinsolvency assessment plans which the States have enacted?

Mr. MAISONPIERRE. I would like to submit this for the record, if I may.

(The following information was subsequently received for the record:)

#### COMPARISON OF ASSIGNED CLAIMS PROVISION OF S. 945 AND STATE POST INSOLVENCY ASSESSMENT PLANS

For the following reasons, we believe that the state post insolvency programs are by far preferable to the assigned claim plan of S. 945.

##### 1. *The Assigned Claim Plan is an incomplete solution*

The state programs cover all insolvencies related to all lines of property and casualty insurance. In fact, approximately 95% of all property and casualty premiums are today protected through state insolvency programs.

The Assigned Claim Plan limits its coverage to automobile, thus leaving a major coverage gap.

The state programs not only insure the payment of insolvency losses but are so structured as to improve the regulatory climate to prevent insolvencies in the first place. The Assigned Claim Plan, on the other hand, makes no pretense to seek to prevent companies from becoming insolvent.

##### 2. *The Assigned Claim Plan assignment could result in the unfair treatment of smaller companies*

The state insolvency programs distribute the insolvency losses proportionately to the amount of insurance which every company writes. The Assigned Claim Plan, on the other hand, would distribute the claims on such a proportionate basis. Thus, under the Assigned Claim Plan program, a small company could be assigned a major loss—way out of proportion to the amount of insurance be assigned a major loss—way out of proportion to the amount of insurance it writes. This is obviously highly undesirable.

##### 3. *The state insolvency plans allow for tight cost control*

The state plans concentrate all of the insolvency claims and losses through one administration. Thus, close cost accounting and accountability can be maintained.

The Assigned Claim Plan, on the other hand, would diffuse the claims and the losses and it would be most difficult under an assigned claim program to keep accurate accounting of the losses.

Mr. SUTCLIFFE. One other thing for the record, Mr. Maisonpierre. You have no doubt been familiar with the figures that we have been working with on this committee, \$14 billion of premiums collected annually—these are estimates for 1970—\$11 billion of economic loss an-

nually, an insurance mechanism providing \$7 billion of benefits and those benefits not distributed on a 1-to-1 ratio as dollars of economic loss.

For the record, could you provide and actuarially justify to the extent possible, how you would think that the total premium dollars and the benefits paid would shake out if your plan were adopted simultaneously in the 50 States? I think we should assume at this point also a car population with five-and-five bumper capability to give the property damage side of the picture as well as the bodily injury side of the picture if you can. To the extent you can factor this out, and where you have holes in your own estimates, if you indicate those to the committee, we would certainly appreciate it.

Mr. MAISONPIERRE. We would like to do this.

I would like to say one word. You are predicating, of course, the losses, the economic losses and the extent of loss recovery I would imagine to a large degree on the DOT's economic consequences of motor vehicle accidents study. We have some grave questions about the accuracy of the data collected in the study.

I know that you are pressed for time and I will not go into it. We do have a critique of this study as part of our appendix in our statement, and I would like to emphasize that we do not happen to agree with the data collected, and the reasons for our disagreement are detailed as one of the appendices of our statement.

Mr. SUTCLIFFE. Perhaps then you could provide your cost estimates on the basis of your own figures for the present system, DOT's figures for the present system updated to the \$14-\$7 billion relationship so that we can have both pictures.

Mr. MAISONPIERRE. Very good, sir.

Mr. SUTCLIFFE. And then we will be in a position to judge which picture we will use for examination or where the differences are and how significant they are.

Mr. MAISONPIERRE. Right.

(The following information was subsequently received for the record:)

ARIZONA INSURANCE GUARANTY ASSOCIATION,  
Phoenix, Ariz.

*Summary of loss claims activity—Period ending Feb. 26, 1971*

Automobile:

Closed .....	341
Open .....	242
Amount expended.....	\$43,307.64
Present reserves.....	\$585,607.00

All other:

Closed .....	95
Open .....	56

Present reserves.....	101,809.00
Total expended.....	67,347.00
Total outstanding reserves.....	\$687,416.00

## KEY INSURANCE EXCHANGE INSOLVENCY ADJUSTERS.

Los Angeles, Calif., April 26, 1971.

Re Key Insurance Exchange

liquidation progress report.

Mr. R. E. EARLY,

Chairman, Board of Governors, California Insurance Guarantee Association,  
Los Angeles, Calif.

DEAR BOB: Herewith is a listing of drafts we have issued from the inception of our program to April 1, 1971. Our first claims draft was issued on December 1, 1969.

Type of drafts issued	Number	Amount
Bodily injury.....	202	\$393,934.90
Medical payments.....	50	6,348.61
Uninsured motorists.....	83	137,435.42
Property damage.....	66	19,292.10
Collision.....	75	38,624.08
Comprehensive.....	31	10,180.26
Allocated legal expense.....	298	139,801.80
Allocated adjustment expense.....	223	10,742.14
Unallocated adjustment expense.....	125	55,403.66
Premium refunds to members.....	4	543.98
<b>Total.....</b>	<b>1,157</b>	<b>812,306.95</b>

Our Novato Bank Account was closed during this period, which required the cancellation of a substantial number of small "stale drafts" mostly of the Property Damage, Collision and Comprehensive category. An audit of all drafts issued to date also resulted in the change of some draft allocations. Therefore the number of drafts listed as issued on this April Report in some cases is less than shown on our January Report.

## CLAIM RESERVE SUMMARY—EXCLUDING ADJUSTMENT EXPENSE

The following is a list of claims reserves outstanding on April 1, 1971, compared to December 20, 1969, the date of our first audit.

	Dec. 20, 1969 claims count	Dec. 30, 1969 reserves	Apr. 1, 1971 claims count	Apr. 1, 1971 reserves
Bodily injury.....	354	\$782,183.00	120	\$341,000.00
Medical payments.....	74	26,230.00	0	0
Uninsured motorists.....	115	183,672.00	24	65,000.00
Property damage.....	467	181,941.00	13	14,835.00
Collision.....	141	57,655.00	0	0
Comprehensive.....	72	21,251.10	0	0
<b>Total.....</b>	<b>1,223</b>	<b>1,252,932.10</b>	<b>157</b>	<b>420,835.00</b>

## NOTES TO ABOVE CHART

A. During the past three months, we have reduced the number of open claims by 62 units.

B. In this period, we have paid out a total of \$49,884.41 on claims (not including legal or claims expense) and have reduced our outstanding claim reserve by \$54,915.00.

C. Compared to our initial *claim reserve* of \$1,252,932.00, we have paid out \$805,815.37, and have reduced this reserve by \$832,097.00.

*Adjustment expense*

During the past three months, we have incurred \$19,842.75 in legal expense, and \$6,503.29 in allocated and unallocated adjustment expense. Our remaining reserve of \$96,081.94 to cover future legal and adjustment expenses should be adequate.

*Financial statement*

The attached statement reflects our position as of April 1, 1971.

Based on our experience to date, I believe these estimates are realistic, except the asset of our estimated recovery as a general creditor of Key Insurance Exchange may be over-stated. Any shortage in this estimate of \$100,000.00 will be more than offset by our interest income, which has not been included in our claims accounting figures.

R. H. WENZEL

*California Insurance Guarantee Association financial statement—Apr. 1, 1971*

Assets:	Amount
CIGA premiums.....	\$1,350,104.64
Less expenditures to date.....	812,306.94
Total .....	537,797.64
Estimated future subrogation recoveries.....	1,000.00
Estimated recovery as general creditor of Key Insurance Exchange .....	100,000.00
Grand total.....	638,797.64
Liabilities:	
Claims reserves.....	420,835.00
Less future statutory savings.....	—20,000.00
Total .....	400,835.00
Allocated and unallocated adjustment expense reserve.....	96,081.94
Total .....	496,916.94
Surplus .....	141,880.70

Senator HART. If there are additional questions, may we submit them to you and we will hold the record open for a while.

Mr. MAISONPIERRE. Thank you, sir.

Senator HART. Again I have enjoyed the exchange and I know as I have said before, when we get into an analysis of the details that you have furnished us, it is going to be helpful.

Mr. MAISONPIERRE. Thank you.

(The statement follows:)

## I. INTRODUCTION

My name is Andre Maisonpierre, and I am a vice president of the American Mutual Insurance Alliance. We are a voluntary association of more than 100 mutual insurance companies which provide automobile and other property-casualty coverages in all 50 states and the District of Columbia.

We welcome this opportunity to tell you what the Alliance is doing to reform the automobile reparations system, to share our research with you, and to offer you our views on the proposals currently pending in Congress.

Automobile crashes impose an increasingly heavy burden on the American public. One out of four automobiles on the highways is involved in an accident each year. That adds up to more than 20 million crashes, 30 million damaged vehicles, more than 4 million injuries, 55,000 deaths and a staggering economic loss exceeding \$16 billion. That's the equivalent of about \$75 for every man, woman and child in the United States, or \$375 for a family of five.

The human cost - the pain, the injuries, the loss of life - are borne directly by the accident victims and their families. But the economic loss is shared by every motorist and consumer, in their out-of-pocket expenses and in the insurance premiums they pay.

## II. THE GUARANTEED PROTECTION PLAN FOR AUTO REFORM

The American Mutual Insurance Alliance believes these excessive human and economic losses can be dramatically reduced. We have developed a reform proposal called the Guaranteed Protection Plan, which deals with all of the major factors contributing to high insurance costs and consumer dissatisfaction. This is a comprehensive

approach to the automobile problem - an approach that calls for responsible reform in the auto reparations system, in vehicle design, in driver performance, and in traffic safety regulations.

The Guaranteed Protection Plan is the result of a decade of statistical studies, legislative research, public attitudes surveys, auto crash tests and field experiments with new claims handling methods.

This proposal is based on the premise that automobile insurance reforms alone cannot lift the intolerable burden created by highway crashes. Changes in insurance affect only what happens to the loss after it occurs - whether it is to be borne by the crash victim, paid by the negligent motorist, or shifted to someone else's shoulders. Any meaningful reform program - to be effective and serve the best interest of the consumer - must also concern itself with measures to keep the loss from occurring in the first place, and to reduce the severity of injuries and economic costs.

Reducing the number of crashes will be extremely difficult, because both the number of cars and the mileage driven are going up much faster than the growth in population. Thus each person's chances of having an auto accident are getting worse every year as congestion worsens and the average person's exposure to traffic lengthens. Herculean efforts to improve roads, vehicles and driver performance will be needed just to keep the number of accidents from getting much worse.

The prospect for reducing the excessive costs of auto crashes is much more hopeful. Changes in automobile design, using technology already developed and available, can bring about dramatic reductions

in the economic burden created by highway crashes.

A. Automobile Design - Key to Major Insurance Savings

Damage to vehicles accounts for a major part of the excessive economic loss produced by highway crashes. One reason is that damaged cars outnumber crash injuries by more than 7 to 1. The other reason is that today's cars are vulnerable to an astonishing amount of damage in low-speed, "fender-bender" crashes. Four popular sedans recently crash-tested into a barrier at walking speed - 5 miles per hour - produced repair bills averaging \$332.

The result is that auto damage has become the dominant factor pushing up the cost of automobile insurance. Few people realize the startling impact which high repair bills are having on the insurance premiums paid by individual car owners.

About two-thirds of the total premium paid for a typical full package of automobile insurance goes for coverages that pay for vehicle repair or replacement, including collision insurance, property damage liability and comprehensive physical damage (vandalism, theft, hail damage, etc.). The bodily injury portion of auto insurance typically accounts for only one-third of the total insurance premium (See Exhibit 1).

Moreover, the cost of the vehicle coverages is now rising at an accelerating rate, while the cost of the bodily injury coverages is slowing down. Rate filings made in a number of states over the past few months called for increases in the vehicle damage coverages of 10% to 20% or more, while the bodily injury rates remained the same or required minimal increases.

The accelerating cost of auto repair also can be demonstrated by auto damage appraisals made over an 11-year period, by the actual amounts paid out for vehicle damage claims, and by looking at the one-year increases revealed in the crash tests conducted for the Insurance Institute for Highway Safety, the wholly-owned research arm of the auto insurance industry.

The appraisal method compares the cost of repairing front-end collision damage involving comparable parts on 1960 cars damaged in 1960, and 1971 cars damaged in 1971. Repair estimates are for damage to the front bumper, grille, fender, headlight, radiator, windshield, fan and water pump.

	<u>1960 Repair Cost</u>	<u>1971 Repair Cost</u>	<u>% Increase</u>
Ford Fairlane 500	\$388.77	\$ 947.64	144%
Chevrolet Biscayne	\$435.95	\$ 845.79	94%
Pontiac Catalina	\$423.39	\$1,024.13	141%

These results are corroborated by rating bureau data on the amounts actually paid out in insurance claims for vehicle repairs. The average repair claim jumped from \$131 in 1960 to an estimated \$276 in January, 1971 - an increase of 111%.

Earlier testimony by Dr. William Haddon, Jr., president of the Insurance Institute for Highway Safety, also confirms the accelerating increase in auto repair costs. The Institute's recent crash tests on twelve 1971 car models show that the 1971 cars cost an average of 50% more to repair than their 1970 counterparts - in spite of all that has been done to stimulate auto manufacturers to recognize the impact which fragile designs has had in increasing the transportation costs of the American consumer.

Specifically, damage to the 1971 models in crashes at only 5 miles per hour averaged \$332, as compared with \$216 for the 1970 models.

These test results clearly indicate that presently available technology continues to be ignored in the design and manufacturing of automobiles. The technological remedies remain on the shelf where they have gathered dust for many years.

Dr. Haddon was particularly critical of ineffective auto bumpers that do little to protect the car from damage even in these low-speed collisions. In addition, he noted that retractible headlights, fancy chrome grilles, and other design features intended primarily for aesthetic appeal have added substantially to the damageability of today's automobiles.

The Institute's testimony covered a number of misunderstood points about low-speed crash problems. Dr. Haddon was emphatic in stating that there is no necessary conflict between the goals of protecting automobile occupants from injury and protecting the vehicle itself from costly damage in collisions. He noted that vehicle designs which would accomplish both objectives are well within the present state of the art.

Another misunderstanding is that car designs to prevent low-speed crash damage would automatically mean car price increases. Dr. Haddon testified that by doing away with unnecessary configurations and ornamentation, and using the freed-up space for proper energy absorbing structures, auto manufacturers could reduce the initial price of the vehicle or, at worse, maintain it at its present level.

The Institute's testimony also noted that collisions resulting in damage to the rear ends of cars are nearly as common as collisions involving damage to front ends of cars.

Most importantly, the results of the Insurance Institute's low-speed test crashes show that the bulk of property damage is produced by minor crashes.

To get a more accurate picture of the economic losses involved in low-speed collisions, one major insurance company has tabulated the property damage claims it closed during a one-month period late in 1969. A total of 10,583 claims were tabulated. These represented collisions occurring on a country-wide basis, involving liability claims made by the other drivers for damage to passenger cars. This study reveals that 92% of all these insurance claims were for \$600 or less. Thus, the Insurance Institute's estimates of damage done in low-speed crashes have been verified by actual experience.

The Department of Transportation's report makes mention of the significant opportunities for economic savings in minor accidents. The report notes that 46% of the total estimated compensable economic loss resulting from 1967 automobile accidents was for property damage and that approximately 22 million victims of accidents who suffered only property damage incurred total losses of about \$3.8 billion.

We concur wholeheartedly with these conclusions of the Department of Transportation:

"A car capable of resisting damage in low-speed collisions and of protecting its occupants in severe crashes would very substantially reduce overall accident losses, even if all vehicles in severe crashes were totally demolished in an economic sense. Economic loss reduction

efforts, therefore, to be truly effective, must address the accident environment of both the serious and minor crashes."

Improvements in vehicle design already are helping to reduce crash injuries and to minimize the cost of the economically less significantly bodily injury coverages. Over the past four years, the severity of injuries has been substantially reduced by regulations requiring auto manufacturers to install impact-absorbing steering columns, more crash-resistant glass in auto windshields, front and rear seat belts, stronger doors, and other safety features.

The result is that the cost of bodily injury liability insurance has been rising at a much slower rate than the cost of vehicle damage insurance, despite the zooming cost of medical care and the rising cost of replacing income loss as the result of auto crash injuries.

Similar dedication to reducing car fragility would go a long way toward actually reducing the cost of automobile insurance. The American Mutual Insurance Alliance will continue to support measures aimed at this objective as part of its Guaranteed Protection Plan. I will comment further on this in Section IV. Impact-absorbing bumpers and more crashworthy cars are absolutely essential if auto insurance costs are to be reduced or even stabilized. Some companies already are rating cars for damageability. Others have offered a 20% reduction in the cost of collision insurance for any car that can withstand even a 5-mile-per-hour crash, rear and front, without damage.

As for compensation to car owners for damage caused in highway crashes, the Guaranteed Protection Plan would retain existing property damage liability protection for situations where the negligent driver should pay. The Plan also would retain collision and compre-

hensive coverages for those situations where the vehicle owner himself is responsible for the damage to his own car.

**B. Proposed Reforms in the Auto Reparations System**

The Guaranteed Protection Plan also calls for major reforms in the auto reparations system. This portion of the Plan would produce changes in the insurance coverages purchased by car owners, changes in the procedures used to compensate crash victims, and changes in the legal rules governing settlements of disputed claims.

These proposals for responsible insurance reform are designed to achieve a reasonable balance among three difficult and often contradictory goals:

1. To provide crash victims with prompt and fair compensation.
2. To encourage driver responsibility.
3. To keep overall costs at a reasonable level.

This portion of the Plan also seeks to allocate the cost burden fairly among vehicle owners, to prohibit unwarranted cancellations of insurance and to ease the burden on congested courts.

Highlights of the proposal are as follows:

**1. Basic Benefits Would Be Guaranteed**

State laws would be amended to require that every private passenger automobile policy issued or delivered in the applicable state shall include the following minimum benefits payable regardless of fault:

- (A) Medical and hospital expense coverage up to a \$2,000 per person limit in any one accident and subject to an optional deductible (applicable only to the named insured and resident family members) up to \$250.

(B) Disability income coverage of 85% of gross income lost during a period commencing 30 days after the accident and continuing for 52 weeks, subject to a maximum of \$500 per month or a total of \$6,000.

Persons covered include the named insured, members of his family residing in the same household, guests, passengers and pedestrians. Insurance companies would be permitted to offer broader coverages than the statutory minimums, and it is anticipated that healthy competition would provide a wide choice of higher limit, first-party coverages for vehicle owners who desired to purchase them.

## 2. Driver Responsibility Would Be Retained

Existing liability protection would be retained and made to work more effectively under the Guaranteed Protection Plan. Persons injured through the negligence of another driver would be entitled to compensation from the other driver for damages that go beyond the basic benefits. In addition, insurance companies which paid the medical and disability benefits to their own policyholders could seek reimbursement from the party at fault (if any) or that party's insurance company. Thus, the proposed system would be no-fault in the sense that the accident victim would collect for his basic economic losses, regardless of who caused the accident. But it would be a fault system in the sense that it would preserve the principle of personal accountability. The cost of the accident ultimately would be charged against the record of the negligent driver, and not against the record of the innocent victim as would be the case under a total no-fault system.

## 3. Claim Settlements Would Be Streamlined

Two different types of arbitration would be used to speed settlements, cut the cost of handling claims and ease the burden on the courts.

The Plan calls for mandatory arbitration of disputes in the vast number of liability claims involving damages under \$3,000, using court supervised procedures which have worked successfully in Pennsylvania since 1952. One of the Department of Transportation's studies found that 73% of litigated cases fall into this under-\$3,000 category. In Pennsylvania, such cases are assigned to a three-man arbitration panel, operating under rules and procedures established by the court having jurisdiction over the case. Either party may appeal the arbitrator's decision. However, the rate of appeals has been less than 8% under the compulsory arbitration procedure used in Philadelphia. A similar system was instituted on a three-year trial basis in New York State on September 1, 1970. Initial reports indicate that the plan has been well accepted in the Monroe County test area, which includes the City of Rochester, and that other areas of New York are considering adoption of mandatory arbitration.

A second form of arbitration would be mandatory in resolving disputes arising in subrogation claims between insurance companies. Intercompany arbitration already is widely used for handling auto property damage cases. The procedure is quick, inexpensive and efficient. The important thing is that the claimant is paid first and then any necessary readjustment of the insurance loss is made between the companies, without burdening the courts.

4. Objective Yardsticks Would Be Established For Measuring Damages

The Guaranteed Protection Plan would provide an objective standard for determining general damages - such as the damages for disfigurement, loss of bodily function, pain and suffering, and other damages which

go beyond the accident victim's out-of-pocket economic losses such as medical expenses and lost wages.

Payments for these general damages would be limited to no more than 50% of medical and hospital expenses if such expenses ran \$500 or less. When medical and hospital expenses exceeded \$500, payment for general damages may not exceed \$250 plus up to 100% of the excess over \$500. These limits are intended to curb nuisance claims and to offset the cost of extending the basic no-fault benefits to accident victims generally. These limits do not apply in cases involving death, permanent disfigurement, dismemberment, permanent loss of a bodily function, and in other exceptional circumstances where a court or jury finds that such a limitation would be unjust. The court, or either party, may request an impartial medical panel to make a determination of this and other issues.

Objective yardsticks also would be established for measuring loss of earnings. At present, damages for loss of earnings are not subject to income tax. This allows some people to be overcompensated, because their recovery is computed on the basis of gross earnings instead of "take home pay." The Guaranteed Protection Plan provides that these loss of earnings awards be reduced in recognition of the income tax savings. The bill calls for a statutory 15% offset, subject to reduction if the claimant can show that his actual income tax would have been smaller. Enactment of this provision will assure that claimants seeking damage for loss of income will be neither undercompensated nor overcompensated for that loss.

##### 5. Legal Rules Governing Claim Settlements Would Be Streamlined

Two changes in the legal rules governing claim settlements are proposed.

One calls for adoption of comparative negligence laws. Twelve states have adopted one form or another of the comparative negligence rule. Moreover, the doctrine is applied in claims coming under the Federal Employer's Liability Act, the Merchant Marine Act and the admiralty laws of the United States and England.

The Alliance believes the Wisconsin type of comparative negligence statute to be the most equitable of the various types now in effect. It provides that the person injured can collect from a negligent defendant as long as he is himself less than 50% negligent, and the defendant is more than 50% negligent. However, the amount of his recovery is reduced accordingly.

The "contributory negligence" doctrine currently in effect in most states provides that an injured party is completely barred from recovery even though his negligence was slight in comparison with that of the other party to the accident. In practice, the existing rule is not actually so rigidly enforced, and juries as well as insurance adjusters often apply something akin to a comparative negligent rule in arriving at judgments or settlements. However, to the extent that the operation of the contributory negligence rule sometimes produces a harsh, unjust result in individual cases, the proposed reform will eliminate those inequities.

Another change in the legal rules governing claim settlements is intended to further encourage insurance companies to make immediate advance payments to injured victims to cover medical expenses and wage losses as they accrue.

It provides that such advance payments will not be considered an admission of liability in any subsequent legal action that may result. A similar rule is proposed for property damage claims, so they may be settled separately from any bodily injury liability claim arising out of the same accident. This would encourage prompt settlement of the property damage portion, where final settlement of the injury claim is delayed pending medical treatment or other causes beyond the insurance company's control.

6. Attorney Fees Would Be Regulated

The Guaranteed Protection Plan would place a limitation of 25% on attorneys' fees where such fees are contingent (dependent) on the amount awarded the person represented by the attorney. It also permits the courts to establish graduated contingent fees scheduled subject to the 25% limitation. Attorneys also would be required to report all contingent fee payments to the clerk of the court.

The contingent fee system is widely used in this country, and is regarded as a means of making available competent legal representation to persons who might not otherwise be able to hire an attorney. At the same time, there is widespread criticism that lawyers' fees in auto accident cases are too high. The proposed regulation would prevent abuses in those cases not removed from the courts by other provisions of the Guaranteed Protection Plan, such as the automatic first-party benefits and the use of mandatory arbitration in the vast majority of claims disputes.

Contingent fee regulation already is practiced today in some jurisdictions. The First and Second Departments of the New York

Appellate Court have established fee schedules. Regulation also is enforced in Maine, Oklahoma, Massachusetts (criminal and domestic relations cases), and Pennsylvania.

7. Fraudulent Claims Would Be Discouraged

The Guaranteed Protection Plan provides for imposing stiff penalties for false and fraudulent activities with respect to claims filed against individuals or insurance companies. It also includes provisions regarding the admissibility in evidence of unreasonable refusal by a claimant to submit to medical examination to determine the nature and extent of his injuries and the medical treatment thereof.

8. Arbitrary Policy Cancellations Would Be Prohibited

To protect car owners against unwarranted cancellation of their auto insurance, the Guaranteed Protection Plan calls for passage of legislation limiting permissible reasons for cancellation of private passenger automobile insurance policies to nonpayment of premium or suspension of drivers license or vehicle registration. Thirty-eight states already have enacted cancellation laws with insurance company support. Member companies of the American Mutual Insurance Alliance also have taken action through the appropriate rating bureaus to provide this protection voluntarily in the additional states. Passage of laws in the remaining states would make certain that all companies do so. The Plan further provides specific notice requirements with respect to the insurer's intention to cancel or nonrenew. It also requires that the reasons for cancellation be provided to the insured upon request.

### 9. Insolvency Protection Would Be Provided

To protect the public against insurance company insolvencies, the Guaranteed Protection Plan calls for prompt state enactment of post-insolvency assessment plans in every state where such plans are not already in effect. Under these plans insurance carriers licensed to do business in each state may be assessed to provide funds for paying the unmet claims of companies that become insolvent. To date, 33 states already have enacted insolvency legislation, including 1971 enactments by the states of Indiana, Maryland, Minnesota, Montana, North Dakota, Utah and Wyoming. Several additional states are expected to take action before the current legislative sessions end.

### III. GUARANTEED PROTECTION PLAN: COMPATIBILITY WITH DOT RECOMMENDATIONS

The reparations system reforms proposed under the Guaranteed Protection Plan are similar in most respects to the findings and recommendations of the Department of Transportation, as contained in House Concurrent Resolution 241. In his report to the Senate Commerce Committee on March 18, 1971, Secretary of Transportation John A. Volpe proposed that the states move promptly to experiment with reform plans which expand the use of first-party, no-fault coverages, but which avoid radical, irreversible changes. Mr. Volpe noted that "there remains much legitimate uncertainty about how far and how fast

the public wants or is willing to go" in changing the present system. He also said there exists "genuine and warranted" concern as to the "unknown and essentially unknowable price and cost implications of any major change in the system."

Because of these unknowns, and for other reasons relating to the undesirability of a federal takeover of the state regulatory function, the Administration concluded that state level experimentation is indicated.

The Guaranteed Protection Plan is consistent with that recommendation, and in fact, already is being actively considered in a number of states, along with other similar plans. The proposed concurrent resolution outlines six principles for the states to use in evolving a "rational, equitable and compatible" new system for compensating auto accident victims.

1. The first principle is that basic benefits should be provided to auto accident victims on a first-party, contractual basis. The Guaranteed Protection Plan would require that auto insurance policies contain such benefits.
2. The second principle is that basic benefits should be payable to all accident victims without regard to fault, excluding those who willfully injure themselves. The basic benefits provided under the Guaranteed Protection Plan are on a no-fault basis. However, we have suggested that legislatures also consider excluding no-fault payments to persons injured while driving a stolen car, those injured while seeking to elude lawful arrest, and those injured while driving under the influence of intoxicating liquor or narcotics.

3. The third principle is that the basic benefits should provide compensation for all economic loss, subject to reasonable deductibles and limits, and the system should be designed to avoid litigation for the mass of accidents. The Guaranteed Protection Plan's recommended basic benefit limits of at least \$2,000 for medical expenses and at least \$6,000 for wage losses would be adequate to cover in full the wage and medical losses incurred in more than 95% of all auto crashes, based on DOT data. Taken as a whole, the Plan also would eliminate the delay and expense of court trials for all but a few serious cases where settlements could not be arrived at by negotiation. And, even in these few cases, the accident victim would receive the basic no-fault benefits.

4. The fourth principle is that the reparations system should provide adequate, but not excessive, compensation to the accident victim at minimum cost. Therefore, the resolution provides that benefits obtainable by the accident victim from other benefit sources should be coordinated and meshed with those obtainable from the automobile accident reparations system with a view toward internalizing automobile accident loss costs by making automobile insurance the primary benefit source whenever feasible. The Guaranteed Protection Plan generally conforms to this principle. Basic benefits under the auto policy are primary, for the most part, and tort recoveries also are primary with the usual exception of workmen's compensation benefits.

5. The fifth principle is that maximum choice should be afforded the motorist in selecting his insurance source provided the

coverage complies with the principles for the required minimum mandatory coverage. With more than 800 insurance companies currently writing automobile insurance, most motorists today already have a very wide choice of insurance sources. In addition, the industry has established automobile insurance plans in every state to guarantee a source of insurance protection to the small percentage of motorists whose high risk characteristics make it difficult for them to obtain coverage in the voluntary market. The Alliance advocates that these plans be expanded to provide physical damage coverages as well as the bodily injury coverages, and that convenient premium financing arrangements be made available. Several states already have taken action to accomplish this result, and other states are expected to follow suit in the near future.

6. The sixth principle is that rehabilitation, avocational as well as vocational, should be a primary function and objective of the compensation system. The Guaranteed Protection Plan's basic benefits cover medical rehabilitation. Optional coverages and tort recoveries offer broader rehabilitation care.

The Alliance proposal also is consistent with Mr. Volpe's suggestion that states might want to experiment initially with a reform plan that would offset the cost of the first-party medical coverage by the savings achieved in revising the rules on general damages. Under the Guaranteed Protection Plan, such cost savings would be produced by imposing limits on the amount of general damages that could be collected for injuries not involving death, disfigurement or permanent impairment. In addition, the provisions requiring car manufacturers

to install more crash-resistant bumpers would bring about even more significant savings on the dominant vehicle damage portion of the overall insurance premium.

The Alliance also specifically endorses the finding that "assumption of the present comprehensive state regulatory authority over automobile insurance by the Federal Government would be fraught with great and grave consequences giving rise to issues and problems of great magnitude, and is highly undesirable."

Our differences with Mr. Volpe have to do primarily with matters of timing, and of defining what constitutes a "radical, irreversible change." Mr. Volpe argues persuasively in his testimony that there is an urgent need for experimentation at the state level to clear up major uncertainties about the cost, workability and public acceptability of any new system. He concedes that the DOT does not have definitive answers to these questions, and says that "The experience of the state should have much to tell us about the most desirable final configuration of the motor vehicle reparations system."

Having established that major uncertainties exist, and that experimentation is needed to evolve a final configuration, very little credibility can be given to the DOT's speculations about what an "illustrative" or "ultimate" system might look like. It is inconsistent to call for experimentation, on grounds that the public itself must be allowed to participate in evolving the kind of system that will best serve its needs, and then to suggest a plan which goes beyond the point of no return in the very first stage of implementation.

In his testimony, Mr. Volpe seems to be suggesting that medical and rehabilitation losses be placed on a total no-fault basis immediately, and that the concept of driver accountability be virtually eliminated for such losses by prohibiting subrogation and by restricting payment of general damages to a very small number of serious cases - less than 5% of all auto crash injuries. Income losses and other injury-related economic loss payments would be shifted to a first-party, no-fault basis at a later date. Mr. Volpe indicated that the feasibility of shifting some or all of the losses now being compensated under the third-party property damage liability coverage is more doubtful, in part because there is little opportunity for cost savings in making such a switch, and in part because the DOT is doubtful that a total no-fault system for vehicle damage would be acceptable to the public.

As proposed in the Guaranteed Protection Plan, the Alliance believes it is desirable to take action immediately to guarantee prompt payment of basic benefits for both medical and wage losses - not medical losses only. But all the available evidence indicates that the public will insist on retaining reasonable payments for general damages to innocent crash victims, and will insist that the principle of driver accountability also be preserved. Our Plan provides an efficient means of determining driver accountability through subrogation and arbitration procedures.

We believe the Guaranteed Protection Plan offers crash victims better benefits, and would allow for a more orderly testing of public sentiment. The people affected by changes in the reparations system

need to be able to see and make judgments about what they would gain and lose as the balance is shifted toward greater use of no-fault coverages. Our Plan also will provide a more feasible means of testing to what extent the public is willing to forego compensation for personal injury damage not measured by out-of-pocket economic losses.

The Alliance has strong doubts about the public acceptability of shifting all vehicle damage to a no-fault basis, now or later. The motorist whose car is smashed by a negligent driver today is entitled to full payment for the repairs under the other driver's property damage liability coverage. But under a total no-fault system, the owner of the smashed car would not be able to collect anything from the negligent driver, and would have to pay the loss out of his own pocket or, at a minimum, pay the amount of the deductible under his own collision coverage.

One major reason for taking an evolutionary, experimental approach is the uncertainty that exists with regard to what Mr. Volpe calls the "unknown and essentially unknowable" price and cost implications of any major change in the system. The hazards of enacting major new benefit programs without such experimentation are well illustrated by the experience with Medicare. When Medicare was introduced in July, 1966, the cost of Part B was \$3.00 per month, with equal contributions by the U.S. Government. In April, 1968, the cost was increased to \$4.00 per month, and on July 1, 1970 the cost went up to \$5.30 per month. A further increase on July 1, 1971 brings the monthly premium to \$5.60 per month - an 86.7% increase in five years.

Medicare Part A also has been forced to pass higher costs on to senior citizens by increasing the deductible. It was \$40 originally, then was increased to \$44 in January 1969; to \$52 in January 1970; to \$60 in January 1971. That's a 50% increase in the deductible in five years. The Medicaid program suffered even more severe cost overruns, forcing Congress to cut back the scope of the program and take away benefits from certain groups who had previously been eligible for benefits.

We find it difficult to understand the total absence of any recommendation by the Department of Transportation for some form of federal action aimed at reducing the damageability of automobiles. As we have already noted, the DOT report itself clearly spells out the fact that substantial cost savings could be accomplished if the manufacturers were made to comply with certain minimum standards aimed at protecting the automobile itself. We believe that the Department's failure to recognize the need for a systems approach in the automobile insurance area is a major flaw in its proposed solution.

#### IV. GUARANTEED PROTECTION PLAN: COMPATIBILITY WITH MOTOR VEHICLE INFORMATION ACT

The American Mutual Insurance Alliance has supported state legislation which requires the automobile manufacturers to provide better automobile bumpers. Several legislatures are considering laws similar to the one enacted in Florida, requiring that cars sold after January 1, 1973 be equipped with bumpers capable of sustaining a 5-mile-per-hour impact damage and 10-miles-per-hour by 1975. The state of Maryland has already enacted somewhat similar legislation.

We believe, however, that minimum federal standards in this area would be desirable. Accordingly, we endorse federal legislation which would give the Department of Transportation authority to issue standards aimed at making cars more crashworthy.

We question, however, the desirability of Section 5(c) of S.976. This Section would require the Secretary to issue as soon as practicable after July 1, 1972 a standard requiring that all cars manufactured and sold after January 1, 1975, have energy-absorbing bumpers capable of withstanding front and rear impacts of 5 miles per hour into solid barriers, with minimum prescribed damage.

We find it very difficult to understand delaying action until 1975. In his floor statement on the bill, Senator Hart promised these standards by July 1, 1974. Postponing the effective date of the standards six months will mean that 5 million additional cars will find their way on the road with inadequate bumpers.

But even July 1, 1974 is a disappointing timetable. We know that the technology is at hand. Furthermore, the state of Florida in enacting legislation imposing standards by 1973 gave ample time to the manufacturers to meet production timetables.

Because the Federal authority is a pre-empting authority, this Section provides the manufacturers with a  $2\frac{1}{2}$ -year umbrella during which time they need to do nothing about providing adequate bumpers. This, in spite of the fact that GM has publicly announced its ability to meet a 5-mile-per-hour front and  $2\frac{1}{2}$ -mile-per-hour rear impact system by August 1973.

Each year's delay penalizes the insurance cost for a whole generation. The average life of a car is about 10 years. So at

best, it will not be until 1985 that all cars on the roads will be equipped with adequate bumpers if this Section is allowed to stand as it is.

Perhaps it might be best for Congress to spell out specifically what it wants these standards to accomplish and allow the technicians within the Department of Transportation to set the standards. What is most needed initially is a total vehicle design capable of withstanding rear and front impacts at 5 miles per hour into a solid barrier.

The need for Congress to spell out its will is important in view of the inadequacy of some of the standards that have been issued by the Department of Transportation as related to manufacturing and design. We find, for instance, that the recently issued bumper regulations are considerably weaker than they should have been even within the present authority of the Department of Transportation. These unnecessarily weak regulations circumvent the implied will of Congress to put into application as soon as possible the technology presently available to make cars safer than they have been to date.

We particularly support the requirement that auto manufacturers test their new models for crash resistance and publish the data so that potential purchasers can use this information in their buying decisions. Auto insurers thus would be encouraged to rate the various makes and models on the basis of their damageability and ease of repair as is now done in Sweden.

Last year, we testified before the Senate Antitrust and Monopoly Subcommittee against the reinspection of damaged vehicles before they are allowed to return to the road. We did not believe that there

was sufficient evidence that such reinspection was practical and doubted that the inspection system was sufficiently sophisticated to warrant the extra costs involved.

Today, we urge the enactment of Title V of S.976 which calls for both periodic inspections and reinspection of damaged vehicles. We believe that the new inspection techniques which are called for in the Act make an inspection and reinspection program feasible. Furthermore, we are convinced that the findings of the California Highway Patrol's investigation of fatal single-car crashes make such inspections and reinspections imperative.

This California study examined 409 fatal single traffic accidents for mechanical failure. Some of its more dramatic findings show that:

- 29% of all vehicles examined had one or more mechanical defects.
- About 6.4% of the vehicles examined had a mechanical defect which caused the accident.
- Considering only vehicles that had a defect, approximately 63% of the defects observed either caused or contributed to the accident in which the vehicle was involved.
- There were 172 defective mechanical systems located in 119 vehicles.
- The most commonly observed mechanical defect was in the braking system. These accounted for 35% of all defects found. Next were steering system defects which accounted for 26% of all defects.
- Older vehicles are more likely to be mechanically defective than the newer models.

- Almost all of the mechanical defects were attributed to wear and lack of maintenance rather than design or assembly flaws.
- Drivers of vehicles with mechanical defects are more likely to be under 20 and less likely to be over 60 than drivers of nondefective vehicles.

This study indicates that a reinspection program as called for in this bill would substantially reduce the safety hazard of mechanical defects in all vehicles.

We support the concept of separating the function of inspection from that of repair. We believe that technology is available which would allow diagnostic centers to detect mechanical flaws within a minimum of time and cost if the manufacturers built into their cars simple devices allowing for electronic monitoring of possible hidden defects.

Independent diagnostic centers are essential to practical reinspection programs.

We do want to sound a word of caution in regard to reinspections, however. We are certain that reinspections of damaged automobiles following crashes will turn up a whole lot of things wrong with the cars not necessarily caused by the accident. We suspect that many car owners will erroneously conclude that all repairs are due to the crash, and that the total cost of repair should be covered by the insurance contract. Insurers will not be entirely successful in sorting out the "maintenance" repairs from the crash damage. This will bring about additional insurance cost which, however, we believe would be justified by the ensuing increase in safety.

We also support the Uniform Title and Registration program covered under Title V of the bill. The National Automobile Theft Bureau reports that 1 out of every 97 cars on the nation's highways was stolen last year. This means that some 930,000 cars were stolen in the United States in 1970. Despite some progress in the fight against car theft, Gordon H. Snow, Chairman of the Bureau, reports that "the major part of combating theft rings right now is to find effective ways of preventing these criminals from registering these cars that they steal."

The Alliance has over the years urged the states to adopt the auto title and registration program of the National Committee on Uniform Traffic Laws and Ordinances. We believe that widespread state adoption of these laws has assisted in the recovery of stolen automobiles, thus reducing the cost of insurance to consumers.

Uniform title and registration in all states would greatly reduce the number of fraudulent registrations now being used by car-theft rings. In states which have adopted the Uniform Title and Registration program - 42 - stolen automobile losses are down, and 81% of the cars stolen have been recovered. By contrast, the recovery rates in the nontitle states is only about 50%. Obviously, a substantial reduction in thefts or a substantial increase in recoveries would be reflected by an appreciable reduction in premium rates for theft insurance.

We want to again stress the Alliance's basic endorsement of the purpose of S.976. Although our specific objections are substantive, we believe that with suitable amendments this bill can be of major assistance in bringing under control the excessively high price now paid by consumers for auto crashes and for the insurance coverages that pay for crash damage.

V. GUARANTEED PROTECTION PLAN: COMPATIBILITY WITH CONSUMER ATTITUDES

One of the major considerations involved in assessing the practical and political feasibility of any new automobile reparations system is public acceptability. How do American consumers feel about some of the ideas that have been suggested for changing the auto insurance system? Does the public consider fault to be an outmoded concept? How would accident victims feel about giving up compensation for general damages? What do consumers consider to be the real causes of rising auto insurance rates? What steps would they like to see taken to reduce cost? How do they feel about the considerations used in raising or lowering auto insurance prices for particular groups and individuals?

Any new auto reparations system must be based on satisfactory answers to these and other questions if it is to earn public understanding and acceptance. Yet the whole subject of public acceptability has been largely ignored in much of the public discussion of ways to reduce auto insurance costs and to reform the reparations system. As an advisory committee noted in a report for the Department of

Transportation: "The largest single gap in knowledge about the motor vehicle accident compensation system concerns the people in it and the impact of the system upon them. Their perceptions, beliefs, attitudes, and behaviors are the subject of much speculation, supported by very little factual data."

This uncertainty about public acceptability is one of the major reasons why an experimental approach is urgently necessary. It is easy enough to criticize the shortcomings of the present system. But there is no assurance that a radical switch to an untried new system would bring instant consumer satisfaction, either.

In designing the Guaranteed Protection Plan, the Alliance has conducted major research into the questions of public attitudes, and has tailored the various proposals accordingly.

All of the available evidence indicates that the American public attaches considerable importance to the concept of driver responsibility for injury done to another. There is a growing demand in our society for more - not less - personal accountability and responsibility. This was demonstrated in a major national study of the attitudes and feelings of people who buy auto insurance, conducted by Market Facts, Inc., largest consumer survey firm in the nation. Market Facts specializes in marketing research and in the measurement of consumer attitudes. Included among its clients are the Columbia Broadcasting System, Life Magazine, U.S. Steel, the Ford Motor Company, the U.S. Department of Agriculture, the Social Security Administration and the U.S. Department of Transportation.

1. Consumer Attitudes Toward Driver Responsibility for Accidents

To find out how people feel about the causation of auto crashes,

the interviewers in this survey asked a carefully drawn national probability sample of 1,494 car owners the following question:

"Let's talk for a minute about auto accidents and why they occur. Please think about your own experience and other accidents you know of - and consider whether these accidents could be avoided and how they could be avoided." Then respondents were given a card showing four alternative answers and were asked which statement came closest to how they feel. The overwhelming majority, more than 9 out of 10, believe that most auto crashes are someone's fault. More than half feel that almost all accidents are someone's fault, if the facts are carefully studied.

#### Driver Responsibility for Accidents

	Percentage of Respondents
Almost all accidents are quirks of fate and no one is to blame.	2.0%
Most accidents are unavoidable. They are unfortunate, but inevitable.	6.0%
Most accidents are the fault of drivers. Someone is to blame.	40.3%
Almost all accidents are someone's fault if the facts are carefully studied.	50.8%
No opinion,	.9%

It's interesting that Professors Keeton and O'Connell also feel that the fault concept cannot be eliminated from the auto accident reparations system. In their book, titled "After Cars Crash," they have these comments on the need to retain the concept of making the wrongdoer pay:

"The public believes in that principle strongly enough that they would seriously object to any system that tried to do away with it

completely. Many proposals that would have abolished altogether the role of fault in traffic cases just never got anywhere."

The Guaranteed Protection Plan is a reasonable balance between the objective of encouraging driver responsibility, and the objective of compensating accident victims promptly and fairly. All auto accident victims, except those which may be excluded as a matter of public policy, would receive prompt payment of their basic economic losses, and those who are injured by a negligent motorist would also retain the right to collect additional compensation from the wrongdoer. In addition, the consequence of the accident would be recorded against the insurance record of the negligent driver through subrogation procedures. This makes possible a rating system which brings to bear the financial consequences of a negligent act on the person who caused the loss.

2. Consumer Attitudes Toward Eliminating "Pain and Suffering" Payments To Reduce Auto Insurance Costs

Public attitude surveys and field experiments confirm that auto accident victims who have been injured by a negligent driver are unwilling to give up the legal right to collect for general damages, often inadequately referred to as "pain and suffering."

One of the major objectives in conducting the Market Facts survey was to find out whether consumers really understood what they were being asked to judge when they were asked questions about giving up payment for something called "pain and suffering." Several previous polls, including the one conducted by the University of Michigan for the Department of Transportation study, have used this term without any definition of what it means.

Respondents were first asked, "Sometimes we read about payments from auto insurance companies to individuals for 'pain and suffering. What does the term 'pain and suffering' mean to you? What do you think these payments would cover? Anything else?"

The answers were quite revealing. The public had a wide variety of definitions, many of them erroneous. Many others were vague and uncertain. These results cast serious doubt on the validity of any survey that uses the term "pain and suffering" without explaining what it means in the context of auto insurance claims.

After respondents had been given an opportunity to volunteer their personal definitions of the term, it was explained that "pain and suffering," in the insurance sense, refers to payments made for disability, disfigurement, permanent impairment of bodily functions, inconvenience, discomfort, and other damages that go beyond such tangible economic losses as doctor bills, hospital bills, and lost wages. .

This survey is believed to be the first study in which people were given a detailed explanation of what they would be giving up if no compensation were provided for "pain and suffering." Having been given this explanation, respondents were then asked to consider the following question:

"Suppose that the cost of auto insurance could be reduced somewhat by eliminating 'pain and suffering' coverage from all policies. Payments would be limited to covering 'economic' losses such as doctor bills, hospital expenses, and lost wages or salary. How would you feel about the idea of cutting insurance somewhat by eliminating 'pain and suffering' payments?"

-33-

About 65% opposed this idea and 27% favored it. Among respondents who had previously filed an insurance claim, more than 70% were opposed and 23% favored it.

Consumer Attitudes Toward  
Eliminating "Pain and Suffering"  
Payments to Reduce Auto Insurance Costs

	Total	Have Filed Claims	Never Filed Claims
Opposed	64.7%	70.2%	62.3%
In Favor	27.3%	23.1%	29.1%
Don't Know			
No Answer	7.9%	6.7%	8.6%
Number of Respondents	(1494)	(463)	(1024)

This opinion survey was corroborated by an actual field experiment conducted by the Alliance over a full twelve-month period in the Syracuse and Rochester areas of upstate New York, and in several counties on the western edge of Chicago.

The 16 participating companies, representing a broad cross-section of the auto insurance business, gave third-party bodily injury liability claimants a choice of how they wanted their claims to be handled. They could collect all of their medical expenses up to \$5,000, plus wage benefits equal to about 105% of their losses, to be paid promptly as the losses accrued. Or they could reject this alternative and pursue a regular liability claim.

Some 2,890 auto accident victims took a part in the experiment - 587 in Illinois and 2,303 in New York. The major finding is that, given a choice between the guaranteed benefits offer and the payment available under the existing auto liability system, 25% of the eligible claimants elected to accept the alternative benefits in the Illinois experiment and 15% elected the alternative benefits in the New York

experiment. (Exhibit 1)

We certainly do not consider these results the final, authoritative answer on public acceptance of any new system. We do think it indicates that people who have been injured by a negligent driver expect to be paid something above their medical and income losses. The more serious the injury, the less interested they were in settling on an economic loss basis.

Another insight on this issue comes from the experience of Preferred Risk Mutual, an Iowa company, which has added no-fault wage and medical benefits to its auto insurance policies. We are told by an official of the company that many of their policyholders decline to accept the first-party benefits and file a claim against the other driver, feeling that the driver at fault ought to pay for the damage.

### 3. Consumer Attitudes Toward A Total "No-Fault" Plan

The Guaranteed Protection Plan recognizes the fact that auto insurance policies sold today make extensive use of both "fault" and "no-fault" coverages. Both concepts would be retained. Payment of benefits to auto accident victims would be made considerably less dependent on fault determinations, but the idea of determining responsibility for the accident would be retained for purposes of insurance rate determinations and for payment of damages that go beyond basic economic losses.

The Plan is based on the premise that the public does not have as yet any well formulated opinion about the merits of a total no-fault automobile insurance system. Mr. Jay Schmiedeskamp, who helped conduct the University of Michigan study on public attitudes for the Department of Transportation, was perhaps more candid than he intended

-35-

to be when he told a CPCU Clinic in Des Moines that "Existing attitudes toward the no-fault plan can be summarized very quickly - namely that there aren't any because it doesn't exist." He went on to say that attitudes toward a no-fault plan might change if one were actually put into effect. (Please see Exhibit 2 for a critique of the DOT's Public Attitudes study.)

However, some insight into the current state of public opinion on this issue can be obtained from the Market Facts national survey. After testing the respondents to find out their understanding of the term "pain and suffering," interviewers asked the following questions:

"Now I'd like your opinion on a new idea that's being talked about these days. The idea is to change the auto insurance system so that a person in an accident would go to his own insurance company for payment as is done with fire and health insurance.

"The question of who was 'at fault' in the accident would not be considered in the payment of claims. Those responsible for an accident would have the same coverage and protection as those who were without fault.

"Under this new system, those in accidents would be reimbursed for expenses they incurred because of the accident, such as medical bills, repair bills and lost wages. However, under this new plan no payments would be made to anyone for 'pain and suffering' losses such as those we just talked about. Do you tend to favor or tend to oppose this new system?"

With this understanding of a "no-fault" plan, about 6 out of 10 consumers were opposed. Among those who have had experience with the

existing claims payment system, almost two out of three were opposed.

Consumer Attitudes Toward  
Total "No-Fault" Plan

Percentage of Respondents

	Total	Have Filed Claims	Never Filed Claims
Opposed	57.9%	65.5%	57.4%
In Favor	31.3%	26.5%	33.6%
Don't Know	9.0%	8.5%	9.2%
(Number of Respondents)	(1494)	(463)	(1024)

A followup question was then asked of those who were opposed, as follows:

"If the new plan cost less, would you favor it or still oppose it?"

More than 7 out of 10 of those who opposed the plan said they would still oppose it, even if it were to cost less. Thus, it is clear that most auto insurance buyers reject the no-fault principle as described to them in this survey - and even the prospect of lowering insurance costs would not change the minds of the majority of those in opposition.

4. Consumer Attitudes Toward Making Auto Insurance A "Last Resort" Coverage

Since some of the "no-fault" proposals that have been made called for offset of other available benefits, consumers surveyed in the Market Facts project were asked to evaluate that idea with this question:

"A different plan is to have auto insurance pay only for injuries after the injured person has used up any benefits he may have received

from his other insurance such as Blue Cross, union benefits, sick leave or salary continuation plans. Generally speaking, do you think such an idea would be a good idea or not too good an idea?"

About two-thirds of the consumers interviewed felt that such a plan would not be "too good an idea." Again, the opposition was noticeably stronger among those who have had direct experience with auto insurance claims. More than 70% of them turned thumbs down. It's interesting that about 6% were perceptive enough to point out that they might exhaust their sick leave or health insurance and then be left without coverage if they had a subsequent illness or injury not caused by an auto accident.

#### 5. Consumer Attitudes Toward Merit Rating

Although the Guaranteed Protection Plan does not deal directly with rating matters, the type of auto reparations system ultimately adopted will have major implications for rating. For example, it would be difficult if not impossible to devise an acceptable "merit rating" plan under a system based on a categorical rejection of the fault concept. Actuarially, a drivers' past accident record is a good indicator of his probable future accident frequency. And there is strong public support for the idea of charging higher rates for accident-prone drivers and lower rates for those who are safe drivers.

However, it is also clear that most people are adamantly opposed to being surcharged because of their involvement in an accident which was not their fault. Yet how is fault to be determined under a system which rejects the whole idea of fault. If proponents of total no-fault plans remain true to their convictions and ignore fault entirely, will the majority of safe drivers be content to pay surcharges when

they are involved in accidents caused by negligent drivers? And if the fault concept is smuggled back into the pricing of insurance, why is it not also a valid concept to use in the settlement of claims?

It's interesting to note that when the Market Facts interviewers asked car owners for any suggestions they may have as to the responsibilities of the insurance industry for reducing auto insurance costs, the most frequent suggestion volunteered was that insurance companies follow the "merit rating" concept, with high rates for poor drivers and lower rates for good drivers. About 1 out of 4 respondents volunteered this suggestion.

#### 6. Consumer Attitudes On the Causes of Rising Insurance Costs

It is clear from public opinion polls, newspaper articles and other evidence that the public is concerned over rising auto insurance costs. However, this concern is by no means concentrated on the bodily injury portion of the auto insurance premium. In fact, it appears that car owners have a surprisingly clear understanding of the factors that are driving up auto insurance costs - and some strong ideas on what should be done to solve what they perceive as the real problems.

To put the cost issue into perspective, Market Facts interviewers asked respondents to consider a "deck of shuffled cards," listing things which might or might not contribute to high auto insurance rates. They were asked to sort the cards into piles according to how they felt each thing contributed to high insurance rates, if at all. The four piles were labeled (1) a great deal, (2) somewhat, (3) a little, and (4) not at all.

By far the most important contributing factor, in the opinion of consumers, is "too many reckless drivers." Nearly 78% said this

contributes a great deal to higher insurance rates. Next in order of magnitude are three characteristics having directly to do with automobile design: high power, fragile bodies, and expensive-to-fix bodies.

Several additional questions were asked about auto design and about so-called "muscle cars," defined as cars that will accelerate to 60 miles per hour in less than 8 seconds. About 8 out of 10 respondents said cars should be designed to reduce repair costs, even if this makes cars less stylish in appearance. This strong feeling is especially significant in the light of other recent evidence that the high cost of auto repair has become the major factor pushing up the cost of auto insurance.

Factors Which Contribute "A Great Deal" to Higher Auto Insurance Costs

	Percentage of Respondents
Too many reckless drivers - irresponsible, lawless, or drunken drivers	77.9%
Cars with too much power and speed - new high acceleration "racing" models	61.9%
Car bodies which are easily damaged - fragile, not sturdy	57.4%
Car designs which are expensive to fix because of "sculptured" bodies, unitized construction, etc.	53.4%
High prices from repair garages	48.0%
Too many unskilled drivers - poorly trained or inexperienced	50.2%
Cars designed with ornamental bumpers that don't prevent damage	51.1%
Small dents and minor damages cost too much to repair	46.9%
Too much congestion on roads - too many cars	46.4%

(continued)

**Factors Which Contribute "A Great Deal" to Higher Auto Insurance Costs (continued)**

	Percentage of Respondents
Traffic laws not enforced enough - too few arrests; sentences are too light	31.6%
Roads not designed for safety; not properly marked, lighted, repaired, etc.	29.9%
Procedures of automobile insurance companies are inefficient	17.1%

In summary, the Guaranteed Protection Plan has been designed so as to recognize what is now known about public attitudes toward the major issues involved in reforming the auto reparations system. More important, the Plan has been designed so as to permit an orderly public test of consumer reactions under actual operational conditions. It is not an irreversible change, as would be the case in a switch to a total no-fault system. Policymakers would retain many different options for modifying, speeding up, slowing down or altering the direction of change on the basis of actual experience under the new system. This would permit the public itself to help evolve the kind of auto reparations system which it feels will best serve its own needs and purposes.

#### VI. UNIFORM MOTOR VEHICLE INSURANCE ACT

The merits of the Guaranteed Protection Plan are perhaps best illustrated by comparison of its features with those of the so-called Uniform Motor Vehicle Insurance Act, now under consideration by this committee.

The Guaranteed Protection Plan represents a responsible, evolutionary approach to auto reparations reform - one that allows the affected public and policymakers alike to test out the workability

of the Plan. By contrast, the Uniform Motor Vehicle Insurance Act is a risky leap into the dark, representing a drastic, irreversible change in the system. In the course of our critique we will point to a number of shortcomings in both the philosophy and practicality of the Plan. We believe it would create inequities so severe as to make it unacceptable to the public.

### 1. Unresolved Problems

One of the most serious shortcomings of the proposal is its incompleteness. The bill draft leaves many questions unanswered and many serious problems unresolved.

The public is not being well served by being left in the dark about these unresolved issues. There is wide appeal in a plan which seemingly promises something for everybody with no controversy. But it is the obligation of this committee not only to examine these promises - which have been prominently publicized in the press - but also to examine the unresolved problems created by this proposal.

Specifically we think people have a right to know what their rates would be for the compulsory coverages, what additional coverages would be needed and what they would cost, what costs they would have to pay out of their own pockets, which claims would be paid and not paid under the proposed new form of insurance. People also have a right to know about the uncertainties, delays, frustrations, inequities, controversies and litigation which this Plan would generate.

For example, our claims people foresee major difficulties and legal controversy in determining how much to pay large numbers of auto accident victims under this Plan. The bill provides for income replacement in an amount equal to 85% of the accident victim's monthly

earnings at the time of injury, or \$1,000, whichever is less, for as long a period (up to 30 months) as the injury causes the inability to engage in gainful activity substantially the same or similar to that engaged in prior to the injury. The bill further provides that if the injured person worked substantially the whole year immediately preceding the injury, the income loss will be based on those previous earnings. If the injured person had just taken a new job, the loss would be computed on the basis of what a person doing similar work would have received during the immediately preceding year.

Several aspects of this issue are troublesome. One is that 55% of the persons injured in auto crashes are not wage earners at the time of the accident. These include minor children, housewives, students and retired persons. Many of these persons expect to enter or re-enter the work force at some future date, or to earn supplementary income in some way. But under the Uniform Motor Vehicle Insurance Act there is no way they can collect for any harmful effects an auto injury may have on their future earning capabilities unless they are totally disabled or can demonstrate that they have suffered permanent partial disability exceeding 70%.

The inequity is even more immediate and glaring in the case of the unemployed. Let's take the case of the thousands of aerospace workers now temporarily out of work, or the workers who were furloughed during the 1970 business slowdown and have not been rehired, or the construction workers who are seasonally unemployed. Under this federal bill, such persons would not be eligible for any wage benefits on a no-fault basis. Nor would they have a right to seek a tort recovery

for future wage losses unless they suffered permanent disability exceeding 70%.

This raises additional unresolved problems. How is "disability" to be defined? Does it mean industrial disability - i.e., impairment of the injured person's ability to perform gainful employment? Or is it limited to actual wage impairment? Or does it mean medical disability - i.e., physical impairment without reference to what this may mean in terms of the person's earning capacity? Does it include mental and emotional disability, or not?

Assuming a definition is devised, how is the extent and duration of disability to be measured? In the absence of any provision in this bill, these issues presumably would have to be resolved in the courts. It is interesting to note that in Texas, where workmen's compensation claims are court-administered, the judiciary is burdened with several times more workmen's compensation disputes than auto liability claims.

Serious problems of malingering would be likely to arise under a system which withholds compensation for serious bodily harm unless the injured person can prove that the damage is permanent and has resulted in more than 70% disability. Such problems are a major cause of concern under the workmen's compensation system, despite the many limits and safeguards built into that system but omitted from the proposed Uniform Motor Vehicle Insurance Act.

Such safeguards include administrative procedures and tribunals for determining the degree and duration of disability, and the active involvement of an employer in investigating the accident and in following through with the medical treatment, rehabilitation and

return to work of the injured employee.

Similar uncertainties and unresolved problems exist with regard to the definition of "disfigurement," and how it is to be measured.

## 2. The Seriously Injured Victim

Much of the publicity for the Uniform Motor Vehicle Insurance Act focuses on the plight of the seriously injured crash victim. Proponents have severely criticized the present system for its alleged failures to provide adequate compensation for such persons, and have promised that their plan would provide "almost total compensation."

Both the criticisms and the promises are somewhat inaccurate and overstated.

For example, in a news release issued February 24, 1971, Senator Hart said flatly that the "present system...provides auto victims with only 16% of their out-of-pocket losses." Subsequent inquiry reveals that this statistic is based on mismatching data from two different studies, and deals solely with the lifetime economic losses estimated for a tiny group of persons suffering permanent and total disability. It is not, as the news release erroneously implies, an indication of how the present system performs for all auto accident victims, or even for all of those defined as "seriously injured."

The DOT's study of seriously injured crash victims likewise contains a misleading picture of how the auto reparations system performs. The document titled "Economic Consequences of Auto Accident Injuries" is erroneously thought to show that some 500,000 persons categorized as "seriously injured" in 1967 auto crashes recovered only half of their economic losses.

But a radically different picture emerges when the data are examined in detail. In the first place, the survey did not involve 500,000 persons. It involved a sample of 1,376 persons, which the report itself concedes to be unrepresentative of the auto accident population generally. The document also is replete with warnings about the "speculative nature" of the projections of future economic losses (Vol. 1, p. 24), the "substantial" errors in classification (Vol. 1, p. 24), the "arbitrary" criteria used in defining serious injury (Vol. 1, p. 17), and the flat admission that "...the study does not provide reliable estimates of aggregates" (Vol. 1, p. 15). Yet all of the DOT's highly publicized conclusions about the amount of economic loss incurred by auto accident victims, and about the amounts of compensation received from various sources, are based on the "aggregates" which the report says are unreliable.

Even if the figures are taken at face value, a detailed study of the tables leads to different conclusions than those which have been widely publicized. It reveals that nearly all of the so-called "uncompensated compensable economic loss" stems from a small core of catastrophic situations. (See Exhibit 3.)

The startling fact is that 121 persons accounted for 94% of the uncompensated economic losses which the DOT subsequently blew up into billion dollar estimates purporting to measure the "compensation gap." This small group - the "catastrophic few" estimated to have incurred losses exceeding \$25,000 - represents only 8.8% of the DOT's real-life sample of 1,376 crash victims, and fewer than 1% of all auto crash victims.

This means the other 91.2% of the seriously injured group were compensated for all but 6% of their economic losses, as a group.

These findings have great significance in assessing both the present reparations system and the various reforms being proposed.

For example, most of the uncompensated economic loss reported for the "catastrophic few" consisted of future wage losses extending far beyond the 30-month cutoff period found in the Uniform Motor Vehicle Insurance Act. This means the proposed federal bill will fall far short of providing "almost total compensation" for the group of crash victims which accounts for 94% of all the DOT's estimated "uncompensated compensable losses."

The Act proposes to deal with this problem by preserving the right of tort recovery for survivors in death cases and for persons who are more than 70% disabled. But this is rendered largely meaningless by other provisions prohibiting the states from requiring drivers to carry any form of liability insurance to pay for such losses. The high-risk drivers most likely to cause such injuries are the ones least likely to voluntarily purchase liability insurance if existing state financial responsibility laws are abolished, as Senator Hart proposes.

Moreover, the person who has suffered a serious crash injury - a spinal cord injury, for example - will be faced with a cruel choice under this federal bill. Its provisions create a serious disincentive for rehabilitation in the cases most desperately needing rehabilitation care. Many months normally elapse in such cases before the degree of disability is stabilized. In the meantime, the injured person will be left in uncertainty as to whether he will be able to pursue a tort recovery. Should he retain an attorney, and begin preparing his case while witnesses are available, or wait to see if his disability

will exceed the 70% level? In some states, the statute of limitations on filing a claim or a lawsuit may run out before he knows the answer. This gives the injured person a strong financial incentive to regard himself as permanently and totally disabled, and to be classified as such as quickly as possible. How many seriously injured persons, facing an uncertain future, can afford to do otherwise - particularly if he has a family dependent on him for support?

The Uniform Motor Vehicle Insurance Act also creates serious inequities for the much larger group of seriously injured crash victims who suffer permanent disabilities below the 70% level. These unfortunate victims would receive no compensation at all for going through life with some rather serious impairments.

Under the disability rating systems commonly in use today a person may suffer loss of limbs, serious loss of bodily function, deformity, recurring pain and other severe personal damage without being considered 70% disabled. For example, the amputation of an arm is considered a 60% disability of the body as a whole under the American Medical Association's "Guides to the Evaluation of Permanent Impairment." Partial paraplegia also carries a 60% rating so long as the person is able to walk without braces and has complete bowel and bladder control, despite the fact that he may be unable to pursue his previous occupation. In the case of workers who earn their living by manual labor or other jobs requiring physical exertion, disabilities well below the 70% level can mean a drastic change in income for the rest of their lives, in addition to the personal anguish imposed on them and their families.

Or consider another type of disability rating under the Labor

Code of the State of California. California's "Schedule for Rating Permanent Disabilities" rates a complete loss of speech as a 50% disability. The loss of sense of taste and smell is considered a 10% disability. The loss of a thumb and all fingers on one hand is a 55% disability.

There is no completely satisfactory answer to this problem. But at least the Guaranteed Protection program offers everyone who has been injured as a result of someone else's irresponsibility an opportunity to recover full economic losses and general damages for the harm done to the quality of life he may expect as a result of a permanent injury. Under the Uniform Motor Vehicle Insurance Act, large numbers of these permanently impaired victims would not even be entitled to full recovery of their economic losses.

### 3. General Damages

It is argued that general damages should be excluded from compensation because they are subjective in nature and are not susceptible of objective measurement in dollars. Yet the same thing is true of a great many things in this world. How much is a man's time worth, and how is its value determined? Why do we pay higher wages for overtime, night work and holidays, and how is the differential arrived at? How do we determine the value of a piece of real estate condemned for a highway?

All of these things are subjective in nature. Yet we manage to translate them into dollar amounts by a process of bargaining and compromise. Our society not only is capable of translating subjective values into dollars - it insists upon it, and considers it one of the distinguishing features of a democratic society. We do it every time

we negotiate a wage settlement, sign a contract, buy a house or hire the neighbor's kid to mow the lawn.

Auto accident victims insist upon it also. People who have been injured by a negligent driver expect to get paid something for their trouble, pain and inconvenience. Those who have suffered a permanent impairment such as loss of speech or all of the fingers of one hand are even less likely to be satisfied with being paid nothing more than their net economic losses.

#### 4. Delay

One of the major promises made for the Uniform Motor Vehicle Insurance Act is that it would provide prompt payment. However, the feature which makes other benefit sources pay first would tend to create considerable delay in payments by the auto insurer. This would result because the auto insurance policy would be intended to pay only those amounts left unreimbursed after all other benefits had been offset. This would require that the auto insurer determine not only the existence of other collateral benefit sources, but also find out to what extent they had overlaps, deductibles, coinsurance provisions, dollar limits, time limits, exclusions and other features affecting the amounts payable. Accident victims usually would be unable to provide such information until other benefits had been actually received. With the auto insurer being "last in line" to pay, any delays in the payment of benefits by other sources would tend to delay the payment of auto insurance.

Moreover, the bill provides no safeguards to prevent concealment of collateral sources, tax deductions, second jobs and other information which would have to be taken into account in settling claims.

We rejected this approach in structuring the Guaranteed Protection Plan for several reasons. First of all, it is unfair to the prudent man who has provided other forms of protection for himself and his family. Why should this man be denied payment under his auto insurance policy, while the person who has not obtained other coverages would collect? In the case of employee benefits such as group health insurance and wage continuation plans, spokesmen for organized labor regard these union negotiated benefits as compensation received in place of additional wage income. For this reason, total no-fault plans have run into stiff opposition from labor groups in several states as soon as they took a close look at the plans and found out what it would do to their members.

Quite aside from the attitudes of labor and management, why should other benefit systems - private or public - be saddled with the burden of subsidizing highway accidents? As a matter of public policy, motorists as a group ought to pay their own way for the accidents and injuries they caused. We believe it is in the public interest to keep these auto accident costs visible, instead of hiding them by passing on a large part of the expense to taxpayers and purchasers of other insurance coverages.

#### 5. Who Is Left Out?

In numerous hearings over the past three years, and in the steady barrage of press releases issued in behalf of this proposal, major emphasis has been placed on the fact that some auto accident victims fail to receive any compensation under the auto bodily injury liability coverage, and that seriously injured accident victims are sometimes not compensated in full for all of their economic losses.

Careless use of such terms as "the present system" and "the fault system" seem almost calculated to mislead the casual reader into thinking that auto accident victims have no other source of recovery under the present auto insurance system other than by proving that they were totally innocent and the other driver was totally at fault.

In fact, the bodily injury liability coverage is not designed to cover all injuries occurring on the highways. For example, it is not designed to cover the approximately 25% of all auto crashes involving single vehicles, except to the extent that guest passengers have a cause of action against the negligent driver of the car in which he was riding. A majority of these single vehicle crashes involve only the driver, and of course the liability coverages are not designed to pay for such cases.

However, about 70% of private passenger vehicle owners carry medical payments insurance, which pays on a first-party, no-fault basis, even in single vehicle accidents and in cases where the injured person was at fault. Vehicle owners also can purchase first-party, no-fault collision insurance to cover any damage to their own cars, regardless of fault. Thus it is misleading to imply that "the present system" is incapable of providing compensation for crash losses.

If critics of the present system insist on looking only at the statutory coverages, then it is fair to ask how many accident victims would not get paid under the statutory coverages which they propose. Under the Uniform Motor Vehicle Insurance Act, very large numbers of auto accident victims would receive nothing at all from the compulsory personal injury coverages. Nobody would collect for damage inflicted on his automobile under the statutory coverages. Many of those who

have wage continuation plans, sick leave or nonwage income wouldn't collect anything for their lost work time. Those who have health insurance or other medical benefits wouldn't collect from their auto insurance for these expenses either, unless these collateral sources specifically provided that the benefits are secondary to auto insurance.

No doubt it will be argued that these losses are covered by other benefit systems. But the same argument can be made today. The point is, both the present statutory auto insurance coverages and those proposed under this federal act are designed deliberately to leave out certain categories of claimants - and the group left out is much larger under the federal proposal than under the present system.

The Guaranteed Protection Plan would provide broader protection than either the present system or Senator Hart's proposal. It would cover a far larger number of accident victims, and provide benefits more promptly, than the auto insurance coverages specified in the proposed Uniform Motor Vehicle Insurance Act.

#### 6. Coverage Gaps

Another major flaw in the Uniform Motor Vehicle Insurance Act is the provision which would strike down existing state financial responsibility laws. The Plan not only does not cover property damage - it also prohibits states from requiring or strongly encouraging drivers to carry property damage liability for the damage they may inflict on other vehicles. As a practical matter, this means that people whose cars are smashed by negligent drivers are unlikely to be able to collect.

Owners of other property such as houses, commercial property

also would find it much more difficult to collect from negligent motorists than is the case today under state financial responsibility requirements.

Third, people who suffer catastrophic harm at the hands of negligent motorists are likely to find their right to sue largely meaningless, since there is no requirement or sanction on vehicle owners to insure against this liability. All insurance companies would be required to offer such residual liability coverages to their policyholders, but it is quite likely that a high percentage of the most accident-prone segment of the driving population would not purchase it if existing financial responsibility laws are abolished.

#### 7. Is Negligence Still Relevant?

If the Congress enacts the Uniform Motor Vehicle Insurance Act, it will be saying as a matter of public policy that a negligent driver no longer is responsible for the injury and damage he inflicts on other people. The idea of abandoning responsibility is based in part on the assumption that auto crashes are really nobody's fault - that they are more or less random events, the inevitable consequence of a motorized society. But there is strong evidence to the contrary. A startling high percentage of all serious auto accidents involve flagrant driver negligence.

Improper driving is a factor in about 9 out of 10 fatal and injury-producing accidents, according to reports of state and city traffic authorities.

Drinking is the dominant factor in highway fatalities. Studies published by the DOT indicate that drinking plays a part in at least half of the 55,000 annual highway deaths - and in more than 800,000 injuries a year.

Additional evidence on the role of driver negligence is found in a report prepared by the National Highway Accident and Injury Analysis Center of the United States Department of Transportation. Out of 217 accidents studied, 612 factors were identified as contributing to the occurrence of the accidents. These included vehicle defects, roadway defects, bad weather and a variety of other factors.

But 422 of the 612 "accident causation" factors involve human error. And a high percentage of these accidents involve flagrant driver negligence.

In 104 cases, for example, the driver was intoxicated or had been drinking.

In 81 cases, the driver was speeding or going too fast for conditions.

In 19 cases, the driver went through a red light or stop sign.

In the light of all the evidence that has been gathered, the American Mutual Insurance Alliance believes that driver behavior is still a highly relevant factor to the innocent victims who are maimed and to vehicle owners whose cars are smashed as a result of someone else's carelessness. The Guaranteed Protection Plan is based on the premise that driver negligence is still relevant, and must be taken into account to some degree in any reparations system likely to win public approval.

#### 8. Efficiency of the Auto Insurance System

The Alliance agrees with proponents of various auto insurance reform plans that one objective of reform should be to make the auto insurance system more efficient, and to return a greater percentage of the insurance premium dollar to accident victims.

Such an assumption of federal control would be justified only if the states had utterly failed in their job, and there was a reasonable expectation that federal regulation somehow would be immune from the same failings. We see no credible evidence that either of these conditions prevail. There is nothing in the history of the federal regulatory system to instill confidence that federal regulation of insurance would be, on the whole, more efficient than the present state regulatory system. The shortcomings of federal regulation are well documented in a recent book by Pulitzer Prize-winning author Louis M. Kohlmeier, Jr., titled the Regulators. As the jacket succinctly puts it, the book "sheds new light on how the federal regulatory agencies have failed in their purpose - to protect the American consumer." We note that Senator Hart, the principal author of the Uniform Motor Vehicle Insurance Act, has strongly endorsed this book.

The Congressional Record is full of official and unofficial criticism of federal regulatory agencies for their dilatory procedures, their inflexibility, their lack of independence and competency. As a consequence, the public has suffered and the affected industries have suffered. There is at least a reasonable presumption that hide-bound federal regulation is a major contributor to the financial plight of the nation's railroads and airlines and the problems of power and energy shortage with which we are now confronted.

Insurance remains one of the most diverse businesses in the nation. In most respects, it is still a local business, built on local bases and serving local needs. The Alliance believes that the regulation of insurance must recognize and respond to this diversity.

Some critics have spoken of diversity in regulations among the 50 states as though it were prima facie evidence that something is wrong. It is, in fact, evidence that the states are carrying out their intended and constitutionally guaranteed function of serving the diverse interests of their own citizens. To argue that there is something abhorrent, per se, about differences in laws among the various states is to quarrel with the whole concept of federalism and the legitimacy of individual states having independent powers and responsibilities.

The Guaranteed Protection Plan advocated by the Alliance would provide a compatible, rational system in which differences in benefit levels and other aspects of the auto reparations system could be readily accommodated and reconciled as among states.

We take specific note of the fact that an arm of the National Legislative Conference, an affiliate of the Council of State Governments, already has taken action to draft model legislation that would provide a guideline, subject to necessary state variations, for the auto reform plan proposed under the Concurrent Resolution now before this committee.

#### 10. Legal and Constitutional Problems

The proposed Uniform Motor Vehicle Insurance Act raises a number of legal and constitutional issues.

Is it permissible to abolish the right to sue for a bodily injury, and substitute a compulsory requirement that vehicle owner purchase insurance to protect himself?

In the DOT report titled "Constitutional Problems in Automobile Accident Compensation Reform," Professor C. Dallas Sands of the

University of Alabama Law School examined the constitutional issues that might be involved in reform of the auto accident compensation system through federal legislation, and concluded that such legislation might well run afoul of the 7th Amendment, which preserves trial by jury under common law.

In any event, the proposal would be certain to generate a substantial amount of legal controversy and litigation, both to define what the statute means and to resolve continuing disputes among the parties to an action and their insurers.

#### 11. Access to Insurance

One of the politically popular features of the Uniform Motor Vehicle Insurance Act is the provision that would require auto insurers to accept all applicants for coverage, provided they have a valid drivers license and are willing to pay the premiums. The proposal also would prohibit cancellation except for loss of a driving privileges or nonpayment of premium. This presumably is intended to do away with the need for the existing automobile insurance plans, which provide a source of insurance for motorists who are having difficulty in obtaining coverage in the voluntary market.

However, the actual consequences of such a law are likely to be very different than the objectives which the authors of this proposal have in mind. The most likely result would be to increase the cost of insurance for the vast majority of drivers who now enjoy preferred rates, since companies which attempted to set their rates at a low level attractive to such drivers would be inundated by high risk drivers. Such a plan also would create chaos in the market place, as companies sought to avoid attracting the attention of people

from areas known to produce excessive losses. In order to correct these dislocations, the federal regulator would have to become more and more involved in the operational details of marketing insurance - including the appointment of agents, the nature of the advertising done, the availability of visible sales offices, the mailing lists used by those companies using direct mail solicitations, etc.

If the objective is to keep the cost of automobile insurance at an "affordable" level for drivers with above average loss exposure, it would appear that such drivers have more protection under the existing regulatory setup than they would have under the one contemplated in this bill. In New York, for example, where auto insurers are now permitted to use competitive rating for their voluntary business, the rates for drivers insured in the automobile insurance plan remain under a so-called "prior approval" arrangement. Although drivers insured in the Plan are charged higher rates than those available in the voluntary market, there is a deliberate element of subsidy built into the setting of rates for these high-risk drivers. In other words, they do not pay their own way. Under the Uniform Motor Vehicle Insurance Act, insurance companies presumably would be free to charge these high-risk drivers rates commensurate with their actual loss experience, so that their premiums would be even less "affordable" than is presently the case.

The Guaranteed Protection Plan deals with the problem of insurance availability in a more reasonable fashion. It calls for expansion of the present automobile insurance plans so as to guarantee reasonable limits of protection for both liability and other auto insurance coverages to every licensed driver.

Concrete plans for accomplishing this objective were outlined

by the National Industry Committee on Automobile Insurance Plans consisting of representatives of the American Mutual Insurance Alliance and the other two major insurance trade associations, at the 1969 annual meeting of the National Association of Insurance Commissioners in Philadelphia. The necessary changes are now being put into effect by the various states, either by action of Automobile Insurance Plan governing committees or by legislation.

The Alliance supported these changes and, in addition, would support a program which extends beyond the recommendations of the NIC (which include liberalized eligibility requirements, optional medical payments, physical damage coverage, an installment payment plan, and the new name, "Automobile Insurance Plan.") We also support offering 50/100/25 bodily injury and property damage liability limits of protection and more prompt access to coverage under the plans. However, where higher limits are provided, small insurers without adequate reinsurance arrangements should be protected by the mandatory pooling of limits over the financial responsibility limits.

The insurance industry also has improved the availability of coverages by restricting the right to cancel policies. Since 1967, Alliance member companies have agreed not to cancel any private passenger automobile policy except for nonpayment of premiums by an insured, or suspension or revocation of a driver's license or registration. The Alliance Board of Directors voted to seek legislative enactment of "noncancellation laws" restricting the cancellation of private passenger auto policies, except for the two reasons cited above.

The principal stock and mutual rating bureaus have had in effect

-61-

for the past six years a program of voluntary restrictions on the right of members and subscribers to cancel private passenger automobile liability policies. As of January 1, 1968, the right to cancel was further restricted to just two allowable reasons: non-payment of premium, or loss of driving privileges. At the same time, the guarantee against cancellation was extended to other coverages, such as collision, fire and theft.

To make such guarantees effective for all policyholders, some 38 states have now enacted laws providing statutory restrictions on the right of companies to cancel auto insurance policies. The Alliance and other responsible segments of the industry are working to enact similar laws in the remaining states.

#### 12. Changes in Rating Procedures

Proposals for changes in rating procedures under the Uniform Motor Vehicle Insurance Act would not provide the public with meaningful price information, as its authors apparently assume.

As nearly as we can determine from the somewhat vague and confusing description contained in the bill, it is contemplated that the Secretary of Transportation would publish each company's loss experience in great detail, along with the premiums being charged for each category of driver, rating territory, vehicle type and use, and type of insurance coverage.

The trouble is, this type of data has no statistical validity on an individual company basis when subdivided into so many categories. The loss experience would fluctuate so greatly - from one company to another and for the same company at different time intervals - as to be meaningless and misleading for consumers.

This would be especially true of smaller companies. Small companies also would have more difficulty in adjusting to the new system, particularly if - as seems likely - they would be required to perform for themselves many of the services now performed by rating bureaus.

The result very likely would be to promote the growth of large companies at the expense of their smaller competitors, thereby lessening competition and promoting economic concentration of power in an industry which has remained highly diversified and highly competitive up to now.

#### VII. THE FEDERAL GOVERNMENT'S ROLE IN AUTO REFORM

The Alliance believes that the Federal Government has a major role to play in reducing the excessive losses now occurring on the highways, and in bringing about an improved compensation system for automobile accident victims. Indeed, the Federal Government already has made major contributions in these areas.

The massive study conducted by the Department of Transportation, plus the hearings held by this committee and other committees of Congress, have made a major contribution to the efforts to reform the automobile accident reparations system. This research, plus the impetus provided by federal interest in this subject, seems likely to assure that the states will move promptly to conduct the necessary experimentation and evolution of reforms in the reparations system. The Alliance has knowledge of reform legislation pending in at least 35 states. Several of these states are considering alternative reform plans.

The Alliance believes the Federal Government has a more active role to play in the reduction of highway losses - through funding

of research, the funding of safety programs such as the current alcohol countermeasures program of the DOT, and through the vigorous application of vehicle standards designed to reduce the grossly excessive loss being generated by low-speed damage to vehicles and the unnecessary injuries to vehicle occupants. In this connection, the Alliance supports the pending legislation which would give the Department of Transportation specific authority to promulgate standards relating to vehicle damage as well as occupant safety. We also support the concept of rating cars on the basis of their damageability and repairability.

#### VIII. CONCLUSION

The problems generated by automobile crashes are far more complex than was generally realized when the reform issue first came to general public notice two or three years ago. We believe the ensuing research, debate and soul searching has been productive, and has produced something close to a consensus on the steps that must now be taken to bring about a reformed system and to bring under control the excessive losses. The Alliance has been privileged to play a major role in this search for reform. We pledge to you and to the public our continued efforts to accomplish those objectives.

**SUMMARY OF FINDINGS**

Given a choice between Guaranteed Benefits and the benefits available under the existing auto liability system, 25 per cent of claimants elected to accept Guaranteed Benefits in the Illinois Experiment and 15 per cent elected Guaranteed Benefits in the New York Experiment.

Persons who had more serious injuries and economic losses were likely to opt for a liability settlement rather than the Guaranteed Benefits offer. The larger the claim, the more pronounced this tendency became.

Claimants who consulted attorneys were much less likely to accept Guaranteed Benefits than those who did not. However, it is not known whether the decision resulted from the attorney's advice or whether the claimant's decision to consult an attorney was, in itself, an indication that he or she had in mind a settlement larger than that provided under Guaranteed Benefits. Retired persons, housewives, the self-employed and rural residents were more likely than other claimants to elect Guaranteed Benefits.

No definite conclusions can be drawn from this experiment regarding the possibility of savings from adoption of the Guaranteed Benefits concept.

#### BACKGROUND AND OBJECTIVES

The purpose of the Guaranteed Benefits Experiment was to test the reaction of automobile bodily injury liability claimants to this particular alternative method of paying benefits.

At the time the experiment was initiated, in 1968, there had been extensive criticism of the automobile liability insurance system. Numerous proposals had been made for changes in the system which would eliminate some of the uncertainties of a liability claim. The Guaranteed Benefits Experiment was designed to offer liability claimants an opportunity to exchange these uncertainties for the assurance of a known recovery. The benefits were structured so as to offer the injured person a combination of payments which, in most instances, would pay all of his medical expenses, wage losses and other out-of-pocket expenses, plus some additional benefits for permanent impairment or wrongful death. These benefits were to be paid regardless of the fact that the claimant may have had other sources of recovery such as health insurance or wage continuation benefits.

Companies participating in the experiment wanted to know whether claimants having bodily injury claims against their policyholders would be willing to accept these benefits, offered promptly and on a guaranteed basis, or whether they would choose the less certain but potentially higher settlements available if they could prove that the other driver was at fault.

In addition, the companies hoped to gain insight into the cost implications of a Guaranteed Benefits system.

## DESCRIPTION OF THE EXPERIMENT

The Guaranteed Benefits Experiment was conducted during a one-year period in portions of New York and Illinois. The following 16 company groups participated in one or both portions of the experiment in cooperation with the American Mutual Insurance Alliance:

Allstate  
 American Mutual Liability (New York only)  
 Chubb & Son, Inc.  
 Continental Insurance Companies  
 Country Mutual (Illinois only)  
 Economy Fire & Casualty (Illinois only)  
 Employers of Wausau (New York only)  
 Great American (New York only)  
 Home Insurance Company (New York only)  
 Insurance Company of North America (New York only)  
 Kemper Insurance  
 Liberty Mutual  
 National Grange Mutual (New York only)  
 Nationwide Insurance  
 Sentry Insurance  
 Utica Mutual (New York only)

In Illinois, the experiment covered Kane and DuPage Counties, and for some company groups, portions of Lake and suburban Cook Counties. All are in the Greater Chicago metropolitan area, although the western portions of the test area are rural.

The New York portion covered Monroe and Onondaga Counties, including Syracuse and Rochester and their surrounding suburbs plus rural portions of the two counties. Some 3.5 million persons reside in the two test areas.

Claims personnel of the participating companies made Guaranteed Benefits offers to auto accident victims who resided in the test areas and who had valid bodily injury liability claims against policyholders of participating companies. The program did not involve the sale of a new or different product to the insurance-buying public. It was strictly a claims-handling experiment involving the offer of an alternative form of settlement to persons presumed to be entitled to a liability recovery.

Eligible claimants were offered up to \$12,500 in Guaranteed Benefits payments. They could collect up to \$5,000 for medical expenses incurred within one year of the accident. They also could collect up to \$7,500 in additional benefits for wage losses and other damages, including physical impairments. (See Appendix C for details on the benefits).

Ground rules of the experiment called for the insurer of the driver responsible for the accident to contact claimants as quickly as possible and offer to pay their medical expenses up to the \$5,000 limit, without red tape as the medical expenses were incurred. The injured person did not have to make any promises or sign a release to receive these medical benefits.

In addition, the claimsman handling the case offered the injured person a choice of accepting an additional package of optional or elective benefits in exchange for an oral agreement that the amount was satisfactory and he would not make any further claim against the other driver. These additional benefits covered such items as loss of wages, inability to perform usual services such as housework or child care, permanent bodily impairment, and the general inconvenience and pain associated with the injury. A survivor's loss benefit was provided for those who qualified for such benefits under state law. Claimants had 15 days to choose or reject the Guaranteed Benefits offer.

Property damage claims were handled under regular claims-handling procedures in all instances.

### RESULTS OF THE EXPERIMENT

Some 2,890 auto accident victims took part in the Guaranteed Benefits Experiment - 587 in Illinois and 2,303 in New York.

In essence, these claimants were asked to evaluate the attractiveness of a guaranteed payment covering their full economic losses, payable as the wage losses and expenses accumulate, in contrast with the possibility of obtaining a greater recovery by pursuing a regular liability claim.

The principal finding is that given a choice between the Guaranteed Benefits offer and the payment available under the existing auto liability system, 25 per cent of eligible claimants elected to accept Guaranteed Benefits in the Illinois Experiment and 15 per cent elected Guaranteed Benefits in the New York Experiment.

Since the experiment was conducted by claims personnel of the participating companies, it inevitably gauged the reaction of such personnel to an alternative compensation method within the environment of the present tort-liability system. The degree of acceptance varied considerably among individual claimmen and this was reflected in the success they had in obtaining acceptances of the Guaranteed Benefits offers. In addition, the experiment had to compete to some extent with other claims-handling programs being heavily promoted by participating companies, notably some sophisticated forms of "advance payment" settlements.

Because of these factors, it is reasonable to assume that the percentages of acceptance obtained in the experiment represent minimum figures.

The following considerations appear to have been the major factors affecting claimant decisions to accept or reject Guaranteed Benefits offers (See Appendix B for tables 1-4):

1. The involvement of an attorney prior to the claimant's decision almost always led to a rejection of the Guaranteed Benefits offer. Roughly one-quarter of claimants were not consulted directly by the insurer - i.e., first notice of the claim to the insurer came from the attorney himself. In an additional one-third of the cases (proportions vary somewhat between New York and Illinois), the claimant retained an attorney after the Guaranteed Benefits offer was made but before a decision was made to accept or reject it. However, it is not clear whether the attorney influenced the decision or whether the claimant's decision to retain an attorney was, in itself, an indication that he or she had in mind a settlement larger than the Guaranteed Benefits offer. (See Table 2)
2. The size of the claim was an important determining factor. The larger the claim, whether measured by economic loss, the potential liability recovery or the amount available under Guaranteed Benefits, the less likely the claimant was to accept the Guaranteed Benefits offer. (See Table 3)
3. Money, as expected, was an important consideration. The greater the contrast between the claimant's perceived potential liability recovery and the amount he expected to receive under Guaranteed Benefits, the less likely the claimant was to accept Guaranteed Benefits. (See Table 4)

4. The Claimant's economic station in life was of major significance. Claimants without earnings such as retired persons and housewives were more apt to elect Guaranteed Benefits than those earning an hourly wage or salary income. This may be due to the fact that Guaranteed Benefits provides an inducement in the form of minimum disability benefits for those with little or no wage loss (Guaranteed Benefits pays \$9 per day for persons unable to do housework or attend school). The self-employed also had higher than average tendency to accept Guaranteed Benefits. (See Table 3)
5. Claimants residing in rural areas were more likely to accept Guaranteed Benefits than claimants residing in urban areas. (See Table 3)

No definite conclusions can be drawn from this experiment regarding any possible savings that might result from the adoption of Guaranteed Benefits or some modification of the concept. Some savings appear to have been realized in the experiment in the minority of cases where the claimants elected to accept Guaranteed Benefits. This is based on claims personnel estimates of what would have been paid in those same cases on a tort liability basis (See Table 4). However, it is evident that offers were not made in all instances where liability was not clear. Savings with respect to those who elect Guaranteed Benefits could be offset or more than offset by additional costs for those who might accept Guaranteed Benefits in situations of uncertain liability, in the absence of any other cost-reducing measures.

## CONDUCT OF THE EXPERIMENT

The Guaranteed Benefits Experiment was based on research conducted over a period of six years by the American Mutual Insurance Alliance, a national trade association of more than 100 mutual companies writing such coverages as auto and fire insurance, workmen's compensation and general liability. However, companies participating in the field testing of the concept represent a broad cross-section of the entire auto insurance business.

Committees representing member and nonmember companies planned and carried out training sessions for claims personnel in Chicago and in Rochester. A Technical Subcommittee designed the forms and procedures used to gather the pertinent statistics. Local claimsmen filled out the forms on each accident and claimant. A short form was used where injuries were minor. Demographic information collected on this form was limited. A long form was prescribed for the more serious cases.

All forms were forwarded to the Alliance, and were checked for accuracy, consistency and compliance with the rules of the experiment, to the extent that such checking was possible. Coding sheets were prepared from the detail on the forms and were submitted to the Judson Branch Center of the Allstate Insurance Company in Menlo Park, California. Here the data were key-punched and processed on the computer.

Tabulations in accordance with schedules prescribed by the Technical Subcommittee were prepared as print-outs from the computer and furnished to the Subcommittee. The Subcommittee reported that "It is clear from the print-outs and from discussions with the persons responsible for preparation and checking of forms, that 100% accuracy was not obtained with respect to the detail or the compliance with experiment rules. Nevertheless the Subcommittee and Staff have examined the results (as furnished) carefully and feel that the conclusions set forth herein are fully warranted."

## Appendix B

## ADDITIONAL DATA

The tables contained in this section are based on the tabulations described in Appendix A.

Table 1

## ACCEPTANCE OR REJECTION OF GUARANTEED BENEFITS

<u>Location</u>	<u>Accept GB</u>	<u>Reject GB</u>
Illinois	145 (24.7%)	442 (75.3%)
New York	335 (14.6%)	1,968 (85.4%)

Table 2

## CHIEF FACTOR AFFECTING CLAIMANT DECISION

Cases With & Without Attorney Compared with Over-All Acceptance Ratio

<u>Illinois</u>	<u>Persons Involved in Decision</u>	<u>New York</u>
222%	Self	253%
100%	(Over-All Average)	100%
25%	Attorney	37%

A technique of analysis was used in Tables 2 and 3 to highlight the more significant factors affecting claimant decisions to accept or reject the Guaranteed Benefits offers. The average acceptance ratio is expressed as 100%. Table 2 indicates that when the claimant made up his own mind he was more than twice as likely to elect Guaranteed Benefits as the average for all claimants. On the other hand, when an attorney was involved in the decision-making process, the claimant was only about one-third as likely to elect Guaranteed Benefits as the average. As noted in the Summary of Findings and in item #1 on page 7, however, the claimant's decision to retain an attorney in the first place may indicate that he

had already decided to seek compensation in excess of the medical expenses, wage losses and other benefits available under Guaranteed Benefits.

In assessing both Tables 2 and 3, it should be noted that some of the percentages are based on very limited samples, particularly with respect to Illinois data. For example, in the Illinois data for Table 2, only 17 persons made their own decisions; the figure is 66 for those consulting an attorney.

Table 3

OTHER MAJOR FACTORS AFFECTING ACCEPTANCE OR  
REJECTION OF GUARANTEED BENEFITS

<u>Illinois</u>		<u>New York</u>
	<u>Size of Loss</u>	
165%	\$1 - \$40	226%
100%	(Over-All Average)	100%
83%	\$41 and Over	82%
	<u>Economic Station</u>	
135%	Retired, Housewives & Self-Employed	218%
100%	(Over-All Average)	100%
88%	Salary or Hourly Wage Earner	84%
	<u>Urban-Rural Environment</u>	
140%	Rural - Kane County	---
100%	(Over-All Average)	---
67%	Urban - Cook County	---

Table 4

## COST COMPARISONS

Actual and Estimated Settlements for GB and Liability Cases

Illinois	<u>GB Accepted: Average GB Settlement</u>	<u>Estimated Liability Value of Same Cases</u>	<u>Difference in Value</u>
	\$241	\$304	-\$63
	<u>GB Rejected: Av. Liability Settlement</u>	<u>Estimated Value of same Cases Under GB</u>	<u>Difference in Value</u>
	\$992	\$384	+\$608

---

New York	<u>GB Accepted: Average GB Settlement</u>	<u>Estimated Liability Value of Same Cases</u>	<u>Difference in Value</u>
	\$438	\$499	-\$61
	<u>GB Rejected: Av. Liability Settlement</u>	<u>Estimated Value of Same Cases Under GB</u>	<u>Difference in Value</u>
	\$1,017	\$426	+\$591

Table 4 illustrates the fact that acceptance of Guaranteed Benefits was higher in the small-value cases. It also shows that when Guaranteed Benefits was elected there was an estimated savings averaging about \$60 per claim, as compared with what the settlement would have been on a tort-liability basis. On the other hand when Guaranteed Benefits was rejected the claimant received, on the average, between two and two-and-a-half times as much as if he had accepted Guaranteed Benefits.

It seems clear that claimants, or those upon whom they rely for advice, can identify those situations in which the tort-liability system offers a greater reward. In general, they are the larger cases, involving more serious injuries and economic losses.

DESCRIPTION OF BENEFITS - APPENDIX C

## Here's How the Plan Works

Under the Guaranteed Benefits plan now being tested in Illinois and New York, auto accident victims who have valid bodily injury liability claims against policyholders of the participating insurance companies are being offered the benefits outlined in the six payment provisions below.

The over-all limit per injured person is \$12,500, including \$5,000 in medical benefits plus \$7,500 under one or a combination of all other categories. The medical benefits will be paid automatically to all eligible persons. The additional benefits will be paid to those persons who elect to accept them and who promise orally to make no further claim against the other driver.

### 1. Medical Benefits

Eligible persons will be paid up to \$5,000 for their reasonable and necessary medical expenses incurred within one year from the date of the accident, including up to \$1,000 for funeral expenses. These benefits will be paid even if the injured person has accident and health or hospitalization insurance. However, those persons who are entitled to auto medical payments and Guaranteed Benefits from the same insurance company will collect the auto medical payments first, then collect under the Guaranteed Benefits plan for any additional medical expenses up to \$5,000.

### 2. Basic Disability Benefits

Basic disability payments are intended to sustain the injured person and his family during the period of disability. Payments start as soon as the injured person elects to accept the Guaranteed Benefits option. They continue on a regular basis for as long as 12 months, and are pegged at 70 per cent of the claimant's usual wage. The maximum benefit per week may not exceed 125 per cent of the average weekly wage in the injured person's state of residence, and the total amount paid under this provision may not exceed \$7,500.

### 3. Loss of Services Benefits

This is an alternative to Basic Disability Benefits for persons who are generally not wage earners. Those who choose this alternative may collect 70 per cent of the cost of hiring someone to perform

their usual services during the disability period. Their inability to perform these services must be medically certified. A minimum payment will be made even if the family manages to get along without hiring anyone. Payments may continue up to one year or \$7,500.

### 4. Supplemental Disability Benefits

When the injured person's disability payments end, he or she receives an additional lump-sum payment amounting to 50 per cent of all the money already received under either the Basic Disability Benefits or the Loss of Services Benefits. This lump-sum payment will not be less than \$35 for each week the injured person was receiving disability payments. This extra payment is to compensate accident victims for the inconvenience and discomfort associated with their involvement in an accident. The combination of the disability payments plus this lump-sum benefit will more than reimburse most claimants for their actual losses. And all of the benefits are tax-free.

### 5. Medical Impairment Benefits

A lump-sum payment may be made for permanent disabilities such as loss of a finger. Guidelines devised by the American Medical Association are used to determine the percentage of impairment remaining after the injury has healed. The amount due will be figured by applying this percentage to a \$7,500 limit. Payments already made under the Supplemental Disability section will be deducted, and no payment will be made for impairments which amount to less than \$100.

### 6. Survivor's Loss Benefits

If an injured person dies within one year of the accident as a result of injuries received in the accident, the other driver's insurance company will pay a lump sum of \$5,000 for the benefits of persons who qualify for the survivor's benefits under state law. This payment is for the loss of income or services of the decedent. The \$5,000 will be paid in addition to any other Guaranteed Benefits which may have been paid, except that the total of all Guaranteed Benefits may not exceed the over-all limit of \$12,500.

The over-all limit of \$12,500 per person for all Guaranteed Benefits combined is sufficient to cover the losses sustained by all but a small percentage of auto accident victims. The few persons whose bodily injury losses greatly exceed this figure presumably will seek larger settlements under traditional claims procedures, if they can prove that the other driver was at fault.

Critique and Analysis  
of  
Public Attitudes Toward Auto Insurance  
  
A Report of the Survey Research Center  
Institute for Social Research  
The University of Michigan  
  
to  
  
The Department of Transportation

Background

On March 28, 1970, the DOT released its report on a survey of public attitudes toward auto insurance.

The survey was done by the Survey Research Center of the University of Michigan and is one component of the Auto Insurance and Compensation Study being conducted by DOT. The report is based on data collected through personal interviews with 3,075 respondents who were mostly heads of families in a national cross-section sample of dwellings, excluding Alaska, Hawaii, and D.C. Most of the analysis concerns the 2,534 families who owned cars.

Two samples of approximately equal size were drawn; one was interviewed between the middle of May and middle of June and the second between August 7 and September 10, 1969. Modern probability sampling with callbacks and household designation was used, thereby minimizing the bias of population restriction - i.e. the size and character of the population to be sampled. Even the use of modern probability methods, however, result in about 15% of the population being excluded (e.g., those institutionalized, hospitalized, homeless, transient, the military, mentally incompetent, etc.) plus those who refuse to answer; are unavailable after their callbacks, or have moved to no known address.<sup>1</sup>

Moreover, use of interviews and questionnaires (the basic tools of 90% of social science research) can introduce a foreign element into the social setting they would describe. They can create as well as measure attitudes.<sup>2</sup> The data collection can stimulate an interest the respondent did not previously feel - thereby distorting the results.

Webb lists the following sources of invalidity connected with the use of all interviews and questionnaires:

1. The probability of bias due to respondent's awareness of his subject status. If people feel they are being "tested," the method of data collection stimulates an interest the subject did not previously feel, the measuring process may distort the experimental results.
2. The respondent's awareness of the interview process produces differential reaction (role selection) involving not so much dishonesty but rather a specialized selection from among the many "true" selves or "proper" behaviors available in any respondent.

- 
1. Stephen, F.F. and McCarthy, P.J. Sampling Opinions, New York: Wiley, 1958. Also, Ross, H.L. "The Inaccessible Respondent: A Note on Privacy in City and Country," Public Opinion Quarterly, 1963, 27, 269-275.
  2. Webb, et al. Unobtrusive Measures: Nonreactive Research in the Social Sciences, Rand McNally and Company, Chicago, P. 1.

3. Measurement as a change agent. This is the "preamble effect" where attitudes created in one part of the interview are carried over into another section.
4. Tendency of respondents to endorse a statement rather than disagree with its opposite and a preference for strong statements.
5. Error from investigator. The interviewer is an important source of cues to the respondent, and he helps to structure the demand characteristics of the interview. There is strong evidence that a substantial number of biases are introduced by the interviewer, such as interaction of age, sex, etc.
6. Change in the research instrument (the interviewer). In other words, to what degree is the interviewer the same research instrument at all points of the research? He may read "heavier" a second time. His skill may increase. He may be better able to establish rapport. He may loaf or become bored. He may have increasingly strong expectations of what a respondent "means." There is, therefore, always the risk that the interviewer will be a variable fitter over time and experience.

These biases are common to all interview and questionnaire survey techniques. Some of these, plus others peculiar to the DOT survey which we will enumerate later, strongly influenced certain key findings presented in the report.

#### Index of Satisfaction And Dissatisfaction With Automobile Insurance

As its starting point, the DOT study utilized an Index of Satisfaction to determine the level of satisfaction and dissatisfaction with the auto insurance system among respondents surveyed. This is a valid method which is used to control variance of data and which the researchers felt would give more satisfactory indications of underlying attitudes than do responses to single questions or to one generic question.

According to the Index, 63% of respondents were satisfied to various degrees and 21% dissatisfied, with 16% neutral. Or to put it another way, 79% were not dissatisfied with auto insurance. This index took into account such "dissatisfiers" as delayed claim payment, cost of auto insurance, cancellations and nonrenewals and general dissatisfaction with the system.

These results were contrasted with responses recorded toward the end of the interview, after various features of the present auto insurance system were discussed with the respondents, which indicated that more people would be in favor of a "no-fault" system of insurance than in favor of the prevailing "fault" system.

Specifically, 44% opted in favor of claiming damages from their own insurance company only and receiving no compensation for pain and suffering, irrespective of which party was at fault. On the other hand, 36% opted for the current system. These percentages were based on an Index of Insurance System Preference utilizing responses from the last three questions in the questionnaire which purported to measure specific and general public attitude towards a "no-fault" system.

The important question to ask is this: What caused the alleged "change in attitudes"? There is strong internal evidence in the survey questionnaire that the manner in which the "no-fault" questions (A67, A68 and A69) were structured strongly biased the response elicited.

In the last analysis, all data must be elicited with questions. Simply put, the nature of the questions will determine what kind of data you get from respondents.<sup>3</sup> Questions A67, A68 and A69 are particularly open to serious question since they are either incomplete or erroneous in describing the system about which they seek to measure attitudes. Moreover, they are of the structured variety which presents the respondent with fixed response alternatives. Structured questions are considered to be potentially more reactive, i.e., prone to bias than the "free response" type which were used in finding out what people thought about the present system.<sup>4</sup>

A close examination of the structure of these three key questions used to construct the Index of Insurance System Preference shows the following:

Question A67 describes for respondents a "no-fault" system which "in case of an accident your losses, including damage to your car, would be paid by your own insurance company, no matter whether you or the other driver were at fault." The question is misleading in that it does not indicate that major total no-fault proposals being put forth require the buyer to carry collision insurance to pay for damage to his car that would have been covered if a negligent driver damaged his car under the present system. The abolishment of 3rd-party property damage liability is in fact one of the big "cost-saving" features of no-fault plans like AIA and Stewart-Rockefeller and Keeton-O'Connell.

Question A68 offers the respondent a choice between two kinds of auto insurance (fault and no-fault) which would cost about the same and asks which he prefers. However, in describing the choices, "pain and suffering" was not adequately defined, the fact that no-fault involves collateral source offset was not mentioned, and how damage to vehicles would be handled was not mentioned. Also, in describing the fault system, mention of any 1st-party coverage was explicitly excluded.

---

3. Backstrom, Charles H., and Hursh, Gerald D., Survey Research; Northwestern University Press, 1963, pp. 66-110.

4. Webb, et al., p. 33.

Moreover, it's unfortunate that the choice was between fault and total no-fault, since there are other plans (such as the Alliance's Guaranteed Protection Plan) which seek to lessen dependency on fault and make other beneficial changes in the system without scrapping it completely. The researchers, as many research organizations do, could have consulted industry sources on structuring the questionnaire without compromising its integrity. It's unfortunate they did not and that an opportunity to gain valuable insights into consumer attitudes was wasted. However, we do get a glimpse of what the consumer wants in the way of change, since those respondents who perceived a need for change proposed a reduction of dependency on fault and wider use of the comparative negligence law approach.

Question A68a asks for a preference between a no-fault system which costs less than the present system, and the present system, both as described by the interviewer. Again, the answer would be highly biased since the key questions leading up to this choice were erroneous, misleading or both. Also, it was strongly implied that no-fault definitely would cost less.

Question A69 asks if respondents would opt for cost reductions if pain and suffering were eliminated without describing just what pain and suffering is. The question also implies that no-fault would automatically take care of vehicle damages without collision insurance being carried. Also conspicuous by its absence is any statement that would have given respondents a chance to comment on their attitudes towards no-fault with its "benefits" as described, but at a higher price - although some respondents did volunteer the information that they thought no-fault would be more expensive than fault.

To summarize, the questions which determined the Index of Insurance System Preference were poorly structured, misleading or incomplete. Two key elements - pain and suffering and vehicle damage - were mishandled in their presentation. These strong internal biases, plus other internal and some external ones we will indicate later, probably account more for the so-called change in attitudes of respondents from the ones they felt at the beginning of the interview. It seems then that the internal invalidity associated with the interview process set into motion attitude changes (between beginning and end of interview) which would not have otherwise occurred. That "change" did occur is probably, in the words of Webb, a "measurement-produced artifact,"<sup>5</sup> and therefore invalid.

The damage done to the survey's credibility in the areas mentioned also extended to giving the impression to young drivers that no-fault would result in lower premiums and to insureds who had been cancelled that no-fault would somehow assuage the market problem. (See DOT Study pp. 80-81.) Significantly, these groups (34% of young drivers and

66% of these cancelled who found difficulty obtaining new coverage) expressed strong favor for a change in the system, probably in the mistaken impression that no-fault would solve their particular problems.

One of the most interesting insights into public attitudes toward the present system, and the various improvements that might be made, is found in the supplementary tables on page 125. When respondents were asked an open-ended question ("In your opinion, is there a need to change this system? In what ways?"), more than two-thirds - 68% of all respondents - did not express a preference that the system be changed.

Among those who indicated a need for change, 10% indicated some degree of interest in lessening dependence on fault. As the document itself puts it, "modify so that everyone collects regardless of who is at fault, or so that dependency on proving fault is reduced." (Emphasis added.)

Another 10% said, "improve the way in which fault is determined and/or compensate claimants in (inverse) proportion to their degree of fault in an accident." Four percent said "let each company take care of its own insured," and the remaining answers were scattered.

This is hardly a ringing endorsement of an all-out change to a no-fault system. It does appear to support some change toward lessening dependence on fault, and toward adoption of the comparative negligence concept in determining amounts of compensation.

Critique and Analysis of  
"Economic Consequences of Automobile Accident Injuries"  
(DOT Serious Injury Study)

I. SCOPE OF THE STUDY

The foreword to this two-volume study describes it as "the most comprehensive and carefully conducted study of the plight of people injured by motor vehicles ever produced." And the news release issued at the time the study was released on April 28, 1970, said it "represents approximately 500,000 fatalities and seriously injured persons."

In fact, the scope of the study is considerably more narrow than these statements would imply. This is not a study of 500,000 persons, nor even 5,000. The billion-dollar estimates, and the thousands of persons listed under various categories, are in fact based on interviews with only 1,376 accident victims or their survivors.

Moreover, this is not a sample of all people injured in motor vehicle crashes, as the title seems to indicate. The study is confined to a tiny segment of the auto accident universe - those persons who incurred medical expenses exceeding \$500, were hospitalized for two weeks or longer, missed three or more weeks of work or, if not working, missed six weeks or more of normal activity. This group of "seriously injured" persons represents about 10% of all persons injured in vehicle crashes, and has characteristics which differ markedly from motorists in general and from the other 90% of auto crash victims. For example, from other DOT reports we

know that more than half of all drivers killed in auto crashes are drunk. Males between the ages of 15 and 44 constituted 20% of the population at the time of the survey, but incurred 39% of the serious injuries and fatalities. And a cross-check with other DOT studies and insurance industry data indicates this tiny group had available far less insurance protection of all kinds than the population generally. (It is quite possible, of course, that the interviews simply did not obtain accurate information on the insurance they had, in which case the estimated payments they received are grossly understated.)

For all of these reasons, and others, the "Economic Consequences" study does not present a valid picture of how the auto accident reparations system performs, nor how well auto crash victims fare as a total group. As will be demonstrated below, the study does not even present a valid picture of what happens to the small group of seriously injured persons represented in the sample of 1,376.

## II. ACCURACY OF THE DATA COLLECTED

Public statements made by the DOT staff and others concerning this study have emphasized the finding that persons killed or seriously injured in 1967 highway crashes had aggregate "compensable" economic losses of \$5.1 billion, and received only \$2.5 billion in aggregate compensation from all sources. Similar comparisons are made for numerous sub-categories within the 1,376-person sample.

All of these comparisons - which have been widely published and cited as evidence that the present auto insurance system is a failure - depend on the accuracy of both the raw data collected and the aggregates

based upon it (and blown up to 370 times life-size).

Yet the report itself is replete with warnings about the "speculative nature" of the projections of future losses (Vol. 1, p. 19), the "substantial" errors in classifying the various individuals (Vol. 1, p. 24), the "arbitrary" criteria used for defining serious injury (Vol. 1, p. 17), and the candid admission that "... the study does not provide reliable estimates of aggregates" (Vol. 1, p. 15).

In short, the DOT chose to publicize the least reliable findings, and to attribute to them a significance which goes far beyond the level of confidence expressed about them by the professionals who actually conducted the research.

#### 1. Verification of Losses and Payments

Confidence in the entire study is further undermined by the fact that the basic raw data was derived from largely unverified estimates of losses and payments stemming from accidents that occurred more than two years prior to the interviews. In this connection, it is interesting that the U.S. Public Health Survey tosses out all data based on events more than 90 days old, having found that recollection of details beyond that point are less reliable. As the report notes in the foreword, these are "events the respondents surely would rather relegate to the recesses of their minds."

In view of this, it is surprising that there was so little verification of the actual losses and payments received, even though most respondents gave permission for such verification. For example, no attempt was made to verify with insurance companies

the amounts paid to these crash victims under various coverages. Nor was any attempt made to determine whether there was full reporting of amounts received from all sources. Information used to estimate wage losses would appear to be particularly vulnerable, since only 208 replies were received from employers, and only 57 of those replies were actually used.

This criticism does not in any way imply that respondents deliberately falsified their replies. It simply calls into question the decision to accept as completely accurate the respondents' estimates of the economic losses they incurred and the exact amounts of compensation they received from 7 or 8 possible sources, for auto crashes which occurred more than two years previously.

## 2. Under-Reporting of Benefits Available

Independent evidence suggests that the reporting of compensation received from these multiple sources was substantially understated.

For example, the DOT data indicate that about 65% of the respondents were covered by medical and hospital insurance, and only 51.4% of the seriously injured collected something from medical insurance. But the Health Insurance Institute reports that 85% of the U.S. population is protected by one or more forms of private health insurance.

Only 54% of the respondents reported they had auto medical payments coverage, and only 37.9% indicated they were paid anything from this source. But the DOT study of public attitudes indicates that 78% of the motoring population have auto medical payments coverage - a figure which jibes with insurance industry estimates.

Only 62% of the fatalities in this study had life insurance, according to the DOT, whereas a nationwide survey for the Institute of Life Insurance indicates 71% of Americans own at least one type of life insurance.

Only 29% of the respondents said they collected anything under the auto collision coverage, but the DOT public attitudes study shows that 77% of the motoring public has such protection.

These discrepancies may be explained in part by the difficulties which many respondents may have had in accurately recalling events that occurred more than two years previously. Some part of the problem may also be due to the DOT staff's lack of understanding of the various forms of insurance and what they cover. For example, this report shows no benefits paid under the auto medical payments coverage for instant death cases, apparently because the staff was unaware that the auto medical payments coverage pays funeral expenses.

### 3. Statistical Credibility of the Study

Another major problem affecting the credibility of the findings has to do with the statistical credibility of the detailed comparisons among various subcategories. The overall sample of 1,376 is relatively small to begin with. When this sample is subdivided into dozens of smaller categories, the numbers of persons falling into many of these categories are so low as to have very low credibility. Yet this study blows up the results obtained from subsamples as small as 13 persons into national projections, and draws conclusions based on such data.

In all fairness, it should be noted that the professionals

who did the statistical work pointed out that the margin of error increases enormously as the sample is subdivided. But the fact that the figures are multiplied by 370 tends to conceal just how thin some of the data really are. And those who are using this study to castigate the present auto reparations system have tended to ignore the cautionary statements and qualifications buried in the 677 pages of this study, and have accepted at face value the damaging "findings" which suit their purposes, whether they have any statistical validity or not.

### III. INTERPRETATION OF THE DATA

Several questionable assumptions are implicit in the public statements made about the findings of this study, and in the basic conception of the report.

#### 1. Definition of "Compensable Economic Loss"

The lead line of the news release issued upon publication of this study says, "Auto insurance repaid only one-fifth of the \$5.1 billion compensable losses resulting from deaths and serious injuries in 1967 automobile accidents...".

Obviously, the definition of "compensable economic loss" is critical, since this is the yardstick used to measure both the performance of the auto insurance system and how the injured persons fared.

In devising this yardstick, the DOT deliberately excluded all compensation for disfigurement, permanent impairment, suffering and other general damages that go beyond direct economic losses such as medical expenses and lost wages.

On the other hand, the DOT assumed that all economic losses sustained by heads of families as a result of auto crashes should be fully reimbursed for the rest of their lives - a goal never attempted nor achieved by any compensation system in our society, including those established by government for persons injured in public employment and for persons killed or injured in military service.

The DOT's public statements about this study also implies that the auto insurance system ought to be expected to absorb all of the losses defined as "compensable" by the DOT, regardless of the circumstances of the accident, the economic status of the injured person, the availability of other sources of compensation and the existence of statutory provisions such as wrongful death limits.

These are, at best, questionable assumptions.

Moreover, in preparing its unverified estimates of future wage losses, the DOT made no adjustments for income taxes, remarriage of widowed spouses, the decreased life expectancy of seriously impaired persons, the expenses that the persons would have incurred in earning that future income, nor a number of other factors which might reasonably be considered in determining which losses should be "compensable."

who did the statistical work pointed out that the margin of error increases enormously as the sample is subdivided. But the fact that the figures are multiplied by 370 tends to conceal just how thin some of the data really are. And those who are using this study to castigate the present auto reparations system have tended to ignore the cautionary statements and qualifications buried in the 677 pages of this study, and have accepted at face value the damaging "findings" which suit their purposes, whether they have any statistical validity or not.

### III. INTERPRETATION OF THE DATA

Several questionable assumptions are implicit in the public statements made about the findings of this study, and in the basic conception of the report.

#### 1. Definition of "Compensable Economic Loss"

The lead line of the news release issued upon publication of this study says, "Auto insurance repaid only one-fifth of the \$5.1 billion compensable losses resulting from deaths and serious injuries in 1967 automobile accidents...".

Obviously, the definition of "compensable economic loss" is critical, since this is the yardstick used to measure both the performance of the auto insurance system and how the injured persons fared.

In devising this yardstick, the DOT deliberately excluded all compensation for disfigurement, permanent impairment, suffering and other general damages that go beyond direct economic losses such as medical expenses and lost wages.

On the other hand, the DOT assumed that all economic losses sustained by heads of families as a result of auto crashes should be fully reimbursed for the rest of their lives - a goal never attempted nor achieved by any compensation system in our society, including those established by government for persons injured in public employment and for persons killed or injured in military service.

The DOT's public statements about this study also implies that the auto insurance system ought to be expected to absorb all of the losses defined as "compensable" by the DOT, regardless of the circumstances of the accident, the economic status of the injured person, the availability of other sources of compensation and the existence of statutory provisions such as wrongful death limits.

These are, at best, questionable assumptions.

Moreover, in preparing its unverified estimates of future wage losses, the DOT made no adjustments for income taxes, remarriage of widowed spouses, the decreased life expectancy of seriously impaired persons, the expenses that the persons would have incurred in earning that future income, nor a number of other factors which might reasonably be considered in determining which losses should be "compensable."

## 2. Interpretation of Averages

One of the most widely-quoted "findings" of this study is that, "On the average, about half of the total personal and family economic loss was recovered" from any source. But a detailed study of the tables reveals the startling fact that only 121 persons (out of the total sample of 1,376) accounted for 94% of the gap between the DOT's estimate of "compensable" economic loss and the compensation reported by respondents.

In short, nearly all of the "uncompensated" loss stems from a small group of catastrophic situations - i.e., those crash victims estimated to have incurred economic losses exceeding \$25,000. This small group represents only 8.8% of the real-life sample of 1,376 crash victims, and fewer than 1% of all auto crash victims.

This means the other 91.2% of the seriously injured group were compensated for all but 6% of their economic losses, as a group.

## 3. Information Omitted

The disproportionately high losses sustained by the "catastrophic few," who account for 94% of the total uncompensated loss, raise questions about the omission of relevant information on the circumstances of these catastrophic situations. It is impossible to get answers from these published volumes as to why these individuals were not reimbursed.

There is no explanation in the report as to why this vital information was withheld, while other less useful information is reported in great detail. For example, why was it decided to withhold information on the number of seriously injured persons who did not recover from auto insurance because they were injured in single-vehicle crashes,

or were at fault, or had neglected to purchase auto medical payments and collision insurance? How many had neglected to purchase health insurance, life insurance or other available forms of protection? Obviously, these factors have a direct bearing on the reimbursement received by this highly selected group of crash victims.

Finally, it would appear that all of the shortcomings attributed to the recovery systems for auto accident victims apply with equal or even greater force to the recovery systems available to persons injured or killed in other ways. In fact, this study indicates that auto accident victims are better protected already than most other categories of injured persons.

Proposed improvements in the present system, such as those outlined in the Guaranteed Protection Plan of the American Mutual Insurance Alliance, would further improve the protection available to auto crash victims.

From 1971 Ohio Insurance Facts, Ohio Insurance Institute

Senator HART. Now we will have the testimony reflecting the point of view of the Automotive Parts and Accessories Association, Inc., and I am glad that its president, Mr. Donald Schlenger, is here.

**STATEMENT OF DONALD S. SCHLENGER, PRESIDENT, AUTOMOTIVE PARTS AND ACCESSORIES ASSOCIATION, INC.**

Mr. SCHLENGER. Mr. Chairman, my name is Donald Schlenger. I am grateful for the opportunity and privilege of appearing before this committee today as spokesman for the segment of the automotive aftermarket industry served by the Automotive Parts and Accessories Association, Inc. I am the president of the association and am president of Roth-Schlenger, Inc., of Union, N.J., a regional chain of home and auto stores and leased departments in the East and Midwest.

The segment of the industry I refer to as being served by the association is primarily the retail segment or what is sometimes referred to as the volume segment of the automotive aftermarket. Essentially, we provide automotive merchandise and services directly to the motoring public through retail stores, typified prominently by the Sears and Western Auto Stores across the country. There are well over 50,000 establishments of this type, and the companies that own them are, in part, members of our association. The size of these establishments vary considerably to be sure, but they are for millions of motorists, the principal source of automotive merchandise, service, and information.

We are not affiliated with car dealers, service stations, or garages that also sell at retail. Uniquely, to my knowledge, we are the only association in this field that includes in its membership not only the outlets that typify the market it serves, but also includes, with full equity, the manufacturer who sells directly to the retailer and the wholesalers that supply the market's smaller outlets. We also have, as full memers, many independent sales agents—and other service companies such as publishers, ad agencies, consultants—that are significantly involved in this particular segment of the market.

So, you see, we are a very broad-based, multirepresentational group of automotive aftermarket businessmen. This structure, I might add, lends our association a growth and influence potential to be reckoned with in all automotive quarters.

We are Washington, D.C. based, and we have expert staff and counsel here that make our membership among the best informed national voluntary membership bodies in this field—which brings me to the subject at hand with what I hope is a clear picture, in the committee's view, of the specific interest our association has in this legislation.

We will limit our comments to title V, entitled Diagnostic Inspections, Registrations and Titling Standards, wherein it states in section 501(a) (1) :

The standard shall require inspection of a motor vehicle whenever the title to the motor vehicle is transferred for purposes other than resale, and whenever the motor vehicles, automotive repair parts or accessories: Provided, subsystem, or functional nonoperational part, as defined by the Secretary, is damaged.

I believe that since the condition of a vehicle is a significant contributory factor in many accidents, it seems to me that a first and foremost legislative obligation to improve the national vehicular

safety picture would be to write, as you gentlemen have, a law requiring inspections that is absolutely binding on anyone that sells a car to a user, whether that car be a new one or a used one. Certainly, after a car has been in an accident, it should be inspected before it is allowed back on the road.

Hand in hand our concern for safety on the highways is our ever-increasing concern for the pollution of our environment. As cars become older, parts require replacement, repair, tuning, and continual preventive maintenance. Our experience has shown that as a vehicle increases in age its chances of becoming a contributor to pollution also increases if not properly maintained. An improperly functioning carburetor, distributor, spark plugs, leaky valves, faulty piston rings, all contribute to air pollution. Any one of these defects will increase the level of emission significantly. The public must be informed that it is necessary to maintain surveillance over his vehicle so that it may be detected before it becomes a polluter.

The further additions to highway safety program standard No. 1 have evoked our interest and lengthiest comment. You will probably find when all of the rhetoric and special pleading has been analyzed that the question of diagnostic centers, inspection stations, inspectors, however the individual or facility that evaluates a vehicle's condition is referred to, elicits the greatest controversy, especially since this bill would replace inspectors in certain States that now license them to be inspectors and the bill disallows the sale of parts and services on the same premises where the inspection or diagnosis is performed.

Presumably, there is, in the judgment of the authors of this bill, a danger of a conflict of interest where law enforcement and commerce share the same premises. This premise is essentially why we asked to appear here today. It seems to us that a great deal of criticism directed against repair work relates to work not being needed and selfishly recommended. Also many inspections are faced with this failure because of the promotion and sale of unneeded parts. On top of that, there will always be apprehension about the quality of inspections or diagnoses rendered not by impartial parties with a singular interest in inspecting for or diagnosing a car's faults, but by dually motivated businessmen. Any system that effectively creates a tempting climate, such as the present system does, has rather obvious pitfalls. Bear in mind that we do not intend these comments as a cynical appraisal of all inspectors. We mean only to suggest that under the present system the prevailing margin for private advantage at public expense is unacceptable for a national safety program.

Although many firms in the segment of the industry represented by our association presently perform inspections and also sell repairs and parts, we do not hesitate to recommend that all such businesses divest themselves of one or the other. If, however, a facility is equipped to inspect and diagnose thoroughly and rapidly, we would be perfectly willing, in most instances, to go on record in defense of the quality with which these services are performed as well as the impartiality maintained as respects where motorists get repairs and parts. Yet, we do not hesitate to recommend that all such facilities divest themselves from the repairing or parts-selling business. Or, if a facility is equipped to inspect or diagnose thoroughly and rapidly, we would recommend that it be allowed to charge realistically for its

function and expect, if that is the case, supplemental funds from the State that would assure reasonable charges and reasonable profits to compensate for the prohibition of selling parts and services.

We are extremely confident that the motorist will select wisely from among available service and parts outlets away from inspection stations or diagnostic centers. We will always be in the parts supply and repair automotive aftermarket industry and we fail to see any economic damage to our industry by allowing the public to choose its merchants rather than allowing merchants to capture the public.

We agree with Senator Hart when you envision an enormous cost savings to consumers upon passage of this bill. You are right when you say a nationwide system of diagnostic inspection systems may well prove to be the greatest money and frustration saver in the bill and that the diagnostic centers also would be used by the States for periodic inspections required under their laws. We have maintained all along that periodic inspections are the only practical means to assure that the vehicles on the road are, in themselves, safe for operation. We have also maintained that Federal standards for vehicles in use would validate public confidence in inspections by letting the public know what the inspection yardstick was, and by letting the public retain its option to get its cars in safe condition at competitive prices, or by doing his own repair work if he is qualified to do so.

Diagnostic techniques to analyze vehicles are increasing in popularity. They should be encouraged in such a way that all devices, techniques, and systems developed may be compatible with vehicles now on the road or developed in the future. We see the day when motor vehicles will have built-in diagnostic features which will allow for hookup to external diagnostic equipment. Such equipment should be so designed with uniform diagnostic principles and with a similar circuitry so that the independent inspector at a diagnostic station can test vehicles. Specific circuitry in a car with unique plugs should be discouraged, for this would reduce the freedom of choice of the consumer. He should have the right to competitive repairs of his car, if necessary, and should not have to go back to the original dealer to have his car tested and repaired. Therefore, we strongly urge the development of uniform diagnostic concepts to analyze and inspect motor vehicles.

In conclusion, we agree with the author that the consumers do want dependable automobiles—autos that are safe and economical to operate—and that do not pollute the air or the ground. We therefore strongly support the conception that diagnostic inspection centers as an independent entity, either operated by individuals or State government, in all instances these facilities will only offer diagnoses and inspection. They will not offer parts for sale or repair services. We further recommend that regular, mandatory vehicle inspection be embodied in this bill with uniformity of standards established by the Federal Government.

Thank you.

Senator HART. I am sorry, I was catching up with you and then you introduced a sentence just at the end which is not in the text. Would you reread that?

Mr. SCHLENGER. We further recommend that regular, mandatory vehicle inspections be embodied in this bill with uniformity of standards established by the Federal Government.

Senator HART. Thanks very much.

First of all, I welcome the support that you voice for features of the bill before us; and you, without putting dollar signs in here, say that inspections such as are required in the bill would be a benefit both from a safety standpoint and as an economic benefit.

Of course, I have been saying the same thing, but can you help me get more specific? If you can't maybe when you get back you will have an opportunity to provide it for the record. How close can you come to saying how much it would cost a vehicle owner to obtain the kind of inspection visualized here and how reliable—I suppose that would have to be in percentage—is the feedback, the verdict you get when you go through such an inspection?

Mr. SCHLENGER. I frankly feel that it could be kept at an approximately \$5 figure for a good safety inspection. As to the quality of the work, this is strictly depending on the—

Senator HART. I don't mean whatever quality of repairs which might be made, but the reliability of what you get for the \$5 judgment?

Mr. SCHLENGER. The quality of the inspection?

Senator HART. Yes.

Mr. SCHLENGER. You would have to have qualified inspectors that pass certain standards. This would be strictly up to the controls put into effect. It would vary as to how well it is supervised on controls. For example, in the State of New Jersey right now, our inspection there which is on a yearly basis is really one of the better ones in the country. I think it does a fairly good job.

Senator HART. I think it was today—although I could be wrong on that—that I noticed an analysis of some inspections that are being done in California which underscore the direct benefit to highway safety that can be obtained from inspections. The impression I have is that it is a study—I don't know whether the study investigated accidents that had accrued. Does this ring a bell with you? Have you seen it?

Mr. SCHLENGER. I think it was in the document of the gentleman who was on before me, in his presentation. I think it was in there. I think something like 29 percent was the figure I saw in there.

Senator HART. Let's assume it is 29 percent. That does give real meat to the argument that there is a very significant safety factor quite aside from the economic benefit of diagnostic inspection. I think you didn't say anything about the section of one of our bills that requires standards to be set for reparability and fragility and specifically the one known as the bumper standard.

Do you have any comment on that one?

Mr. SCHLENGER. I would be speaking on an individual basis because that would not be falling into our scope.

As an individual, I feel that this would be a great boon to the American motorist, I really do. Today you will see especially in the metropolitan areas we sell all accessories, but today one of the big items that we are selling is these large bumper guards. People are now putting them on because of the enormous cost on a minor front-end accident. I think it is excellent, though.

Senator HART. Mr. Schlenger, you are correct. The study that I was not able to lay a hand on was a California study and it was in-

cluded in the materials given us by Mr. Maisonnier. It was a study that was made by the California highway patrol, comparing more than 400 fatal single traffic accidents for mechanical failure. You are right, 29 percent of the examples examined had one or more mechanicals; more than 6 percent had a mechanical defect which caused the accident. This could produce an enormous chunk of fatal accidents.

Mr. Sutcliffe.

Mr. SUTCLIFFE. I find it very difficult to formulate questions on a statement that is very much in support of the particular legislation. Perhaps this is a weakness in my own ability to critically analyze.

One question does occur to me. You ask that in this legislation we mandate periodic motor vehicle inspections. Under the Highway Safety Act of 1966 there was a requirement that the Secretary of Transportation require the States to periodically once a year inspect motor vehicles. That standard has been in effect and to date it has not been complied with in many jurisdictions. The legislation even provided for a penalty against the contributions to the States to the highway trust fund. But that particular penalty has not been assessed so as to encourage the States to undertake periodic motor vehicle inspections. And if it were, many State officials have stated they would not undertake periodic motor vehicle inspections because the costs for them to undertake such a program would exceed the penalty that was set.

Are we talking about two different animals when we talk about the kind of periodic motor vehicle inspection that takes place in some States and diagnostic, dynamic testing that we envision utilizing in S. 976?

Mr. SCHLENGER. Well, as far as the periodic—I am talking about your yearly inspection, this is one animal. It is two separate things we are talking about. As far as I am concerned, they would both be performed by the same physical facility.

Mr. SUTCLIFFE. And that would be probably a little different facility than many of us have seen?

Mr. SCHLENGER. Right, that's correct. You would have two different entities. One would be the periodic safety test which would be performed by the same agent, and the other one would be the diagnostic which would be in the same facility. It would be two different and drastically different costs as far as my appraisal.

Mr. SUTCLIFFE. So your \$5 figure would be your required safety inspection required in S. 976 not only annually but after a crash or when title is transferred?

Mr. SCHLENGER. Right.

Mr. SUTCLIFFE. Your other inspection would be those inspections to determine how to maintain a vehicle in mechanical order so that its performance outside the safety area is optimum.

Mr. SCHLENGER. I have here both of these. I have one which would be your simple safety inspection, which would be what would happen——

Mr. SUTCLIFFE. What are those cards, what a person would receive from inspection?

Mr. SCHLENGER. This would be an idea of a card whereby on one side would be the identification of the vehicle and the safety items to be inspected, and it would show what was needed to bring the car into

a completely safe condition. The other side would have to be filled out by the repair facility, and it would indicate what the costs would be and then at the bottom of it—this is an idea that has been submitted—would be a certificate that this work was performed by the repair facility which would have to have an authorized individual signing it.

This would bring about the issuance of the permanent inspection sticker. In other words, when the car moved through inspection initially, the sticker is taken out. If the car goes through, if it is all right, a new sticker is put on. If it is not all right, a temporary sticker is put on. The faults are entered, and then the individual has it fixed at a repair facility. After it is fixed, it is certified that it is taken care of by a certified inspector at the repair facility. Then he in turn will send this back, either by mail and get a sticker, or if necessary he would have to bring the car back into the inspection station. This is one thought of how this system would work.

Now, on the other hand, I also have here what would be considered a diagnostic form. This has 150 different check points. This is a complete diagnostic system.

Mr. SUTCLIFFE. This would be an optional fallout advantage for the diagnostic center established by the Government for safety purposes?

Mr. SCHLENGER. That's right. This would be the kind of thing you would run your car through, find out what was wrong, take it to a mechanic, have a mechanic know what was wrong with the car, fix those things, and you could then, if you wanted to, run it back through the diagnostic center to make sure the car had been properly repaired.

Mr. SUTCLIFFE. May we have, for the record, those documents? Do you have copies?

Mr. SCHLENGER. Surely, both of them, yes.

Senator HART. Thank you. They will be made a part of the record.

## SLIDES TO BE PRESENTED

MEASURED DECELERATION-DISPLACEMENT DATA FOR  
FRONTAL TESTS WITH 1970 CHEVROLETS

Senator HART. It makes it a little more understandable to those who are not familiar with even a raw sort of outline procedure to understand how this could be translated into a manageable and understandable form from the consumers' point of view. You would know what you were shopping around for if you wanted to shop around.

Mr. SCHLENGER. With that form there, you could do maybe three different repair facilities and check their prices.

Mr. SUTCLIFFE. Senator, I have no further questions.

Senator HART. Mr. Schlenger, nor do I, but I thank you very much for the support you voice for certain of the legislation and giving us the last two documents that were just made a part of the record. Others on the committee will be interested in seeing them.

We adjourn to resume in this room at 10 a.m.

(Whereupon, at 5:40 p.m., the hearing was adjourned to reconvene at 10 a.m., May 7, 1971.)

# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

FRIDAY, MAY 7, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met, pursuant to recess, at 10 a.m. in room 5110, New Senate Office Building, Hon. Philip A. Hart, presiding.

Present: Senators Hart, Baker, and Cook.

Senator HARR. The committee will be in order.

As I probably indicated yesterday, the highlight in a personal sense for me in this hearing is the opportunity to welcome our next witness. Politicians particularly overdo the business of describing people in extremely favorable fashion to the point where it is discounted 99 percent. In this instance I could use many complimentary adjectives, but shall not, and simply say that I welcome the man who was elected secretary of state in Michigan. He is certainly one of our finest public officials and a very good and old friend of mine, Secretary of State Richard Austin.

## STATEMENT OF HON. RICHARD H. AUSTIN, MICHIGAN SECRETARY OF STATE

Mr. AUSTIN. Thank you, Senator Hart, not only for inviting me, but for that very kind introduction.

Senator HART. May I introduce the Michigan secretary of state, Mr. Austin, Senator Cook.

Senator COOK. How do you do, Mr. Austin.

Mr. AUSTIN. Mr. Chairman and members of the committee, I am honored to appear before this distinguished body to discuss some of the problems of motor vehicle accident compensation. I would like today to talk about the Michigan experience and current moves toward reform in this area.

In the past few weeks several important bills have been introduced in the Michigan Legislature which would establish no-fault auto insurance. As secretary of state I have watched these developments carefully and am studying the individual proposals as they are developed. In Michigan the secretary of state, among other duties, administers the State's motor vehicle and driver licensing programs. We have on file some 5,900,000 driver records and approximately 6 million motor vehicle records in our files.

As a basic set of guidelines for the appraisal of new legislation I have found most valuable the Department of Transportation automobile and compensation study materials.

Michigan differs from most States in its approach to the general subject of accident compensation. In 1966 our State established the motor vehicle accident claims fund (often referred to as the uninsured motorists fund or MVACF.)

I think I could characterize my testimony today as simply reporting from a State in which we believe we have a reasonably successful uninsured motorist program. But despite the fact we have what may be regarded as a reasonably successful uninsured motorist program, we feel that reform is necessary.

This fund in Michigan was designed to protect citizens from loss due to death, injury, or property damage in excess of \$200 resulting from accidents involving drivers who did not have insurance and who were found to be at fault, or unidentified drivers.

Michigan law requires every operator of a motor vehicle to have a minimum amount of property damage and public liability insurance. Those who do not present proof of this insurance must pay a \$35 fine or penalty to the State's MVACF. In addition, those who have the minimum insurance pay an annual fee of \$1 to the fund. I think it is important to report that actions of the current session of the legislature have increased the uninsured motorist fine to \$45, it was increased \$10, and at the same time the legislature eliminated the fee of \$1 on the insured motorist. We have been analyzing the financial condition of our fund and some of us felt perhaps we could eliminate the \$1 charge on the insured motorist and still maintain the fund solvent.

The legislature, however, felt that just to play it safe they would increase the penalty on the uninsured motorist \$10. If you are interested in how much money is involved, we are collecting approximately \$4 million from insured motorists at \$1 a piece, and we have been collecting approximately \$2.5 million, I believe it is \$2.5 million, from the uninsured motorists. We are going to lose some of our revenue in this process, but by increasing the uninsured motorists \$10 we will make up part of the loss. I am informed that the actual amount we collect from the uninsured motorists is about \$8 million.

Since its inception in 1966 the fund has succeeded in satisfying certain claims and providing some of the protection it was designed to achieve. I do not, however, regard this as the best solution available in the light of other current alternatives.

In its first 5 years of operation the Michigan fund has collected a total of nearly \$68 million. Nearly \$11 million has been paid in claims. However, a little more than \$11 million has been expended for legal, administrative and other operating needs. Note this, please: of every average dollar paid by the fund 49½ cents went for claims while 50½ cents went for operating expenses. Moreover, as the fund matures and claims accumulate, legal costs are skyrocketing proportionately from \$380,000 2 years ago to \$500,000 last year to an estimated \$775,000 this year.

We had a unique problem with the fund this year. No sooner was I elected to my present office than the Governor, hard pressed by serious fiscal problems, proposed that the State borrow a considerable part of the MVACF to be used by other State departments. A loan of \$45 million has just been negotiated for this purpose by the legislature.

A danger heretofore underestimated is that sometime in the future lurks the possibility that money assigned to the specific purposes of

accident compensation may not be available for the job intended. I devoutly hope and trust this will not occur, but you gentlemen are well aware of the alluring temptations posed by a voluptuous surplus or contingency fund anywhere during a time of fiscal crisis.

Senator Cook. Mr. Austin, before you go on, may I ask what kind of loan it is? I mean what type of payback provisions does it have?

Mr. AUSTIN. It is to be paid back at the rate of \$9 million a year over a 5-year period, plus interest. We had quite a controversy over the interest question.

Senator Cook. Does it have a provision requiring that at no time will the State, in regard to that note, allow the fund to become insolvent?

Mr. AUSTIN. Exactly. The legislature in the bill which authorized the transfer provided for meeting any claims that might arise in the fund that we are unable to meet as a result of this money being borrowed from it.

Senator Cook. So it is conceivable that the state, out of necessity and by legislative action, would have to accelerate its payment so your fund would not become insolvent?

Mr. AUSTIN. Right.

Senator Cook. Thank you.

Mr. AUSTIN. You are quite welcome.

I would like to explain my other reservations about the motor vehicle accident claims fund as it operates in Michigan.

First, insurance companies are now able to refuse coverage to drivers they consider bad risks (for whatever reason) and thereby force them to do one of two things. They may either make application to the so-called assigned risk pool operated by the insurance companies and be assigned to an insurance company which must write them a policy, although the rates are quite high; or they must pay the \$35 fee, now \$45, to the fund if they want to drive legally. Last year 83,000 motorists applied to the assigned risk pool for coverage while some 260,000 motorists elected to pay the fund. Incidentally, we are not prepared to tell you whether the 260,000 represents all of the uninsured motorists, because many drivers who buy insurance very often drop their insurance after they get their license. And I should also make clear that the fund is not insurance.

Too often the decisions by insurance companies not to insure motorists are based not on true risk or on driver ability but on place of residence, age, or other discriminatory rulings which are not applied equally to all drivers but act particularly against black people and poor people.

Second, if an uninsured motorist is involved in, but not responsible for, an accident, he is often forced to agree to pay at least a portion of the damages in order to retain his license and avoid having to buy expensive financial responsibility insurance. And I will say more about this financial responsibility insurance.

In Michigan an uninsured motorist involved in, but not necessarily responsible for, an accident resulting in death, injury, or property damage in excess of \$200 has 60 days to either: (1) Submit an affidavit attesting that all claims arising from the accident have been paid, or (2) deposit an amount with the State equivalent to the estimated dam-

ages which will be held for at least 1 year. If neither of these steps is taken, his license will be suspended.

To regain his license he must comply with one of the two previously mentioned requirements, and in addition must purchase what is called financial responsibility insurance, and maintain this coverage for 3 years.

The cost of the financial responsibility insurance is not based on the same rate structure that governs regular insurance policies. It is not unusual to find such policies costing up to \$1,500 per year or more. The only other option open to an individual who must prove financial responsibility to drive legally again is to deposit \$25,000 cash or an equivalent bond with the State for 3 years. And no one remembers that ever happening.

Keep in mind that this is what can happen to an uninsured motorist if he is involved in one of these accidents even though he is not responsible for the accident.

The shortcomings of our MVACF can be overcome, in my opinion, with a complete compulsory and effective no-fault auto insurance plan.

This no-fault legislation should, in my opinion, cover both personal injury and property damage, although plans have been proposed that would make the property damage or collision optional. It should pay the entire loss suffered for injuries resulting from an auto accident, except for compensation occurring from other sources, such as sick pay or health insurance. I would hope that standard coverage would amount to at least \$1,000 per month for wage loss and at least \$1,000 for funeral expenses. The insurer would, of course, make available to the policyholders as options larger benefits as well as certain deductibles.

I do not favor no-fault legislation which offers less than a complete overhaul of our present system. A prescription for vitamin pills will not suffice where massive blood transfusions are required, and I think you will agree that that is what is required in this industry.

A proper, comprehensive, consumer-oriented no-fault law would not only contribute to solving today's crisis in auto insurance but would in Michigan also eliminate the need for our motor vehicle accident fund. If it does not eliminate the fund, it would at least reduce reliance on the fund. And I do not want it to be understood that my presence here today is to advocate abolishing this fund. What I am simply saying is that if we can get a comprehensive no-fault plan we may be able to eliminate the fund and have better coverage for everyone.

There would be other advantages to a good no-fault program. You are familiar with most of them, so I will not be repetitious. Let me, however, mention one or two of the advantages that I regard as vital.

Insurance companies under no-fault as I understand it would no longer be able to refuse coverage, but instead would establish a rate structure based upon driving performance. This would have the added strong incentive for each motorist to improve his driving record to obtain a better rate.

The tragic continuance and increase of fatalities and injuries on our streets and highways requires strong governmental responses.

Incidentally, on Easter Sunday in the city of Detroit we had a single accident in which seven people were killed, including the driver.

We must judge every new program first by what it will do to reduce

the horrible carnage resulting from auto accidents. That is why I prefer an insurance program which recognizes and rewards good driving performance.

Another principal advantage of no-fault would be the elimination of the need for financial responsibility insurance. If all drivers are required to have some form of low cost minimum coverage, this extra insurance should be unnecessary.

The legislation which I favor has been recently introduced by State Senator Coleman A. Young and is now before the Michigan Senate. I think I should make clear that Senator Young's bills have just been introduced; they have not yet been subjected to the close scrutiny that bills are normally given in our legislature; there have been no public hearings and the bills do not mesh together perfectly, but they do embrace the general concept that I favor. And I feel that the legislature will, before it has completed its deliberations, perfect these bills.

Let me add, however, that I would strongly urge this committee to recommend a national no-fault program rather than allow 50 varied and unsynchronized plans to be developed unevenly, unrhythmically and possibly dischordantly. This insurance symphony should play one set of music requiring all members of the orchestra to play under one director.

We in Michigan have no alternative at the present moment but to proceed with our own State plan. I would prefer, however, to see a national no-fault bill along the lines of the one proposed by our own senior Senator, Philip Hart. This bill in my opinion should be strengthened by including coverage for property damage—I feel very strongly about property damage—to fulfill all of the "Recommendations for Change" as advanced by Secretary of Transportation John A. Volpe.

If Senator Hart's bill is adopted we in Michigan would be able to assure our motorists the same protection wherever they go, in whatever State they visit and at a time of personal crisis when this assurance would be of special comfort. I would like to be able to tell Michigan residents they will have the same protection in any State they visit.

We in Michigan have good insurance laws, fair programs, a reasonably effective anticancellation act, group auto insurance plans and an uninsured motorists fund which, despite its shortcomings, provides needed protection. We are also taking important steps to work toward enactment of the most complete consumes no-fault auto insurance program in the country.

The Department of Transportation and this committee have provided us with valuable assistance. On behalf of our State, I want to thank you for this help and I want to express my deep appreciation for allowing me this appearance today.

Thank you.

Senator HART. Mr. Austin, thank you. I should indicate that as you were testifying we were joined by the able Senator from Tennessee, Mr. Baker.

Mr. Austin, as a citizen of Michigan, I would make this one comment. I think we can describe Michigan as a good State as far as uninsured motorists, and yet having said it that way, we realize how unsatisfactory the average is. In Michigan, as I gather from your testimony, the number of drivers operating without liability insurance runs

between 5 and 10 percent. Nationally the average is about 15 to 20 percent.

I am struck by one point you make here and——

Mr. AUSTIN. May I interrupt?

Senator HART. Yes.

Mr. AUSTIN. It is quite possible the number of uninsured motorists could be higher in Michigan. We know how many are paying the penalty, but there are more, perhaps, who are not insured. They may be able to provide proof of insurance at the time they renew their license, but that insurance could lapse, and more of them may be driving without insurance. I wanted to make sure on that point.

Senator HART. Maybe that is why I threw in the 5 to 10 percent.

One point you make is that you want an insurance program which recognizes and rewards good driving performance. One of the criticisms against a no-fault system is that good, bad, and indifferent, there is no reward for disciplining yourself to be a safe driver. You don't have to worry about the cancellation or failure to recoup your losses because of your own negligence. Have you given thought to this aspect of the debate?

Mr. AUSTIN. Yes, Senator. In Michigan we are very fortunate in having a very sophisticated computer system and a point system for rating drivers. We have approximately 5,900,000 driver records on line on our computer for immediate access.

Senator HART. Does that mean we have listed 5,900,000 people?

Mr. AUSTIN. That is correct.

Senator HART. As drivers?

Mr. AUSTIN. As drivers.

It is possible from a terminal anywhere in the State to communicate directly with our computer and within 30 seconds to a minute get a copy of any driver record, any one of those 5,900,000 records.

I want to qualify this: Sometimes it takes 2 or 3 minutes to print out one of those records, but the record can be searched out in about 30 seconds to a minute.

We have a point system which requires us to review a driver's record when he accumulates 12 points, and at that point we can suspend his license, or we can put him into some type of driver improvement program. If he responds, his license may not be suspended.

Well, with the facility that we have available, it would not be difficult to provide insurance companies with some accurate information that could be used for setting rates, variable rates, depending on the driver's performance. So even under a no-fault program, it would be possible for the insurance companies to vary the rates depending on a person's driving skill and ability and performance.

I feel that even under a no-fault plan there would be an incentive to drive carefully, avoid accidents, in order to keep the premium low.

Senator HART. Thank you.

There is one second criticism that you might have some reaction to. There is developing—I think I state this fairly—there is developing an agreement that we should go to a no-fault system in this country. But the suggestion is made that we experiment at the State level. If, in the next few years, there is a no-fault system as a result of the action of the 50 State legislatures, then we will have moved to national no-

fault. And if there is not, and the Federal Government decides to apply no-fault through Federal legislation, we will have had the benefit of a series of experiments at the State level.

That assumes that half a dozen or more States will adopt a form of no-fault insurance. You have reminded me that State Senator Coleman Young has introduced legislation in Michigan. This is true elsewhere. How does that argument strike you, that we ought to wait and see what the States do and what we learn from what they have done?

Mr. AUSTIN. I don't believe we should wait for national guidelines, if I can use that expression, national direction. I am personally afraid to have 50 States experimenting. We have no choice if the Federal Government does not move, if Congress does not move. Because we have got to reform our insurance programs.

But it would seem to me that it would be much better if we could have a synchronized program in effect throughout the Nation, as many drivers cross State lines, and I have a feeling that unless the laws are uniform in the States, at least in some very basic respects, drivers will not know exactly what their responsibilities are in the States in which they are driving, except the State of their residence.

I feel also that some of the States may fall into some practices that will be hard to correct, once the Federal Government acts and decides on guidelines for all of the States to observe. Since we are plowing fertile ground, it just seems to me it would be so much better if we could get the resources focused on this problem, to come up with a solution that is best for all of the people of the country and then all of us can proceed harmoniously to work within those guidelines.

So I do not favor waiting. I believe we ought to move immediately with Federal legislation.

Senator HART. Thank you very much.

Senator Cook?

Senator COOK. Mr. Austin, you reveal some very interesting statistics. I notice in one item later on you state that the fund is not insurance. Yet, your record of payouts per dollar paid in is about equal to the insurance companies.

You state that you have paid out 49½ cents for claims, and you have paid 50½ cents for operating expenses. What do you include in operating expenses? First of all, before we get to this, so I think we can both have some background, will you explain to me under what terms you make a claim with the fund, what the fund stands ready to pay in relation to the \$35 or the \$45 that is paid in? Could you give me an idea of some of the judgments that have been rendered against the fund, as to their size, and then let's talk about the expenses.

Mr. AUSTIN. First of all there are limits. It is the \$10,000 and \$20,000 limits.

Senator COOK. All right. That is your limit then.

Mr. AUSTIN. There is also a \$200 deductible, that is the minimum. That is for property damage. There is no minimum for personal injury, just for property damage.

Senator COOK. It is 10-20, and the ceiling.

Mr. AUSTIN. That is correct. The legislature, incidentally, this year has raised those limits to \$20,000 and \$40,000, but we have had no experience with 20 and 40. In fact, the Governor has not yet signed the bill.

Senator COOK. Can you give me an idea of some of the judgments on personal injuries that have been rendered against the fund?

Mr. AUSTIN. You mean aside from the maximum? We have had several maximums.

Senator COOK. I am talking about personal injuries. You said there was no ceiling on personal injuries.

Mr. AUSTIN. I am sorry. There is no deductible on personal injuries.

Senator COOK. I see. All right.

Mr. AUSTIN. The ceiling is 10 and 20.

Senator COOK. Now, did the fund pay out \$380,000 2 years ago and a half a million dollars last year to lawyers that defended the fund?

Mr. AUSTIN. Yes. This was paid to—we have a special arrangement with the Attorney General who appoints attorneys across the State to represent the fund in the various counties and communities. And these are the fees that we paid to our own counsel. It does not include fees paid by motorists who may have engaged counsel to collect money from the fund.

Senator COOK. What I am trying to suggest is that this really doesn't constitute an insured fund. If you feel it is the responsibility of the State to defend these claims, if you feel it is the responsibility of the State to try these claims, if you feel that it is the responsibility of the State to pay out of this a half million dollars a year for legal counsel to defend these claims, then it really does constitute a degree of insurability, does it not?

Mr. AUSTIN. I suppose you could construe it as a degree of insurability, except that every claim that is paid is collectible, or at least is presumed collectible. We have had very poor experience in making collections. Every claim that we pay must be repaid.

Senator COOK. I think it is very interesting in all of this that a fund to protect against the uninsured motorist on the State level, on the governmental level, has cost so much to administer as compared with what the insurance companies are paying out per premium dollar.

In other words, you are paying out 49½ cents and it is estimated that the insurance companies throughout the country are paying out somewhere around 50 cents out of every premium dollar.

Mr. AUSTIN. You understand that this is because fault must be determined, that is, the responsibility for the accident must be fixed and then the amount of the claim must be established.

Senator COOK. You treat it on a straight tort liability basis then?

Mr. AUSTIN. Exactly.

Senator HART. It is a small wonder there isn't any variation.

Senator COOK. I am not arguing the point.

Senator HART. No. I understand you are not arguing the point, Senator Cook.

Senator COOK. Apparently counsel has done a pretty good job for the fund, because it has paid out \$11 million and collected \$68 million.

Mr. AUSTIN. I think maybe I better do a little explaining here, too.

Senator COOK. All right.

Mr. AUSTIN. The cash that was in the fund was encumbered by claims that are in process of litigation.

Senator COOK. Then it is treated the same as insurance.

Mr. AUSTIN. We have approximately \$30 million of claims that are now in the process of litigation. Of course one of the big argu-

ments that I had when the State insisted upon borrowing \$45 million was that the money was encumbered. But it was borrowed anyhow because it was needed to mete out State responsibilities.

Senator COOK. You are also collecting approximately \$14 million, adding to it every year, and some of the \$30 million encumbrance is more than a year old, I assume; is it not?

Mr. AUSTIN. Exactly.

Senator COOK. In other words the encumbrance of your fund, and I direct this to both of you, the encumbrance of your fund is really in direct proportion to the ability to try?

Mr. AUSTIN. Exactly.

Senator COOK. In other words, if you have \$30 million encumbered, some of the claims may be as old as the fund itself if you haven't been able to get trial on a particular case. Would that be correct?

Mr. AUSTIN. Exactly. There are unpaid claims and there are also claims pending and the insurance commissioners, the actuaries who examine our funds, established the full liability at approximately \$30 million.

Senator COOK. What do you do when a claim is filed? Do you immediately assign that claim a value based on an investigation, and immediately encumber the fund to that extent?

Mr. AUSTIN. Exactly.

Senator COOK. And it constitutes an encumbrance?

Mr. AUSTIN. That's right.

Senator COOK. Now, as you foresee it in your own mind, in what you would like to have, with the elimination of State authorized programs, State authorized no-faults, give me your opinion of section 3(b) of S. 945. It reads as follows:

No State shall require the purchase or acquisition of insurance or any other security as a condition to the operation or use of any motor vehicle upon the public streets, roads, or highways of such State, other than the insurance required under section 5 of this act.

Do you believe that a Federal bill should provide or at least give the signal to the driving public that it need only carry whatever is authorized under a no-fault program and not attempt to secure other coverage?

Mr. AUSTIN. Oh, I would not in anyway suggest that a person should not be encouraged to get coverage additional to that which may be provided in the bill. As I understand it, your Senate bill does not provide for property damage. Am I correct?

Senator COOK. That is right.

Mr. AUSTIN. Obviously an individual should carry property damage insurance.

Senator COOK. Then you think that a State ought to have the authority legislatively to protect its own citizens over and above a Federal statute if it feels it is for the benefit and safety and protection of its citizens?

Mr. AUSTIN. Oh, I would agree. I would agree.

Senator COOK. Thank you, Mr. Chairman.

Senator HART. I take it that when you describe our fund as not insurance, you have in mind this distinction, that the State has to then go out and act against, attempt to recover or collect from the uninsured motorist—

Mr. AUSTIN. Let me express it another way, Senator, if I may. The \$35 that an individual pays is not an insurance premium. That is a penalty that he pays for not having insurance coverage at the time he applies for his automobile license. Other individuals who are insured are required or have been required up to this point to pay \$1 into the fund, and they may derive absolutely no benefit from it.

Senator Cook. But, Mr. Austin, let me ask you this:

You said last year 83,000 motorists applied to the assigned risk pool and 260,000 motorists elected to pay to the fund. In other words, they don't really have to place their name in the assigned risk pool if they elect to pay the \$35 since they are protected under the fund.

Mr. AUSTIN. They are not protected. It is the unsuspecting driver who happens to be injured or damaged by one of them that is protected.

Senator Cook. That may be true, but they are receiving the benefits of 10 and 20, are they not, by reason of paying the \$35 and now \$45?

Mr. AUSTIN. I would rather put it this way, if I may——

Senator Cook. Well, the fund might be able to collect from them but——

Mr. AUSTIN. An individual who is injured by one of these drivers will be able to collect the 10 and 20, but the uninsured motorist is not absolved of the responsibility to pay the 10 and 20.

Senator Cook. No, but you can have a lot of bankruptcies when you decide to try to collect it.

Mr. AUSTIN. So it is not insurance in that respect. Normally if you have liability insurance and pay your premium, the insurance company meets the claim and that is the end of it.

Senator Cook. Well, if somebody collects, \$20,000 from a man who has nothing but an automobile there is not really much of a chance of the fund ever collecting the \$20,000?

Mr. AUSTIN. Our experience has been a collection of somewhere between 10 and 12 percent of the claims we have paid out.

Senator Cook. All right. That kind of substantiates what we are talking about.

Mr. AUSTIN. Yes.

Senator Cook. What you really find in the range of 10 to 12 percent would be those drivers who probably have been denied coverage by reason of previous accidents, have not been given insurance in the assigned risk pool when it comes time for them to be licensed——

Mr. AUSTIN. Or they may have an alcohol problem.

Senator Cook. Yes. They wind up paying the \$35 or \$45, because they cannot get insured any place else, and happen to have assets. But you wouldn't suggest that you will be able to recover from most of the 260,000 motorists that elected to pay into the fund. You said you might be 10 to 12 percent successful in recovering directly from them?

Mr. AUSTIN. That's right.

Senator Cook. Thank you.

Senator HART. Senator Baker.

Senator BAKER. Mr. Chairman, thank you very much.

Let me instead of asking questions, which I would like to do, apologize to you for having been absent from these hearings from the necessity of having to chair hearings on S. 1113 for the last 6 days. I am very sorry to have missed this testimony. I will read it very carefully. S. 1113 is a piece of legislation to create national environ-

mental laboratories, so I feel it necessary to be present at those hearings.

Now I apologize to the witness for being late today, but assure him I intend to explore the points he makes very cogently in his statement and to try to make a further contribution to these hearings as you progress further.

I thank you for the opportunity and respectfully decline under those circumstances at this time.

Senator HART. Mr. Austin, in view of the exchanges we have had, is there anything you would like to add that you think might be helpful.

Mr. AUSTIN. One thing I would like to do is to leave you a few copies of our Motor Vehicle Claims Act and also some of the literature that we distribute in connection with the fund, in which we try to explain to the motorists that by paying the \$35 you are not acquiring insurance. You may be getting yourself into a lot of trouble. And also explaining why we ask the insured motorists contribute \$1 to the fund. I feel that unless you have more questions to ask that perhaps I should not take more of your time, except to thank you for giving me the opportunity.

I have only been in my office now 4 months, and there is a great deal more about this that I want to learn and I wish that I knew before sitting here. However, I think that perhaps the information that I have acquired has been useful. We believe very strongly that we need to revise our insurance program. And I have support of some 2,400 employees in the Department of State who have had experience with our insurance program in Michigan over a period of years; I have support of many other citizens in our State who believe that we need to revise this program. So I would like to end my comments by urging you to proceed with some national legislation.

Senator HART. Thank you very much for closing on that note.

May I depart from the witness list as scheduled with this explanation, and I apologize to my colleagues on the committee. I have not had an opportunity to discuss this with them.

Late last night, but not received by the staff until this morning, a telegram was received from Richard Markus, president of the American Trial Lawyers Association, asking for any opportunity to respond to the testimony of yesterday. While I am sure my colleagues would not want to establish as a precedent the claim of personal privilege, nonetheless I think under the circumstances we would want to give Mr. Markus this opportunity to testify.

**STATEMENT OF RICHARD M. MARKUS, PRESIDENT, AMERICAN TRIAL LAWYERS ASSOCIATION; ACCOMPANIED BY JERRY FINN, OF NEW JERSEY, CHAIRMAN, LEGISLATIVE SECTION**

Mr. MARKUS. Thank you very much, Senator Hart.

With the permission of the committee, I would like to offer a prepared statement which I have submitted to the committee, and be given an opportunity to paraphrase that statement, so I may express myself more adequately.

Senator HART. If there is no objection, we will have the statement printed in full and you may proceed.

Mr. MARKUS. May I also indicate I have brought with me Mr. Jerry Finn of New Jersey, who is the elected chairman of the legislative section of the American Trial Lawyers Association and the purpose of his presence, like my own, will be to answer any questions the committee may have.

Mr. Chairman, as you kindly pointed out, I did send a telegram to this committee requesting an opportunity to appear here, after I had learned that Robert Joost had testified before the committee as to certain activities of the American Trial Lawyers Association.

The committee has most graciously given me an opportunity to appear at this time.

I would like to begin by saying I am personally proud of the efforts of lawyers and lawyer associations who become involved in America's political process. For too long, the legislatures have been dominated—even controlled—by insurance interests and other special interest groups. Within the immediate past, lawyer groups have taken a more aggressive interest in expressing themselves politically by contacting legislative bodies. Where they believed that particular candidates stood for principles of good government, they have exercised their privilege—and their duty—to contribute their nondeductible after tax money to support the campaigns of such candidates. I believe our system of government could not function otherwise.

I only regret that the efforts of lawyers and lawyer groups have typically been politically too little and too late. Manufacturers, commercial trade associations, insurers, and unions are just a few special interest groups that expend far more time and money toward their own political goals. Lawyers—the kind that belong to the American Trial Lawyers Association—have usually been slow or unwilling to put themselves actively into the process that forms legislation.

Frankly, while they also represent a special interest group, I consider that their interests are usually closest to the interests of the general public. Our members are the consumer protection lawyers in the consumer protection cases, the civil rights counsel in the civil rights cases, the antipollution lawyers in environmental law cases. In auto injury cases, we are the lawyers for innocent victims—the maimed, widowed, and orphaned. We believe that we are the people's advocates.

The committee chose to inquire as to political activity by our members and our association. We suggest that the committee might wish to explore the unquestionably greater political pressures exerted by much larger and far stronger commercial interests. If our political power is that great, one might reasonably ask why public spirited legislation which we have consistently supported has made little progress in many legislative bodies.

In the automobile area, why haven't we succeeded in causing repeal of a single host-guest statute, which has been one of our principal goals in the last decade or more. Why do most States resist our call for replacement of contributory negligence with comparative negligence rules? Why do legislatures reject our demands to end governmental immunity, family immunity, and charitable immunity? Virtually every scholarly commentator agrees that our position on these issues is in the public interests. But, powerful commercial insurance interests have blocked this public legislation. Is it any wonder

that lawyers are finally waking up to their public duty to make some impact on government? For too long they have simply tried to apply and implement laws—including bad laws. Finally, they are trying to help make good laws—laws that are good for the public. I only hope that they can amass enough strength to help the public.

It was regrettable that Robert Joost was the medium through which this committee obtained information about our modest political activities, not because I would criticize him, but only because I would hope you would ask me, since I am in more complete control of information.

I personally testified before this committee on the previous day as the president of the American Trial Lawyers Association. I am pleased to answer any questions about those activities now. In fairness, however, I suggest that the committee may want to recall earlier witnesses—and particularly insurance industry witnesses to ask them how many men and how much money they have spent to promote no-fault schemes in the various States. We know of \$100,000 full-page ad campaigns by insurance interests in both Massachusetts and New Jersey. We estimate that insurers have spent at least \$10 million to convince the American public and State legislatures that no-fault programs designed for the insurers profit have public merit.

This committee has been kind enough to permit us to express our views on the merits of the present legislation. We hope that State legislatures give us a similar opportunity to express our views on the merits of related legislation. Actually, we should all be searching for legislation that best serves the public. We believe, from opinion polls cited by us in our earlier testimony and from our own experience in representing injured victims, that we are speaking in the public interest.

I can only supplement that prepared material with two or three brief comments.

First, reference was made by the testimony of Mr. Joost to a handbook, or I have forgotten the word he used to describe it, a book describing the key men meetings. We are rather proud of those key men meetings. This is an effort to give information to our members and other interested persons about legislative proposals that we think have a public impact. And I have with me the handbook that was referred to by Mr. Joost, which lists the legislation that is concerned.

First, advance payments by insurance carriers—skipping down through some of them—comparative negligence, discovery statutes and rulings, governmental immunity abolition, interest running on judgments, judges and judicial administration statutes, jury statutes, providing for nonunanimous civil verdicts, jury statutes implementing and improving jury selection, minimum insurance limit coverage, consumer protection legislation, environmental law protection, discrimination in housing and public accommodations, inadequate housing laws.

These are just some of the rules which we have been trying to promulgate in State legislatures in recent times. I repeat again that we are proud of these efforts and we do not apologize to anyone for them. We wish we could be more effective.

Now if the committee has any questions about any of the activities of our association, I would be most pleased, and Mr. Finn, the legislative section chairman, to the extent that I do not have the information, would be most pleased to supplement anything the committee is interested in.

Senator HART. Thanks, Mr. Markus.

The testimony yesterday from Mr. Joost was a strong criticism of the activities of the American Trial Lawyers Association with respect to no-fault legislation and he, I think, detailed the factors which persuaded him to speak as he did. But I saw it more as an analysis of the need for no-fault than an analysis of the failures of the American Trial Lawyers Association.

Mr. MARKUS. May I say, Mr. Chairman, so there will be no question about this: We are opposed to bad bills in State legislatures, we are opposed to bad bills in the United States Congress. We are in favor of good bills in State legislatures, we are in favor of good bills in the United States Congress.

I might add that in this context that leading trial lawyers in Illinois have supported a no-fault bill, that the official affiliates of this organization, the Colorado Trial Lawyers Association, has supported a no-fault bill in Colorado. We do not take a blanket position on anything. We believe it is necessary to look at legislation carefully, not to look at labels, not to look at general descriptions, but to examine specifically particular parts of legislation.

I noticed in reviewing very briefly Mr. Joost's testimony that he was highly critical of Governor Ogilvie's bill in Illinois, he was highly critical of the Massachusetts law, as we have been. He finds that there are some portions of the Senate bill 945 which are favorable. We also suggested that we found some portions of it favorable. We may disagree with him, we may disagree with Senator Hart or with anyone else, and I think we respect their right to differ with us, and I hope they respect our right to differ with them.

We are all looking for a common answer and we hope it is found in the public interest.

Senator HART. In pursuit of that common objective, let us have for the file a copy of the Colorado bill.

Mr. MARKUS. I do not have it with me.

Senator HART. I understand that.

And let us have the bill that the Illinois association supports.

Mr. MARKUS. I do not believe it is supported by any association. But I said leading trial lawyers have supported that legislation.

Senator HART. Without labeling it, let us have a copy of what it is.

Mr. MARKUS. Surely, we will be happy to provide it.

(The information follows:)

(LDO No. 71 1450/1—House Bill No. 1483—Business Affairs—Engrossed)

FIRST REGULAR SESSION, FORTY-EIGHTH GENERAL ASSEMBLY, STATE OF COLORADO

(By Representatives Gustafson, Strang, Horst, and Lamn)

A BILL for an act concerning motor vehicle insurance

*Be it enacted by the General Assembly of the State of Colorado:*

SECTION 1. Chapter 18, Colorado Revised Statutes 1963, as amended, is amended BY THE ADDITION OF A NEW ARTICLE to read:

#### Article 25

##### MOTOR VEHICLE INSURANCE

13-25-1. *Short title.* This article shall be known and may be cited as the "Motor Vehicle Insurance Act".

13-25-2. *Legislative declaration.* The general assembly hereby declares that its purpose in enacting this article is to avoid inadequate compensation to victims

of automobile accidents and to require registrants of motor vehicles in this state to procure insurance covering legal liability arising out of ownership or use of such vehicles, and also providing benefits to persons occupying such vehicles, and to persons injured in incidents involving such vehicles.

**13-25-3. Definitions.** (1) As used in this article, unless the context otherwise requires:

(2) "Commissioner" means the commissioner of insurance.

(3) "Complying policy" means a policy of insurance approved by the commissioner of insurance and providing the coverages and subject to the terms and conditions required by this article.

(4) "Department" means the department of revenue acting directly or through its duly authorized officers and agents.

(5) "Director" means the executive director of the department of revenue.

(6) "Insured" means the named insured and relatives of the named insured who reside in the same household as the named insured.

(7) (a) "Motor vehicle" means:

(b) A private passenger automobile, including a sedan, station wagon, or Jeep-type automobile not used as a public livery conveyance for passengers;

(c) A utility automobile, including a pickup, sedan, delivery, or panel truck;

(d) A truck, including a tractor-trailer rig; and

(e) A self-propelled motor home.

(8) "Operator" means every person who is in actual physical control of a motor vehicle upon a highway.

(9) "Owner" means a person who holds the legal title of the vehicle; or in the event a vehicle is the subject of an agreement for the conditional sale or lease thereof with the right of purchase upon performance of the conditions stated in the agreement and with an immediate right of possession vested in the conditional vendee or lessee, or in the event a mortgagor of a vehicle is entitled to possession, then such conditional vendee or lessee or mortgagor shall be deemed the owner for the purpose of this vehicle.

(10) "Person" means every natural person, firm, partnership, association, or corporation.

**13-25-4. Administrative authority.** Except where specific administrative authority is conferred on the commissioner of insurance, the executive director of the department of revenue shall administer and enforce the provisions of this article, and may make rules and regulations in writing necessary for the administration of this article.

**13-25-5. Registration of vehicles.** (1) The director shall not register any motor vehicle unless and until the owner of such vehicle shall produce a certificate of self-insurance, or a certificate of insurance, on a form provided by the department, indicating he has insurance on such vehicle as provided by this article. Only policies validly issued by companies authorized to write in this state all the kinds of insurance embodied in the required coverages shall satisfy the requirements of this article.

**13-25-6. Minimum coverages required.** (1) (a) Subject to the limitations and exclusions authorized by this article, the minimum coverages required for compliance with this article are as follows:

(b) Indemnity for legal liability for bodily injury or death arising out of the use of the motor vehicle to a limit, exclusive of interest and costs, of fifteen thousand dollars to any one person, thirty thousand dollars to all persons, and five thousand dollars for property damage in any one accident;

(c) Compensation to injured persons for reasonable and necessary expenses for medical, hospital, dental, surgical, ambulance, and prosthetic services, Christian Science care and treatment, loss of earnings, and extra expense for personal services not connected with his business or occupation which would have been performed by the injured person for himself or for members of his household, arising out of an accident involving the motor vehicle and incurred within *thirty-six* months of said accident, to limits of *fifteen* thousand dollars to any one person, and *thirty* thousand dollars to all persons, in any one accident.

**13-25-7. Direct benefits.** (1) The benefits described in section 13-25-6 (1) (c) shall be available to all persons occupying the described motor vehicle and all persons injured in accidents involving the described motor vehicle, except occupants of another motor vehicle.

(2) When a person injured is also an insured under a complying policy, his complying policy shall afford primary coverage for direct benefits under section 13-25-6 (1) (c), and the insurer under his policy shall respond in accordance with its terms and limitations. Any other complying policy under which such person shall be entitled to recover shall afford excess coverage, and, where more

than one such excess policy is involved, the excess coverage shall be prorated among the insurers on the excess policies.

**13-25-8. Elective reduction of benefits.** (1) At the election of the named insured, the benefits described in section 13-25-6 (1) (c) may be provided subject to deductibles, waiting periods, sublimits, percentage reductions, excess provisions, and similar reductions offered by insurers applicable to expenses incurred as a result of injury to the insured.

(2) To permit the insured to minimize, so far as is reasonably practical, duplication of benefits available through other insurance, contract rights, statutory benefits, and government benefit programs including but not limited to medicare and medicaid, the insurer selling coverage under this article shall determine whether the purchaser of coverage under this article desires to minimize duplication of such benefits. In the event the purchaser indicates a desire to minimize such duplication of benefits, it shall be the duty of the insurer to ascertain the other benefits available to the purchaser and to avoid duplication of such benefits by methods enumerated in subsection (1) of this section so far as such minimization of benefits is reasonably practical.

(3) The commissioner shall promulgate rules and regulations describing the various equivalent benefits which satisfy the requirements of subsection (2) of this section and providing for the ascertainment of desire to minimize duplicate benefits.

(4) Employers providing coverage under section 13-25-6 (1) (c) shall be permitted to elect deductibles, waiting periods, sublimits, percentage reductions, excess provisions, and similar reductions to avoid duplication of benefits provided by such employers to their employees through other insurance, including but not limited to accident and sickness insurance, workmen's compensation insurance, and contractual sick leave.

(5) Insurers issuing complying policies may not require reduction of benefits.

(6) Insurers issuing complying policies shall not be required to offer any particular form of reduction in benefits.

**13-25-9. Required coverages are minimum.** Nothing in this article shall be construed to prohibit the issuance of policies providing coverages more extensive than the minimum coverages required as a condition for registration, nor to require the segregation of such minimum coverages from other coverages in the same policy.

**13-25-10. Required provision.** Any complying policy shall contain a provision to the effect that, notwithstanding any of its other terms and conditions, the coverage afforded shall be at least as extensive as the minimum coverages required by this article.

**13-25-11. Conditions and exclusions.** (1) The coverage described in section 13-25-6 may be subject to the conditions and exclusions which are customary in the field of liability insurance and which are not inconsistent with the requirements of this article.

(2) (a) The coverage described in section 13-25-6 may also be subject to exclusions where the injured person:

(b) Causes injury to himself intentionally;

(c) Is operating a motor vehicle as a converter without a good faith belief that he is legally entitled to operate or use such vehicle;

(d) Is operating a motor vehicle while committing a felony.

**13-25-12. Subrogation.** (1) Insurers providing benefits described in section 13-25-6(1) (c) shall be subrogated to the rights of the person or persons for whom benefits are provided to the extent of benefits provided.

(2) Insurers seeking to recover pursuant to their subrogation rights under this section shall maintain any causes of action in the name of the insurer and not in the name of the insured.

(3) The subrogation claim of the insurer, whether based on the statutory subrogation right under this section or on contract, shall lie against parties alleged to be third-party tortfeasors and not against the person or persons for whom benefits are provided.

(4) Nothing hereunder shall be construed, however, to preclude an insurer providing benefits under section 13-25-6 (1) (c) from making a claim against the person or persons for whom benefits are provided in the event of fraud or material misrepresentation leading to the provision of benefits.

**13-25-13. No tort recovery for direct benefits.** (1) Any person eligible for benefits described in section 13-25-6 (1) (c) is precluded from pleading or introducing as evidence in an action for damages against a tort-feasor the amount of

benefits which would be recoverable under the coverages described in section 13-25-6 (1) (c), without regard to any elective reductions in such coverage, under section 13-25-8, whether or not such benefits are actually recovered.

(2) The limitation on tort recovery provided in subsection (1) of this section is confined to benefits required to be provided under section 13-25-6 (1) (c). Nothing hereunder shall be construed to preclude recovery in an action against a tort-feasor of benefits recoverable in excess of the minimum coverages required in section 13-25-6 (1) (c).

13-25-14. *Quarterly premium payments.* (1) Authority is hereby invested in the commissioner to issue rules and regulations establishing quarterly premium payments for persons who are required to purchase insurance under this article and who are qualifying low income persons as that term is defined in subsection (2) of this section.

(2) For purposes of this article a qualifying low income person shall include any registrant of a motor vehicle in this state other than an organization engaged in trade or business organized for charitable purposes and other than a dependent as that term is defined in the United States internal revenue code of 1954, as amended, except if such dependent receives more than one-half of his or her support from a person who qualifies as a qualifying low income person under this article, then such dependent may qualify as a qualifying low income person. A qualifying low income person shall include only those registrants whose annual adjusted gross income for federal income tax purposes shall fall within guidelines to be established by the commissioner. Such guidelines shall not be lower than the poverty determinations made annually by the United States department of labor.

13-25-15. *Financial responsibility law not applicable.* Persons who have valid insurance coverage in force complying with the requirements of this article shall be exempt from the duty to comply with the requirements of section 13-7-9 (1) of the "Motor Vehicle Financial Responsibility Act".

13-25-16. *Self-insurers.* (1) Any person in whose name more than twenty-five motor vehicles are registered may qualify as a self-insurer by obtaining a certificate of self-insurance issued by the director.

(2) The director may, in his discretion, upon the application of such person, issue a certificate of self-insurance when he is satisfied that such person is possessed and will continue to be possessed of ability to pay any and all judgments which may be obtained against such person. Upon not less than five days' notice and a hearing pursuant to such notice, the director may, upon reasonable grounds, cancel a certificate of self-insurance. Failure to pay any judgment within thirty days after such judgment shall have become final shall constitute a reasonable ground for the cancellation of a certificate of self-insurance.

13-25-17. *Penalty.* Any person who is a resident of Colorado and who fails to have insurance as required by this article violates any provision of this article for which another penalty is not prescribed by law, is guilty of a misdemeanor and shall, upon conviction thereof, be punished by imprisonment in the county jail for not more than ninety days, or by a fine of not less than one hundred dollars nor more than one thousand dollars, or by both such fine and imprisonment.

Sec. 2. *Purpose—applicability—definitions—construction.* (1) The purpose of this act is to promote the public welfare by regulating insurance rates to the end that they not be excessive, inadequate, or unfairly discriminatory, to prohibit price-fixing agreements and other anticompetitive behavior by insurers, to promote price competition among insurers, to provide rates that are responsive to competitive market conditions and to improve the availability and reliability of insurance. For such purposes the division of insurance of the department of regulatory agencies and the head of the division, the commissioner of insurance, shall be charged with the execution of this act.

(2) (a) This act shall apply to all kinds of insurance except:

(b) Reinsurance, other than joint reinsurance, as provided in sections 72-11-11 and 72-12-12, C.R.S. 1963;

(c) Workmen's compensation;

(d) Title insurance;

(e) Life insurance and annuities;

(f) Insurance against loss of or damage to aircraft and against liability with respect to aircraft;

(g) Life insurance and accident and health insurance;

(h) Assigned risk motor vehicle liability insurance.

(3) Articles 11 and 12 of chapter 72, C.R.S. 1963 as amended, to the extent not inconsistent with this act, shall apply to any rate regulation pursuant to this act,

and shall be specifically applicable under circumstances as set forth in subsection (2) (c) of section 3 of this act.

**SEC. 3. Standards for rates—competition—procedure.** (1) Rates shall not be excessive, inadequate, unfairly discriminatory, destructive of competition, or detrimental to the solvency of insurers as measured by net profit. In determining whether rates comply with the foregoing standards, the commissioner shall consider insurers' earnings on investments of incurred loss and unearned premium reserves.

(2) The division of insurance shall promulgate rules and regulations setting a current reasonable margin of profit which shall be set in the first week of January of each year. Such margin of profit shall be set in order to determine excessiveness or inadequacy of rates, or unfairly discriminatory rates until such margin of profit is changed in accordance with this section.

(2) (a) Except as otherwise provided in this subsection or in subsection (3) of section 6 of this act, prior filing of rates, schedules of rates, rating plans, rating rules and rate manuals with the commissioner or his prior approval thereof shall not be required.

(b) No insurer or rating organization shall use a rating classification or territory unless it has been filed with the commissioner and either he has approved it, or ninety days have elapsed and he has not disapproved it as unfairly discriminatory or violative of public policy.

(c) If the commissioner determines, after a hearing and on the basis of findings of fact and conclusions, that, with respect to any territory or to any kind, subdivision, or class of insurance, competition is either insufficient to assure that rates will not be excessive, or so conducted as to be destructive of competition or detrimental to the solvency of insurers, he shall order that the rates for such insurance or territory shall be regulated pursuant to articles 11 and 12 of chapter 72, C.R.S. 1963, as amended. Such order shall have a specified duration of not more than one year but may be renewed by the commissioner upon appropriate findings of fact, conclusions, and order.

(3) No policy form shall be delivered or issued for delivery unless it has been filed with the commissioner and either he has approved it or thirty days have elapsed and he has not disapproved it as misleading or violative of public policy.

(4) Any requirement in subsections (2) (b) and (3) of this section of filing with or prior approval by the commissioner may be waived by regulation adopted by the commissioner after a public hearing.

(5) Rating classifications and territories and policy forms lawfully in use immediately prior to January 1, 1972, may continue to be used thereafter, notwithstanding the provisions of subsections (2) (b) and (3) of this section.

**Sec. 4. Hearings and judicial review.** (1) Any person aggrieved by any rate charged, rating plan, rating system, or underwriting rule followed or adopted by an insured or rating organization may request the insurer or rating organization to review the manner in which the rate, plan, system, or rule has been applied with respect to insurance afforded him. Such request may be made by his authorized representative, and shall be written. If the request is not granted within thirty days after it is made, it may be treated as rejected. Any person aggrieved by the action of an insurer or rating organization in refusing the review requested, or in failing or refusing to grant all or part of the relief requested, may file a written complaint and request for hearing with the commissioner, specifying the grounds relied upon. If he finds that probable cause for the complaint does not exist or that the complaint is not made in good faith he shall deny the hearing. Otherwise, and if he finds that the complaint charges a violation of this article and that the complainant would be aggrieved if the violation is proven, he shall proceed as provided in subsection (2) of this section.

(2) If after examination of an insurer, rating organization, advisory organization, or group, association, or other organization of insurers which engages in joint underwriting or joint reinsurance, or upon the basis of other information, or upon sufficient complaint as provided in subsection (1) of this section, the commissioner has good cause to believe that such insurer, organization, group, or association, or any rate, rating plan, or rating system made or used by any such insurer or rating organization, does not comply with the applicable requirements and standards of this article, he shall, unless he has good cause to believe such noncompliance is willful, give notice in writing to such insurer, organization, group, or association, stating therein in what manner and to what extent such noncompliance is alleged to exist and specifying therein a reasonable time, not less than ten days thereafter, in which such noncompliance shall

be corrected. Notices under this section shall be confidential as between the commissioner and the parties unless a hearing is held under subsection (3) of this section.

(3) If the commissioner has good cause to believe such noncompliance to be willful, or if within the period prescribed by the commissioner in the notice required by subsection (2) of this section the insurer, organization, group, or association does not make such changes as may be necessary to correct the noncompliance specified by the commissioner or establish to the satisfaction of the commissioner that such specified noncompliance does not exist, then the commissioner may hold a public hearing in connection therewith. Within a reasonable period or time, not less than ten days before the date of such hearing, he shall mail a written notice of the hearing to such insurer, organization, group, or association. The notice given under this subsection shall state in what manner and to what extent noncompliance is alleged to exist, and the matters to be considered at such hearing. The hearing shall not include subjects not specified in the notice. The hearing shall be conducted in accordance with section 3-16-4, C.R.S. 1963, and the commissioner shall have all the powers granted in said section.

(4) (a) If after a hearing pursuant to subsection (3) of this section, the commissioner finds:

(b) That any rate, rating plan, or rating system violates the provisions of this article applicable to it, he may issue an order to the insurer or rating organization which has been the subject of the hearing, specifying in what respects such violation exists, and stating when, within a reasonable period of time, the further use of such rate or rating system by such insurer or rating organization in contracts of insurance made thereafter shall be prohibited;

(c) That an insurer, rating organization, advisory organization, or a group, association, or other organization of insurers which engages in joint underwriting or joint reinsurance, is in violation of the provisions of this article applicable to it other than the provisions dealing with rates, rating plans, or rating systems, he may issue an order to such insurer, organization, group, or association which has been the subject of the hearing, specifying in what respects such violation exists and requiring compliance within a specified time thereafter;

(d) That the violation of any of the provisions of this article applicable to it by any insurer or rating organization, which has been the subject of hearing, was willful, he may suspend or revoke, in whole or in part, the certificate of authority of such insurer or the license of such rating organization with respect to the class of insurance which has been the subject matter of the hearing;

(e) That any rating organization has willfully engaged in any fraudulent or dishonest act or practices, he may suspend or revoke, in whole or in part, the license of such organization in addition to any other penalty provided in this article.

(5) In addition to other penalties provided by law, the commissioner may suspend or revoke, in whole or in part, the license of any rating organization or the certificate of authority of any insurer with respect to the class or classes of insurance specified in such order which fails to comply within the time limited by such order or any extension thereof which the commissioner may grant, by an order of the commissioner lawfully made by him pursuant to this subsection (4).

(6) Any findings, determination, rule, ruling, or order made by the commissioner under this article shall be subject to judicial review, and proceedings on review shall be in accordance with the provisions of section 3-16-5, C.R.S. 1963.

**SEC. 5. Prohibition of anticompetitive behavior.** (1) (a) No insurer or rating organization shall monopolize or attempt to monopolize, or combine or conspire with any other person or persons to monopolize in any territory, the business of insurance of any kind, subdivision, or class thereof.

(b) No insurer or rating organization shall agree with any other insurer or rating organization to charge or adhere to any rate, although insurers and rating organizations may continue to exchange statistical information.

(c) No insurer or rating organization shall make any agreement with any other insurer, rating organization, or other person to restrain trade.

(d) No insurer or rating organization shall make any agreement with any other insurer, rating organization, or other person the effect of which may be substantially to lessen competition in any territory or in any kind, subdivision, or class of insurance.

(e) No insurer may acquire or retain any capital stock or assets of, or have any common management with, any other insurer or insurers, if the effect of

such acquisition, retention, or common management may be substantially to lessen competition in any territory or in any kind, subdivision, or class of insurance.

(f) No insurer or rating organization shall make any agreement with any other insurer or rating organization to refuse to deal with any person in connection with the sale of insurance.

(g) No rating organization or member or subscriber thereof shall interfere with the right of any insurer to make its rates independently of such rating organization or to charge rates different from the rates made by such rating organization.

(h) No member of or subscriber to a rating organization shall refuse to do business with, or prohibit or prevent the payment of commissions to, any licensed agent or broker on the ground that such agent or broker does business with an insurer which makes its rates, or any portion thereof, independently of such rating organization.

(i) Nothing contained in this act shall be construed as requiring any insurer to become a member of or a subscriber to any rating organization, or as preventing any insurer, while a member of or subscriber to a rating organization, from making its own rates for any kind, subdivision or class of insurance, for which it does not elect to authorize the rating organization to act on its behalf.

(j) Any insurer which is a member of or subscriber to a rating organization may make its own rates for any kind, subdivision or class of insurance. No rating organizations shall have authority to act on behalf of any insurer which is a member of or subscriber to such rating organization except as authorized in writing by such member or subscriber, which authority may be supplemented, modified or revoked, in whole or in part, at any time by such member or subscriber at its option.

(k) No rating organization shall have or adopt any rule or exact any agreement, or formulate or engage in any program, the effect of which would be to require any member, subscriber, or other insurer to utilize some or all of its services, or to adhere to its rates, rating plans, rating systems, underwriting rules, or policy forms, or to prevent any insurer from acting independently.

(2) (a) Any rate made in violation of subsection (1) of this section shall be disapproved by the commissioner pursuant to the procedures prescribed in subsection (2) of section 7 of this act, and each violator shall be subject to the penalties provided in subsection (3) of said section 7.

(b) The commissioner, through the attorney general, and any person injured in his business or property by reason of anything forbidden in subsection (1) of this section may maintain an action to enjoin any violation of such subsection.

(c) Any person injured in his business or property by reason of anything forbidden in subsection (1) of this section may maintain an action and shall recover threefold the damages by him sustained.

**Sec. 6. Public disclosure.** (1) All policy forms and rating classifications and territories filed with the commissioner shall be available for public inspection at the division of insurance.

(2) Every rating organization and every insurer which makes its own rates, within a reasonable time after receiving written request therefor and upon payment of such reasonable charge, as it may make, not to exceed one hundred dollars, shall furnish to any insured affected by a rate made by it, or to the authorized representative of such insured, all pertinent information as to such rate.

(3) Every insurer and rating organization shall monthly furnish the commissioner all changes in the rating rules and schedules of rates such insurer or rating organization is then using in this state, and shall quarterly furnish the commissioner statistical, rating, and other information in support of changes in rating rules, schedules of rates, and rating classifications and territories. Such rules, schedules, and information shall be available for public inspection at the division of insurance.

**Sec. 7. Enforcement.** (1) The commissioner may, as often as he deems it expedient, examine any insurer or rating organization to ascertain whether its rating and underwriting practices are in accordance with law. Filed reports on examinations shall be available for public inspection at the division of insurance.

(2) (a) If the commissioner determines after a hearing that any rate used by an insurer does not comply with this act, he shall order that such rate be disapproved, and such order may include provision for premium adjustment.

(b) Pending a hearing, the commissioner may order the suspension, prospectively, of a rate used by an insurer and reimpose the last previous rate in effect,

in which event he must, unless the requirement is waived by the insurer, hold a hearing within fifteen days after such order. Within fifteen days after the close of the hearing the commissioner shall make his determination as to whether the rate should be disapproved.

(c) At any such hearing, the insurer shall have the burden of justifying the rate in question. All such determinations of the commissioner shall be on the basis of findings of fact and conclusions. If the commissioner disapproves a rate, the disapproval shall take effect not less than fifteen days after his order and the last previous rate in effect for the insurer shall be thereupon reimposed for a period of six months unless, prior thereto, the commissioner shall approve a different rate.

(3) If the commissioner, after notice and hearing, finds that any insurer, rating organization, or other person has violated this act, he shall order the payment of a penalty not to exceed fifty dollars for each such offense, and if he so finds that such insurer, rating organization, or other person knowingly violated this act, he shall order the payment of a further penalty not to exceed five hundred dollars for each such offense. The issuance, procurement, or negotiation of a single policy of insurance shall be deemed a separate offense.

**SEC. 8. Evaluation.** (1) The commissioner shall, from time to time, report to the governor and the general assembly evaluating the operation of this act, and shall submit a final report no later than March 1, 1975.

(2) The commissioner shall appoint a consumers advisory council to advise and assist him in evaluating the operation of this act pursuant to subsection (1) of this section.

**SEC. 9. Priority of act.** This act shall take precedence as to all types of insurance subject to its provisions, and the provisions of sections 72-11-2 (3) and 72-12-2 (a), C.R.S. 1963, allowing designations by insurers as to the applicability of laws, shall not be applicable with respect to this act.

**SEC. 10. Effective date.** This act shall take effect April 1, 1972.

**SEC. 11. Severability clause.** If any provision of this act or the application thereof to any person or circumstances is held invalid, such invalidity shall not affect other provisions or applications of the act which can be given effect without the invalid provision or application, and to this end the provisions of this act are declared to be severable.

**SEC. 12. Safety clause.** The general assembly hereby finds, determines, and declares that this act is necessary for the immediate preservation of the public peace, health, and safety.

#### SYNOPSIS (CH. 73, ADDS PAR. 755B)

Amends Illinois Insurance Code. Requires, in all automobile liability policies issued after December 31, 1971, certain mandatory minimum benefits, including \$2,000 medical expenses and limited loss of income for disability. Provides for coverage of insured's family, guest passengers and pedestrians. Provides for arbitration of claims in certain circumstances. Denies subrogation to insurer for compensation paid to insured for damage to his own motor vehicle if such compensation does not exceed \$3,000. Provides for commission to study vehicle property damage problems and report to Governor by January 1, 1972.

LRB 4223-77

AN ACT to add Section 143b to the "Illinois Insurance Code", approved June 29, 1937, as amended

*Be it enacted by the People of the State of Illinois, represented in the General Assembly:*

**SECTION. 1.** Section 143b is added to the "Illinois Insurance Code", approved June 29, 1937, as amended, the added Section to read as follows:

**Sec. 143b.** (1) *After December 31, 1971, every automobile liability policy covering any private passenger motor vehicle issued or delivered in this State on a non-fleet basis shall provide minimum hospital, medical and disability benefits to the person insured thereunder and members of his family residing in the same household who are injured in a motor vehicle accident, including guest passengers injured while occupying the insured motor vehicle and pedestrians struck by the insured motor vehicle as follows:*

(a) *All reasonable and necessary expenses for medical, hospital, dental, surgical, ambulance, prosthetic, nursing and funeral services incurred within 6 months after the automobile accident up to an aggregate of \$2,000.*

(b) .85 percent of the loss of income from work for a period not exceeding 26 weeks, but not to exceed \$150 per week.

(c) All payments prescribed hereunder shall be made within 30 days after proof of loss has been submitted to the insurance company. Where losses can be reasonably presumed beyond a 90 day period, partial payments should be made no less often than every 30 days.

(2) Benefits as set forth in paragraph 1 shall be reduced or eliminated if they are similarly provided under any other type of insurance policy covering such injured person, or such person is entitled to benefits under the Workmen's Compensation Act, approved July 9, 1951, as now or hereafter amended, governmental benefits or gratuitous benefits. However, the existence of a cause of action in tort by such persons arising out of the accident does not relieve the insurer's obligation to pay benefits under this Section.

(3) The insurance company may exclude benefits to any injured person mentioned in paragraph 1, whether the named insured or another person covered under the policy, where such person was the operator of the insured vehicle and his conduct contributed to his injury in any of the following ways:

(a) intentionally causing injury to himself;

(b) operating a motor vehicle while under the influence of intoxicating liquor or narcotic drugs;

(c) operating a motor vehicle without a license or after suspension or revocation of this license;

(d) operating a motor vehicle upon a bet or wager or in a race; and

(e) seeking to elude lawful apprehension or arrest by a police officer.

The benefits provided in paragraph 1 of this Section may also be excluded if the injury suffered is in an out-of-state accident by one who is not a named insured, not a member of the named insured's family residing in his household, and not a guest passenger in an automobile owned or operated by the named insured.

(4) Nothing in this Section prevents the insurance company from providing broader benefits than those minimum benefits described herein.

(5) If any person receiving benefits under the provisions of this Section files an action for damages for bodily injury or death arising out of the same automobile accident in any court in this State, such benefits shall not be disclosed to the court, or to the jury, if any. In the event of arbitration of such action such benefits may be disclosed to the arbitrators.

(6) In the event of any claim or legal action by the injured, as described in paragraph 1, against a third party, then the insuring company shall have a right of lien, upon notice by certified mail and return receipt, against the involved third party, and the injured party. The amounts paid out by the insurer to the injured party described in paragraph 1 are to be paid out on a loan-receipt basis and in the event the injured party, through a claim against a third party, recovers any amount by settlement, judgment or arbitration, then the insurance company shall be reimbursed in full from the amount recovered without deduction of fees or expenses of any type.

(7) In the event that the injured party as described in paragraph 1 brings legal action against an involved third party where the amount in controversy in such action is \$3,000 or less, then such action shall be arbitrated in accordance with the rules of the Supreme Court of Illinois when there is a determination by the Administrator of the Illinois courts that there exists unreasonable court delay in the judicial circuit where the action is commenced. The determination by the Court Administrator shall be conducted pursuant to Supreme Court rule. All arbitration awards shall be subject to trial de novo pursuant to Supreme Court rule. In the event of a trial de novo, the decision of the arbitrator shall be admissible in evidence. Arbitration shall not be required under this paragraph after June 30, 1975.

(8) In the event the injured party as described in paragraph 1 has not filed suit within 6 months of the injury or within 6 months of the last payment of benefits mentioned in paragraph 1, then the insurer may institute its own action under inter-company arbitration procedures when the amount in controversy is less than \$3,000 or by court arbitration pursuant to Supreme Court rules where the amount in controversy is more than \$3,000. The insurance companies involved may by agreement have inter-company arbitration without regard to any limit of the amount in controversy.

(9) All property damage claims where the amount in controversy is \$5,000 or less shall be arbitrated in accordance with the rules of the Supreme Court of Illinois when there is a determination by the Administrator of the Illinois Courts

that there exists unreasonable court delay in the judicial circuit where the action is commenced. The determination by the Court Administrator shall be conducted pursuant to Supreme Court rule.

(10) Notwithstanding anything in the insurance policy to the contrary, an insurer who makes payments to its insureds to compensate for damage to its insured's motor vehicle and equipment and property situated therein shall not be subrogated to the rights and causes of action which its insured may have against other persons for such damage unless the amount in controversy exceeds \$3,000.

(11) In any case where an insurance company has paid benefits accruing hereunder to a claimant injured by a person who is not covered by liability insurance provided by an insurer licensed to issue automobile liability insurance in this State, the company paying such benefits shall, to the extent of such payments, be subrogated to any right of action for damages by the claimant against such person.

(12) Benefits provided under this Section may be deducted from any recovery received by an injured person under uninsured motorists coverage as defined by Section 143a of this Code.

(13) The Governor shall, by executive order, establish a study commission, composed of 7 members, to investigate ways and means of reducing the current magnitude of automobile property damage costs sustained by claimants and paid for by insurance companies. The commission shall report its recommendations to the Governor by January 1, 1972.

#### SYNOPSIS (CH. 110, PAR. 2)

Amends the Civil Practice Act to provide that the Supreme Court may provide for the arbitration of civil cases where the amount in controversy is less than \$5,000. Arbitrators shall be chosen by the court from a list of attorneys. Any party may appeal from the award of the arbitrators.

#### LRB 4224-77

AN ACT to amend Section 2 of the "Civil Practice Act", approved June 23, 1933, as amended

Be it enacted by the People of the State of Illinois, represented in the General Assembly:

SECTION 1. Section 2 of the "Civil Practice Act," approved June 23, 1933, as amended, is amended to read as follows:

SEC. 2. Power of courts to make rules. (1) The Supreme Court of this State has power to make rules of pleading, practice and procedure for the circuit, Appellate and Supreme Courts supplementary to but not inconsistent with the provisions of this Act, and to amend the same, for the purpose of making this Act effective for the convenient administration of justice, and otherwise simplifying judicial procedure, and power to make rules governing pleading, practice and procedure in respect of small claims, including service of process in connection therewith. Unless otherwise indicated by the text, references in this Act to rules are to rules of the Supreme Court.

The Supreme Court of this State has the power to make rules providing for the arbitration of any case filed in the circuit court where the amount in controversy shall not exceed \$3,000, exclusive of interest and costs. The Supreme Court shall maintain a list of attorneys who have agreed in writing to serve as arbitrators, subject to the right of each attorney to refuse to serve in a particular assigned case, and subject further to the right of any party to show good cause why an appointed arbitrator should not serve in any case to which he is assigned. The rules shall provide that any case, subject to arbitration, shall be assigned for hearing to a single arbitrator selected by the court from the list of arbitrators in reasonable rotation. Arbitration proceedings may also be assigned to any associate judge or circuit court judge. Cases not at issue and controversies not filed in any court may be referred to arbitration by an agreement of reference signed by counsel for both sides in the case of controversy. The agreement of reference shall define the issues involved for determination in the arbitration and may also contain stipulations with respect to agreed facts, issues, or defenses. In such cases, the agreement of reference shall take the place of the pleadings in the case and be filed of record.

*The rules may provide for the taking of evidence in the form of reports, statements, itemized bills, or in any other manner without the procedural and evidentiary limitations which obtain in jury trials.*

*The arbitration award shall be in writing, signed by the arbitrator, and filed with the court. The award shall be entered by the court in its record of judgments, and shall have the effect of a judgment upon the parties unless reversed upon appeal. Any party may appeal from the arbitration award to the court in which the award is entered by filing, within the time limited by rule of court, a demand for trial de novo on law and fact.*

*Each arbitrator who is not a member of the judiciary shall be paid \$35 per day for each day necessarily expended by him in the hearing and determination of the case. The compensation of the arbitrator shall be paid by the county, in which the court has jurisdiction, from its general revenues and shall not be taxed as costs. Upon appeal, at the time of filing the demand for trial de novo, and as a condition of filing, the appellant shall deposit a cash sum equal to the total award with the clerk of the circuit court of the county. The appellant shall also deposit a cash sum equal to the total compensation of the arbitrator, but not exceed 10% of the amount in controversy, which sum shall be forthwith repaid to the county.*

(2) Subject to rules the circuit and Appellate Courts may make rules regulating their dockets, calendars, and business.

Senator HART. And Mr. Joost, in addition to a variety of points he called to our attention, was speaking also, I think, to the point of the need for Federal rather than State-by-State approach. As you say, we can agree or disagree with that point of view, but he was explaining why, in his judgment, it was essential.

Mr. MARKUS. If I may comment on that, Senator Hart, if one were to ask me whether I would like a bad Federal bill or a bad State bill, I would say that is a choice between arsenic or cyanide. The only decision I have to make is whether it is a good bill, not whether it is Federal or State.

Senator HART. To the specific point you made in your brief statement that perhaps we should have asked you rather than Mr. Joost about LIFT and ADOPT, it is my recollection we did ask you about both.

Mr. MARKUS. Yes, and I believe I very candidly gave all of the information that I thought was requested.

I would be happy to give you any further information if anybody wishes it. Again we are very proud of this involvement by lawyers in the political process. Frankly we wish it were more effective.

I can say, however, in that context, that I understand the Texas Legislature finally adopted some of the legislation which we think the public considers desirable, without regard to the no-fault discussion, such as comparative negligence, this sort of thing. And I think most of the members of this committee would agree that is good legislation.

Regrettably the Governor has vetoed that legislation and the newspaper story that followed Mr. Joost's testimony would suggest that all of the legislators in Texas are somehow in the employ of trial lawyers. Obviously that is foolish, and it is only harmful to good legislation.

Senator HART. I think he said the batting average was six out of eight supported were elected. But I wouldn't want anybody to go down my campaign contribution list and conclude I was therefore an agent of anybody. He was just making a point, however, that I think is supported factually. And we did ask you about the Federal-State relations program.

Mr. MARKUS. And I believe I answered with the same completeness.

If there are any further questions, I would be happy to answer further. I have no question—

**Senator HART.** Do you dispute any of the facts that Mr. Joost gave us?

**Mr. MARKUS.** I believe that some of the statements, if the Senator requests, are, I think overstatements and I would prefer, unless the Senator really wishes me to, I would prefer not to quibble with him. I think he suggested, for example, that lawyers claim to have control over various legislative bodies. I have had occasion to talk to other people who were at those meetings and who unequivocally denied that is true. The lawyers have said they believe their position was being given greater favor in certain legislative bodies, but I have never met a lawyer who claimed any lawyer or lawyer group controlled any legislative body. In fact, as the Senator I am sure knows, lawyers are considered an anathema, are considered persona non grata in most legislative conclaves, because they are always looked at with aspersions.

**Senator HART.** Senator Cook?

**Senator COOK.** Well, Mr. Markus, I think there are some things that we ought to get straightened out. They make good print, but for instance he stated, "when I was hired by the American Trial Lawyers Association in 1967, I had to agree to make no further public statements in opposition to the position of the association on no-fault."

If in fact that was the position of the American Trial Lawyers Association, and it was a strong position of the association, that is not an unheard of request, is it?

**Mr. MARKUS.** Actually, Senator, I would think it would not be an unheard of request, but I don't believe it was made. To the best of my knowledge no such request has ever been made to any staff member. To the best of my knowledge our staff members are individuals who have a right to express their opinions. Obviously if they are going to say our association is doing wrong things, we would prefer they not do it while they are employees of the association.

**Senator COOK.** I doubt seriously any member of the Senate would hire somebody as a staff member who would disagree totally with the Senator as to what he put in his monthly letter.

**Mr. MARKUS.** No, and I might say to the best of my knowledge, from my limited contact with Mr. Joost, I always thought his position was substantially similar to that of the association. I he had a contrary position, he did not explain it to me.

**Senator COOK.** Mr. Finn, if at the meeting in Chicago you said let's all adopt the program you referred to as LIFT, and no one disagreed, there doesn't seem to really be anything wrong with that, does there?

**Mr. FINN.** Senator Cook, I may not have used those words. I am in favor of lawyer participation to the extent that President Markus has indicated. I think it is a laudable thing that all citizens interest themselves in good government.

**Senator COOK.** Mr. Chairman, as you may remember, I didn't totally agree with all of the language, but I did put into the record a resolution of the Kentucky Bar Association which just met and unanimously adopted a resolution opposed to no-fault insurance.

I don't know what political machinations have been going on within the confines of the Kentucky Bar Association, but I somehow or other feel that if a bar association in meeting at a State convention takes that position, that resolution should be put into the record. I am not quite sure whether there are any political activities in the Ken-

tucky Bar Association in that regard or not, but I don't find, whether I agree with them or not, that there is anything wrong with a bar association taking that position. Neither am I sure that that position relies totally and completely on the fact that all of those lawyers in that room were negligence lawyers and all of those lawyers came to the conclusion that this somehow or other was going to take them out of the fat womb, as the witness yesterday said, of collecting all of the money from negligence cases in the automobile industry. Would you?

Mr. MARKUS. Senator Cook, I would like to strengthen what you are saying, if I can, by saying that whenever our governing body has met, to the best of my recollection, if anyone dared to suggest that we should take any position because it was in the self-interest of our members or our association, he would be promptly excluded from the room. We have rather strongly felt—

Senator HART. He would be sent to an insane asylum, wouldn't he?

Mr. MARKUS. Senator, seriously, if someone from our group said we should favor something that is against the public interest, we could not countenance that. We very strongly consider we are the people's advocates and we cannot countenance anything which we think is against the public interest.

Mr. FINN. If I may, Senator Hart, I would just like to comment on part of the testimony yesterday which related to the keymen meetings. I am likewise proud of these keymen meetings. I was the one who set them up. During the meetings of the past year, my first year as national legislative chairman, no discussion was held at any time with reference to no-fault.

Senator HART. I beg your pardon, I missed that.

Mr. FINN. During my first year, last year, as national legislative chairman of the American Trial Lawyers Association, no discussion was held at any of those meetings with regard to no fault. Those meetings were full day meetings, in the cities indicated in yesterday's testimony, those meetings dealt solely with the matters which were indicated by president Markus, and at least half of those meetings were devoted to an intensive investigation and discussion of private remedy statutes, particularly consumer protection laws, environmental protection laws, discrimination laws, and inadequate housing laws.

Senator HART. I am not sure it would be useful to go through fact by fact the statement—

Mr. MARKUS. If the Senator wishes to, I will be pleased to comment on any of them; we have no secrets.

Senator HART. I find Mr. Joost's prepared statement, he is talking about the key men meetings. The 1971 meetings were devoted exclusively to how to defeat no fault at both the State and Federal levels.

Mr. FINN. May I explain that? I was referring to the series of five meetings held last year in Cambridge, Mass., Atlanta, Ga., Las Vegas, Nev.; Denver, Colo.; and Chicago, Ill. That was during last year.

This year there have been two keymen meetings held, one in Cambridge, Mass., and one in Chicago. Both of those meetings did deal with no-fault legislation.

Senator HART. So his statement with respect to 1971 is correct.

Mr. FINN. There have been two such meetings; yes, not five.

Senator HART. Because politicians are always explaining fees that they receive or in some cases decline, and since you would know, what is your arrangement with Prof. David Sargent of Suffolk University.

Mr. FINN. To the best of my knowledge, Professor Sargent is paid for his travel expense and I believe also an honorarium, generally by the group that has invited him, which is usually local groups. It is not funded from the association. I believe it is done the same way Professor Keeton of Harvard Law School and Prof. Jeffery O'Connell of Illinois are treated. They also appear at seminar programs, usually taking the opposite position.

May I supplement that statement, Senator, because Professor Sargent was mentioned yesterday in the testimony of Mr. Joost. Professor Sargent is an outstanding professor and he was a member of the original study commission participated in by Professors Keeton and O'Connell, and he was one of the closest men to that study. He, during the course of that study concluded that no-fault legislation was not in the public interest. And he has been a dedicated advocate against no-fault legislation, based on principle. The implication that he is a hired hand is terribly unfair.

Senator HART. The witness yesterday did—and I have to paraphrase—but did describe the professor as an able, keen student in the field. He did make that point. This is what he said :

Dave Sargent—I see no objection to his appearance or to his being paid. David Sargent is a very able professor. He has a view on the subject matter that demands the most careful and complete discussion, but I do find it less than honorable that Professor Sargent appears wearing his Suffolk hat rather than the Trial Lawyers' hat, and his audiences are not told who is paying him nor how much.

I suppose that could be said of anybody who wears the academic badge, but who is paid by an interest. Whether he speaks out of principle or out of hire. It gets to the point where the politician himself has found it is much more prudent to disclose and let the public evaluate in light of how big the fee is.

Mr. MARKUS. As I said before, Senator, like other academicians who appear at the request of local groups, it is common that they are paid their travel expense and I guess an honorarium that has some relationship to their own time. Though I do not have the factual knowledge, I have every reason to believe that Prof. Robert Keeton and Prof. Jeffery O'Connell who take the opposite position are similarly treated by similar local groups and I do not criticize them for that. Indeed I have considerable esteem for both of them.

I am a classmate of Professor O'Connell and when we have appeared on debates together, I have always said since graduation one of us has gone wrong and we are not quite sure which.

Senator COOK. Mr. Markus, doesn't it impress you to be just as dishonorable to work for an association and put forth all of your time and effort within the framework of that association and totally disagree with the position of that association?

Mr. MARKUS. I prefer not to comment, Senator.

Senator HART. At one of the keymen meetings, recent keymen meetings—maybe Mr. Finn was present—somebody was complaining that Sargent's rates were going up. The delegate said he is now asking \$500.

Mr. MARKUS. I have no knowledge of what Professor Sargent's honorarium is. I know on occasions I have heard of high honorariums for other academicians; I have no idea what he expects. I know that I usually don't get any.

Senator HART. Perhaps Mr. Finn knows whether that comment was made in his presence?

Mr. FINN. That comment was made. I don't know if it was made in his presence. I can't remember, Senator Hart, who made the comment.

The meeting in Chicago was designed to cover the Midwest part of the country and the area which was covered extended as far as, I think, Iowa, and it may be if Professor Sargent was called upon to travel across the country, taking a considerable amount more of time than if he had come to Washington, the honorarium may have been increased by virtue of that fact. I do not have any direct knowledge of what was paid and by whom. I do know that Professor Sargent was invited to debate in New Jersey, that he was paid an honorarium for his appearance in New Jersey, and that the American Trial Lawyers Association did not pay that honorarium.

Senator HART. Just this last one as a point of information. Referring again to Mr. Joost's testimony, he says that at that meeting, a meeting of the trial lawyers in Chicago on April 24, the executive committee of the American Trial Lawyers Association unanimously approved a resolution creating a completely new department, the department of Federal-State relations with a proposed budget for the fiscal year to begin April 1 of \$322,200. Is that correct?

Mr. MARKUS. I presided over that meeting and I can give you rather accurate information as to what occurred.

Senator HART. Let me conclude his statement—

Mr. MARKUS. He was not present at that meeting.

Senator HART. He said:

I was notified. The Executive Committee voted to finance the budget for this new department by (1) reducing the budget of the Department of Public Affairs and Education by \$112,000 and by dues increases expected to net an additional \$200,000. As part of the cutback in the Public Affairs and Education Department, its Director was ordered to dismiss, the only lawyer, at the end of the fiscal year, and Mr. Caldwell and two additional staff members. The director of the new Department of Federal-State Relations, a department incidentally which goes from nonexistence to becoming the largest department, consuming 25 percent of the Association's total budget, the director will be Mr. Allen Locke. Mr. Locke is not a lawyer, but his brother, Barry Locke, is an aide to Secretary Volpe.

Are there any inaccuracies in that?

Mr. MARKUS. There are considerable inaccuracies. And I don't criticize Mr. Joost. He has no reason to know the accurate information. He was not present at the meeting, he wouldn't be expected to be present at the meeting and he is supplying the information from hearsay.

First, it is correct that the executive committee recommended to the budget committee who would then subsequently recommend to the board of governors, and that meets in 2 weeks, and who will, if they agree, subsequently recommend to the general membership, who must approve, at Portland, Oreg. this summer, a budgetary change. That budgetary change, which is so far in the recommending stage, and in no way the approved stage, would describe some activities that are

already performed by the organization, and rechannel the jurisdiction in which those are handled. They would transfer from what are now the public affairs department to another department that would take over some responsibilities handled now by the public affairs department, certain activities which were called I believe, for lack of a better name, Federal-State relations. Mr. Allen Locke, who was referred to, was considered as one possible person who would not head that department, but who would work in that department. And I might say his previous experience has been in our continuing legal education program, he has been helping to run the seminars that we have been giving to lawyers, not on political matters, but on how to help them be better lawyers.

Since he has done so across the country, he has gotten to know many lawyers and the thought was he would be a good person to help with State organizations, in developing the State organizations and in developing their relationship with the national organization, that would be his function.

With reference to the—I don't recall whether any other personnel were described in this. Again if the committee wants me to, I will be happy to describe all of the personnel involved in these things. There are no secrets.

Senator HART. He said it was a proposed budget. Does that reflect the proposed budget?

Mr. MARKUS. The numbers he stated are close. They are not precise. As I say, they do not represent a great new activity, rather a shift of jurisdiction over activity, and to an extent an increase in that activity. I might say that we are hoping to provide to this Congress people who will be able to communicate with the Congress, and find out whether there are questions that we feel very competent people can help provide answers to. I might say I consider myself one of those, and that myself and others who have studied this want to be able to communicate our position and our thoughts and our factual information to the Congress. We will also be using what we think will be helpful people to assist the Congress in understanding our position and we hope in drafting good legislation, and not Mr. Allen Locke. That is not his function.

Senator HART. You are communicating well, and yesterday Mr. Joost communicated well, at least on my wave length.

Senator Cook?

Senator Cook. Mr. Markus and Mr. Finn, your activities are no different than the activities which have been carried on for years and years by the AMA, and of more recent vintage by those groups who opposed the SST, I expect. I might suggest to you they are no different—I see some smiles from the press table—they are no different than the newspaper industry which right now is talking to everybody on the Hill because it is proposed that the mailing rate for newspapers take a substantial increase shortly. They are very, very disturbed about this, and they say this is really going to hurt them. Yet, they have been mailing out 100 newspapers for what it costs you and I to send one letter.

So these activities don't seem to be any different, do they?

Mr. MARKUS. Only in size. I am afraid we can't compete with any of those groups that you have described. I am afraid we cannot pro-

vide the personnel or the funds that they have done. I might say, however, that your last example is one that strikes me particularly at home. It seems to me that to say a lawyer should not be listened to because some lawyers' financial interests are affected is the same as saying that a newspaperman should not be heard to defend freedom of press.

We think we should be heard to defend the rights of individuals.

Senator COOK. This is one of my real arguments with that industry, because they are the only industry in the United States that is not subject to the child labor laws. They have always been excluded from the child labor laws and it has always seemed rather strange to me that an industry which editorially, at least, and sometimes on the front pages, is very critical of some thing that can go on, employs 14- and 15-year-old youngsters to get your newspaper to you in the morning. I only make the comparison because I think however much Mr. Joost enjoyed writing this letter and thought it was a tremendous uncovering episode, you are not here to criticize the gentleman who testified yesterday.

Mr. MARKUS. No.

Senator HART. He had every right to testify and say what he wanted to say?

Mr. MARKUS. Absolutely.

Senator COOK. You are not defending yourself against his testimony?

Mr. MARKUS. That is correct.

Senator COOK. You merely indicate that your basic purpose is to promote what you feel the majority of your organization feels. They feel the proposed legislation before this committee needs a great deal of work. If you took a poll of your members and I note that Mr. Joost said the lawyers in the organization have never been polled, what position do you think it would reflect in your organization.

Mr. MARKUS. I think I can give you a relatively accurate answer. First I can tell you the manner in which our association takes positions is by action of the board of governors who are elected by the members in a geographical fashion, so they are representative. On the basis of the correspondence I have received as president, and on the basis of my conversations with members, my estimate is that if we were to take a poll, the vote would be about 99 to 1 in favor of our position.

Senator COOK. Then you are backing up the position of your association?

Mr. MARKUS. Absolutely.

Senator COOK. And if yesterday's witness did not in any way agree, then he had every right to come here and he had every right to express himself and you have every right to terminate his services?

Mr. MARKUS. I must say, Mr. Senator, we did not terminate his service because of his testimony. His services were terminated prior to that time. We had no knowledge of his intention to present testimony. We terminated his service because of budget, fiscal reasons, that had nothing to do with his position on any subject whatever. We were unaware of his position on this subject.

I do not know whether that has anything to do with his testimony. I only say we were not aware of it at the time he was terminated.

Mr. FINN. May I add, Senator, that I wish I could find the ways or means of disabusing those who are interested in this legislation of

their misconception that the American Trial Lawyers Association is in opposition to this legislation based on selfish, personal interest. The American trial lawyers are opposed to this legislation on one basis alone: We are sincerely convinced that this legislation is not in the public interest.

Senator Cook. Thank you, Mr. Chairman.

Senator HART. Senator Baker?

Senator BAKER. No questions, Mr. Chairman.

Senator HART. I would characterize the testimony of Mr. Joost yesterday not as an exposé of the trial lawyers association, but rather as an explanation of why he believes that we ought to approach the problem of insurance reform.

Specifically, he favors no-fault, on a Federal rather than a State by State approach. There were many other reasons assigned, but included among them was the degree to which the State units could be influenced as a consequence.

Mr. MARKUS. Senator, I only wish I had the confidence that he apparently expressed in our legislative strengths in the various States. I am afraid I don't have that confidence. I wish I did, because I think we are speaking in the public interest.

Senator Cook. The only addition I would want to make to your comment, Mr. Chairman, is that I noted from his testimony that when he was first called by the staff he did not feel that this should be done on a Federal basis but on a State-by-State basis. It was apparently during the course of time that his position was being eliminated that he agonized, thought very, very seriously, and then came to the conclusion that it ought to be done on a Federal basis. His position prior to that time, and all of the time that he had been agonizing with the problem of no-fault, was it should be handled on a State basis and it should not be federally regulated. Apparently, since he was called a month ago, it has only been during the last 2 or 3 weeks, because he finally agonized to the extent that he thought it should be done on a Federal basis, whereas all of those thoughts prior to that time had been it should be handled on a State-by-State basis.

Senator HART. Gentlemen, thank you.

Mr. MARKUS. Thank you for this opportunity, Senator.

Senator HART. Returning now to our scheduled list of witnesses, let me welcome the dean of the Law School of the University of Washington, Dean Richard Roddis.

Dean, the chairman of the committee, Senator Magnuson, had hoped very much to be able to get over before you went on and asked me in the event that he was not able to make it, that I extend his welcome.

I should add that the dean has served as the insurance commissioner of the State of California.

#### STATEMENT OF RICHARD RODDIS, DEAN, UNIVERSITY OF WASHINGTON SCHOOL OF LAW, SEATTLE, WASH.

Mr. RODDIS. Thank you very much, Senator.

You have already indicated a little bit about my background and I won't repeat it. I was also at various other times in the private practice of law in San Diego, Calif., and a deputy attorney general of California.

I think I should also mention two other connections. I was a member of the advisory committee on economic regulation to the automobile insurance and compensation study of the Department of Transportation.

Also I am a director of a mutual property and casualty insurance company.

My views in this matter, of course, are unaffected by any of my professional or other affiliations, and I do not represent or reflect any position or interests other than my own. I might add that is an understatement if you observe some people's reaction to my views.

It is an honor for me to have been asked to appear before you.

My remarks will be directed to S. 945, a bill by Senators Hart and Magnuson to enact a Uniform Motor Vehicle Insurance Act. Though I am certainly not an expert, or at least not as expert on the subject as many other people, it is a subject in which I have had a considerable interest from various perspectives for some years and to which I have devoted some attention.

Over a period of time I have gradually, and I think with some reluctance, come to the conclusion that the methods by which we compensate the victims of automobile accidents of this country are incongruous in theory and unacceptable in performance.

The present system is commonly referred to as the fault liability insurance system. The deficiencies and weaknesses in the system have been chronicled in a host of studies, in endless hearings, and in the common experience of thousands of people. I do not propose to burden you with further detailed offers of proof.

However, I would like to at least enumerate some of the problem areas that I perceive. The present system is anachronistic, operating neither as an effective nor systematic implementation of the policy of social morality which supposedly dominates its tort law aspect, nor the compensation objective which has become dominant in its insurance aspect.

It is inefficient in the distribution of benefits and uneconomical in its exaction of exorbitant costs. It allocates benefits unevenly and inequitably. It unduly burdens the judicial system and diverts its scarce resources away from other imperative responsibilities. It fosters an array of undesirable attitudes and practices on the part of claimants, lawyers, and insurers.

Despite the theoretical claims made by its adherence that it promotes driver care and highway safety, there is considerable evidence that those characteristics of driver psychology and behavior which are really significant in accident causation are largely unaffected by the imposition of fault liability.

Moreover, the record of the years does not suggest that the present system creates in itself any particularly salient pressures for the effective accomplishment of other desirable social objectives, such as safety in vehicle design, emphasis on physical and psychological rehabilitation of seriously injured victims or control of medical and other loss costs.

Indeed what progress has been made in recent years in these areas has been the result of pressures, either independent of or at least purely incidental to the operation of the fault system. Hopefully one can construct a new system which will create more enduring internal pressures for efficiency, economy, loss prevention and control, and rehabilitation.

The present system has posed chronically intractable problems to those concerned with its insurance aspects. The construction of rating and underwriting systems which are at once economically sound, competitively viable, and publicly acceptable, has proven to be beyond our ken, despite many years of the application of devoted ingenuity by legions of casualty actuaries and other experts. I have tried to make the point on many occasions to insurance groups that the basic problem in the rating and underwriting of automobile insurance is that the very things which make the most economic sense from the standpoint of the insurer are bound to be hopelessly unacceptable in the public consciousness.

Most seriously of all, the ills and failures of the system have jeopardized not only the economic health and public confidence in the private insurance economy, but have diminished public respect for the law and for lawyers. It is little wonder so many of us have come to the point where we find it difficult to criticize or oppose just about any of the myriad of changes, whether called palliative, remedial or radical reformist which have been proposed or implemented in recent years. Just about anything is an improvement.

Having said all of this, I want to make two observations about my attitude toward the subject generally.

First, as is probably evident from what I have said so far, I tend to view the problems involved as being essentially systemic.

That is, I believe that the central cause of many of the problems is the incongruity of the combination of a tort liability based on a fault concept, as the theoretical basis for reparations, with an insurance mechanism ostensibly designed to indemnify the liability of tortfeasors, but now in fact generally perceived as oriented primarily toward the objective of broadly distributing the financial costs of assured compensation for injured persons, while yet confining the disparity of premium levels with bearable limits for the average consumer.

Senator BAKER. Since you do not have a written statement, would you reread that statement for me again?

Mr. RODDIS. Yes, sir. I believe that the central cause of many of the problems is the incongruity of the combination of a tort liability, based on a fault concept, as the theoretical basis for reparations, with an insurance mechanism ostensibly designed to indemnify that liability of the tortfeasors, but now in fact generally perceived, both by the public and by legislatures and by the courts I might add increasingly, as functionally oriented primarily toward a social objective of broad distribution of the financial costs of compensation for everyone, while at the same time trying to confine the disparity in premium levels within bearable limits.

Senator BAKER. May I ask a question to make sure I understand that, Mr. Chairman?

The thrust of your remark is that the indemnification aspect of the tort system is no longer the principal basis for compensation, but rather we have an equivalent no-fault system now, the cost of which is borne by the policyholders, rather than by the public generally?

Mr. RODDIS. A dualism of those two things. We persist in adhering to a legal conceptualism based on fault but increasingly we have overlaid it at the insurance level with what amounts to a compensation-oriented treatment. Yes.

Senator BAKER. You mean by the assigned risk pool, by financial responsibility acts, the Michigan system, and others. Is that the reason we now have a compensation system instead of a tort and indemnity system?

Mr. RODDIS. A whole array of things. In the first place, the increasing pressure to put more and more and higher and higher first-party benefits into the coverage. Second, the whole array of judicial precedents which you might say tend to favor the claimant.

Senator BAKER. They tend to diminish the actual cause and effect of the tort concept.

Mr. RODDIS. Yes, all of these things diminish the actual significance of the fault concept, yet leaves the fault concept there, and it becomes an irritant, it becomes a pressure for a kind of adversary relationship, and it becomes a confusing pressure, too.

Senator BAKER. I might refine that, and I won't pursue it further, Mr. Chairman, but I want to be sure I clearly understand.

Mr. RODDIS. I have a few more remarks about it anyway.

Senator BAKER. Let me make sure I am attuned to your frequency on this.

As a rule, the remnant and vestige of the negligence system and the tort concept, coupled with indemnification, form the basis for compensation in this field, coupled with the overlay of a number of factors such as judicial precedents and State statutes, custom, usage, and probably public attitude, so that we in effect have so distorted and diluted or at least changed the tort system and the causal relationship between negligence and indemnification, that we really do not have a fault system now. We have something between a fault system and a no-fault system already without realizing it.

Mr. RODDIS. Yes, sir, that is a good summary.

Senator BAKER. And we have not appropriately reapportioned costs in response to this change in the system.

Mr. RODDIS. Moreover, you continue, you might say, a melded or combined system on a haphazard basis, with all of its cost implications and its implications in terms of frictions and dissatisfactions, and you might say counterincentives to various people within the system.

Senator BAKER. And the delay in bringing cases to trial and disposing of them probably promotes the incentive to settle to the point where it intensifies the no-fault character of the system as well?

Mr. RODDIS. Yes, sir.

Senator BAKER. Thank you, Mr. Chairman.

Mr. RODDIS. We have sought to meld two different and largely inconsistent social objectives into a single integrated system. That the results of such an attempt would be unsatisfactory would almost be expectable simply as an analytic proposition, even without the proof of sad experience. It is this pervasive tension between fault-based reparations ideology and full compensation expectation that actually creates many of the problems of the present system, for it casts upon the various human and institutional components of the system an array of inconsistent roles, it creates unnecessarily adversary relationships, it fosters incentives for undesirable behavior, and it unduly proliferates the legal decision points and uncertainties.

Hence, unlike many people, I do not attribute the problem to the greed or incompetence or bad faith of lawyers or adjusters or agents or

insurance company managers. I recognize that human frailty contributes to the problem and will be a problem under any system, but it is not the dominant cause of our present circumstances, for in my experience most people in all of these groups have been honest and conscientious and well-intentioned.

Many urge that we should seek to accomplish both objectives, unlimited reparations based on fault with a pain and suffering damage element and adequate compensation for all. The pressures for that very result are evident both in the evolution which the present system has already undergone and in the provisions of many of the proposals for reform, including, I might add, S. 945.

If this is what we do, though, I think that we need to make the policy decisions consciously, for the consequences are significant. One consequence is the escalation of costs to unacceptable levels; and another is the array of compromises and resulting frictions in the accomplishment of either objective which the specter of cost overburden forces.

This is exactly what has been happening in the evolution of the present system, and I might add will be compounded by many of the limited reform measures now being advocated. Personally I believe, and I am not a philosopher or psychologist, that public satisfaction, in a sense public happiness, with an institutional mechanism is better promoted by clearer commitment to a primary purpose and concentration on seeing that that goal is accomplished to maximum effect.

Second, I am not a utopian; I recognize some of the problems which exist are intrinsic to the automobile environment in this country and either will exist under any reparations system or must be solved by measures independent of a loss allocation and distribution mechanism.

Moreover, there are a diversity of legitimate interests and viewpoints entitled to consideration which I recognize the political process must accommodate. Yet the fact that any proposal, therefore, will be vulnerable to criticism from some quarter should not deter action.

Now I want to turn to a discussion of some considerations relative to S. 945, the bill presented by Senators Hart and Magnuson. Initially let me say I admire those who drafted the bill. It displays a great deal of ingenuity in concept and drafting. There are many provisions in it which I think are very, very good. There are three aspects which I wish to specifically discuss. I also have a number of more or less technical comments about it which I can supply to the committee staff in letter or other written form.

The three points I want to talk about briefly are:

- (1) The accommodation which the bill makes between first-party compensation theory and the retention of a fault-based tort liability;
- (2) The provisions included in the bill calculated to assure the availability of automobile insurance; and
- (3) the question of the appropriateness of a Federal law as opposed to awaiting solutions at the State level.

On the first point I am something of a purist in that I prefer to move as far as possible in the direction of a pure compensation approach. Ideally I would abolish the fault-based liability and the right to unlimited damages for pain and suffering altogether; however, I recognize the powerful emotional and other pressures involved and do not oppose reasonable compromise. However, the approach taken by

the bill I think has some defects, particularly in that it retains too much room for litigation of a customary type in the catastrophic harm area. It does not provide adequate direct compensation.

Specifically I would suggest the following pattern of modifications:

(1) Amend the section on compensable earnings loss, which is (2) (c), to do these things:

(a) Raise the required minimum limits to \$1,500 per month and 48 months or \$48,000. I apologize for that—it would have to be 48 times \$1,500.

(b) Redefine the compensable earnings loss so as to cover all present and expectable loss or diminution of earnings and then define expectable lost earnings as present earnings except to the extent that circumstances clearly demonstrate the probability that higher levels would be achieved. This is to take care of two problems: First, a person who has low or no present earnings but a clear short-range expectation of entering or substantially improving himself in the remunerated labor force; for example, the student; and second, the factor of inflationary increases in wage rates.

(c) Permit insurers to stipulate in the policy with the primary insured and those whom he may reasonably be regarded as representing as to the actual potential lost earnings.

(d) Amend section 2(12) (a) to add a provision reducing net economic loss by an amount equal to 80 percent of earnings from any substitute occupation.

(2) Define catastrophic harm somewhat differently so as to dovetail more precisely with the direct compensation section; that is, define permanent and total or partial disability as disability extending 48 months, or 30 months if you retain the present limit, and as including disfigurement.

(3) Limit the damages recoverable for economic loss due to catastrophic harm so as to exclude any earnings loss factor within the 48-month or 30-month period.

Second, I want to turn to a discussion of the provisions designed to assure the wide availability of automobile insurance. These provisions have the not inconsiderable virtue of simplicity. Essentially the bill imposes a duty on all auto insurers to write every risk submitted.

I am reluctant to criticize the approach, for it accords with a view I have entertained for some time that our present system has created too many competitive pressures for overly selective underwriting, and that it should be possible to create an environment in which insurers may reasonably be expected to make their product generally available to all at appropriate prices. However, I fear that the section as it stands now is apt to have undesirable collateral consequences within the insurance economy.

First, and apart from everything else, I think that this approach is feasible only if the Congress also preempts out State rate regulation. Under a law of this type, I think rate regulation probably will be unnecessary. The bill has a number of sound provisions built into it designed to enhance independent ratemaking and transparency of the market so that competition may be effective at the consumer level.

These provisions could be fortified by making auto insurance explicitly subject to Federal antitrust laws.

To impose a Federal duty to write every risk submitted, and leave the insurers exposed to the vagaries of State rate regulations, is an invitation to disaster.

If rate regulation were eventually demonstrated to be necessary, I would prefer to lodge the power in the Secretary of Transportation.

Second, and apart from the rate regulation problem, the provision for the availability of insurance will create other dislocations. It will severely affect specialty carriers, some of which have done a very good job and are geared to deal only with their special areas of competence.

Senator BAKER. Like who?

Mr. RODDIS. United Service Auto, for example.

Moreover it will strike hardest at those insurers which so far have been doing the best job of supplying the markets.

It will encourage various rather elementary business manipulations on the part of insurer managements calculated to reduce the impact of the provision on them. And I do not mean to imply, incidentally, that the techniques which would occur to me would be wrongful; indeed I think they would almost be forced upon management from an economic standpoint.

I suggest either of two alternate approaches.

First, retain the present approach, but do these things: (a) Permit insurers to file with the Secretary designations of classes, kinds, or territories of business which they do not choose to write. I would empower the Secretary to promulgate rules and regulations to control such filings, in order to prevent targeting. (b) Permit an insurer to file at any time a statement that it has suspended writing automobile insurance until a further rescinding filing could not be made for, say, at least 90 days.

A second and entirely different approach would be to abandon the provision requiring every insurer to write every risk, and create a federally chartered public corporation, jointly owned by the Government and by all automobile insurers, with power to assess the insurers.

The corporation could write business generally on a businesslike basis and would be specifically enjoined to see that all markets were supplied. Such an insurer could serve two functions: First, to assure the availability of auto insurance and, second, to control rates by the so-called yardstick method of rate regulation.

A final comment in this connection: Apart from everything else, and even if you don't change the bill in any other regard, you should amend section 5(b) (2), which is the one that says that the only circumstances under which an insurer may refrain from accepting further applications is if its domiciliary commissioner has made a written finding that to do so would impair its solvency, should be amended to use a test other than solvency; something like hazard or unsoundness. The word "solvency" poses some technical problems that will make it absolutely unworkable.

Finally, I want to comment on the question of the propriety of Federal as opposed to a State solution. I think a Federal bill is needed. First, all of the factors are present which have conventionally and historically been thought to render a subject appropriate for the exercise of the congressional power to deal with interstate commerce on a uniform national basis.

In other words, there is really nothing so terribly remarkable about what is being proposed in this bill, to have a Federal solution. The auto, if you will forgive a bad pun, is very mobile. Many accidents have immediate multi-State implications. Moreover, the economic consequences are clearly national in scope. The sheer magnitude of the financial stakes establish this fact, if nothing else does.

The next factor is that the States are not apt to act with any great rapidity or uniformity. The real problem in my view is not so much the fact we might go through a period in which we have some States with first-party laws and others with the conventional fault-based tort liability system.

I think if it were merely a two-way dispersion, in other words, if there were really just two choices, we could live with it. But the greater problem is the likelihood that a wide array of diverse plans will emerge among the States. There are a host of subissues involved in the problem. Moreover, there are numerous groups which have an interest in the matter and the relative positions of legislative influence among these groups vary remarkably from State to State.

Hence I think it is likely that we will see a pattern of the emergence of a wide variety of solutions at the State level and that emergence of numerous variable plans will create serious problems from legal and insurance standpoints, as well as bewilderment and dissatisfaction in the public mind.

You know I sometimes think that it is lawyers and legislators that think a lot more about State lines than people do generally today. The average person I don't think really thinks that things ought to be so different simply because he drives from one State to another.

The problem is aggravated by the fact that the applicable choice of law rules have become murky in recent years. When I was in law school, and I suspect that when those other gentlemen here who were lawyers were in law school, the conflict-of-laws people had the problem of choice of law in accident cases fairly simple, the law of the place of the accident pretty well controlled.

I am not a conflict-of-laws man, but my understanding is that in recent years the courts and the legal scholars have devoted a great deal of attention to confusing the situation and have evolved a doctrinal position that pays a lot of attention to the aggregate of contacts, and other such tests, and clearly creates an incentive to a proliferation of forum shopping litigation.

I think that given that kind of a context, as to the choice of law principle involved, and the emergence of a wide variety of statutory plans among the States, we would find ourselves with some very serious legal and insurance problems. That completes my intended testimony.

As I said, I have a number of other comments which I will try to submit to the committee by letter or in some other form. I appreciate the opportunity of having been here.

Thank you.

Senator HART. Dean, thank you very much.

We will welcome and accept your offer of help with some of the technical points that you want us to focus on.

I said this yesterday, let me repeat it: I appreciate very much your commendation to the draftsman of this bill. I don't want to imply that Senator Magnuson didn't write it in longhand, but I sure didn't.

But it gives both of us an opportunity to tell those men who did the drafting that in your judgment it is technically a good job. On that conflict-of-law thing, I am a conflict-of-law man in the sense that I took a course on conflicts, at a time when you described the situation as relatively clear.

It was never clear to me even then, and if it has gotten worse, then we will certainly have to do something.

Senator Cook?

Senator Cook. Dean, I must say your statement has been kind of refreshing to me.

First of all, I think you totally disagree with many of the remarks that have been made previously that somehow or other under a fault system this automatically makes a driver more careful. I think you refute it, and I think you refute it well.

As a matter of fact, I think the fear of having one's policy cancelled is a far greater fear to make someone a better driver than the fact that he may find himself within the confines of the fault, tort liability machinations of the present legal system.

Secondly, in your colloquy with Senator Baker, you point out to those who argue that you are tampering with the tort liability system, that unfortunately that system has become relegated to the system of insurability and it has become second place, not first place.

I think we as lawyers should admit that tort liability existed long, long before the lawyer had to find out before he filed that lawsuit whether there was a degree of insurability.

I think you made this point very well. I really think you ought to be commended for this.

Let me ask you, under a no-fault system which retains for the benefit of its citizens the tort liability facilities and availabilities, do you foresee any constitutional questions involved in such a program?

Mr. Robbins. I think not at the Federal level. There may be State constitutional provisions that would be a problem in some States, at the State level. That could be, in fact, another reason for suggesting the desirability of Federal legislation as being the only practical way of overriding some potentially applicable State provisions.

For example, my recollection is that the New York Constitution has what amounts to a constitutional guarantee. I think of either jury trial or simply nonimpairment of the right to a cause of action for wrongful death. For that reason, for example, in the New York plan, variously called the Stewart plan or Rockefeller plan, they had to exclude wrongful deaths, because of apprehensions about their own State constitutional provision.

Senator Cook. There is one thing you did say that seems to defeat the purpose of what we are discussing today rather than enhance it. That is the ability of a carrier to notify the Secretary relative to your proposition to permit a carrier to exclude types of insurance and areas.

Now, if this is available to one carrier, obviously it is available to all carriers. If we get into this business of even giving a 90-day or 60-day period of eliminating the ability to write coverage, aren't we really defeating the purpose for which these hearings are being conducted?

Unless we immediately say in that same regard, and I don't mean to prolong the question, that whenever this is done in a given area, if

there is no coverage available, it automatically goes to a Federal corporation which would immediately have to step in and render coverage within that 90-day period.

Obviously, we do not want to find ourselves in a position where a given area by reason of types or by reason of area was going to be totally excluded from the availability of coverage.

Mr. Robbins. My thought had been that this right which I would propose giving to the insurers would be rather severely delimited by the suggestion I also made that the amendments should include the conferring on the Secretary of a power to regulate the exercise of that device pursuant to rules and regulations he might adopt to prevent abuse.

I would think you could confer a regulatory power under standards that would be broad enough to avoid the consequences you are apprehending.

Let's take a simple thing for an example. Suppose you did give them the possibility of territorial exclusion. If I were the Secretary and had the regulatory power, I might say no territorial exclusion shall be less than, say, an area of 50 square miles or perhaps even maybe a State or a half a State, something like that. The point being that I would prevent them from this business of red lining out, or targeting areas or something like that.

By the same token, as to classes of business, I wouldn't let them say we aren't going to write unmarried women under 25 or something like that. What I am thinking of is the power to say we write only motorcycle insurance, we won't write any automobiles, or we write, like United Services Auto, we write only this class of business, I think there it is defined probably as military officers, retired officers, and reservists.

I think it would be possible by regulation to control any abuse of this right, and you won't have enough companies that fit these different kinds of categories or think of themselves as doing so to block out a whole area.

Moreover, once they make that filing, they can't write any risks in that category. It isn't a right to get out from under the duty to accept all risks if they write that category at all. They have to make an either/or selection. If they say this is an area in which we do not choose to write, then they can't write anything.

They could voluntarily say we will suspend all writings for a period of time. I think that is far superior to having them running down to convince the insurance commissioner that they are going to go broke if they write any more insurance.

Senator Cook. I am little concerned with the explanation, because I am wondering if carriers could be eliminated from particular areas, you might be creating a monopolistic system within those same areas.

Mr. Robbins. I think that the number and size of automobile insurers operating broadly, both at the national level and locally and regionally, is such that there would always be adequate numbers. Now, I will agree this can become involved with one other point I tried to make and that is what I perceive is the need to abrogate State rate regulation.

In a sense if you don't abrogate State rate regulation, I would think you almost have to have the kind of power I am proposing on the

part of the carriers. Otherwise the distortions you build into the insurance economy nationally will be something to see.

Senator Cook. You think it would be necessary to preempt.

Mr. RODDIS. Yes. But it would be the failure to preempt that would be the only thing that I can think of that would lead to the kind of situation you are apprehending, and that situation would arise if you did not preempt, that is if you permitted State rate regulation, and you had a State insurance commissioner who said to himself: "This is the best of all worlds. The Federal Government says they have to write every risk, and I control the rates."

If he suppresses the rates below reasonable levels, as has on some occasions been done historically in various States, you could get a situation where carriers in the apprehension of the consequences of that would frankly have to make a filing blocking out that whole State. Now, however, that is another good reason for giving them that right, because if you don't given them that right, they will have to turn to withdrawal from the State, perhaps cutting off the writing of other valuable lines in which they are engaged.

Senator Cook. As a consequence of investing the authority in the Secretary to either allow or disallow, based on an application, an insurance company to continue or to classify or to delete areas, I think we just automatically have to follow on the idea of a preemption of rates. I do not think that determination could be handled at this level logically unless you also had control over the structure that applied to that area. Wouldn't that really follow?

Mr. RODDIS. Well, I did not suggest preemption of the rate regulatory power in the sense that you necessarily have to have the Secretary do it. I think, myself, that under this kind of a law, and the insurance economy that I would hope would emerge under this, that you could preempt in the sense that you knock out State rate regulation and rely upon competition and the Federal antitrust laws to be a reasonable governor of price.

If that proved to be unsatisfactory, it was my statement that I would then prefer to have the Secretary control the rates rather than the States. And I agree that I think the coexistence of a federally imposed duty to write every risk with the continuance of State rate regulation is going to be a very unsatisfactory combination.

Senator Cook. One other question. You did not address yourself to one section of the bill that gives me a great deal of concern and that is 3(b), where:

No State shall require the purchase or acquisition of insurance or any other security as a condition to the operation or use of any motor vehicle upon the public streets, roads and highways of such state, other than the insurance required under Section 5 of this Act.

Do you foresee, if such a section were to stay in the bill, that if a no-fault were to be perfected by this committee it would have to be of unlimited consequence?

Mr. RODDIS. No, I do not have that problem with it. But that was one of the sections I was going to comment on in the letter under the general heading of technical and other comments.

I really don't understand the point of that section. I see no reason why an individual State should not be permitted to legally require additional coverages that do not detract from or impair the purpose or effect of the Federal requirement.

In other words, I would not permit a State, I suppose, to do something that was really inconsistent with the purpose of the Federal bill, but I do not understand why the States should be prohibited from requiring reasonable additional coverages.

Senator Cook. Don't you think that with such a section, and the fact that the States conceivably could not act if this section stayed, the consuming public, with the retention of the tort liability feature, might be lulled into minimum coverage and consequently find themselves in a horribly dangerous position if they found themselves brought into court on a matter that far exceeded any coverage that could reasonably be presented in a Federal statute?

Mr. RODDIS. Well, no; I do not think that is the problem, because my recollection is the section, or one of the other sections, does specifically permit optional liability insurance with reference to this catastrophic harm liability. So at least that particular problem would not arise. But there could be other things.

Senator Cook. Suppose an insurance company's options only went so far?

Mr. RODDIS. Oh, I see what you mean. In other words, suppose the Secretary approved a policy that had limited coverage—

Senator Cook. I heard Mr. Sutcliffe say that he cannot, but if he is going to regulate and make these determinations—

Mr. SUTCLIFFE. There is a requirement in the bill that the insurer has to offer the optional coverage.

Senator Cook. Of at least \$50,000 for any one person, \$300,000 for all persons. We have judgments that have been rendered in the last 30 days that make \$300,000 look like peanuts.

Mr. SUTCLIFFE. But the present limits in the States are \$10,000 and \$20,000 for liability.

Senator Cook. The only point I am making is you are putting a limit on the upward side, and they are putting a limit on the downward side. They may require \$10,000 and \$20,000—

Mr. SUTCLIFFE. I think it could be improved a great deal, Senator.

Mr. RODDIS. I agree with you, Senator Cook, on that matter. This was one of the provisions that bothered me. I see no reason why the States should be prevented from requiring at least reasonable additional coverages if they felt that the interests of their citizens so indicated. And one of the illustrations would be to require higher limits.

Senator Cook. One of the greatest examples would be property damage, which this bill does not require.

Mr. RODDIS. Yes. The things that occurred to me were, one, property damage liability insurance, and the other really would be the idea of making the optional coverage mandatory.

I hate to see, as long as you are going to have this liability for catastrophic harm, I hate to see the States in effect forced back from the requirement that some of them have that you have to have that kind of coverage.

So basically I am in agreement with you on this whole matter.

Senator Cook. Mr. Chairman, I have to say I find his remarks very refreshing and I think they add a great deal.

Thank you very much.

Mr. RODDIS. Thank you, Senator.

Senator HART. I certainly share Senator Cook's feeling that what you have told us this morning is going to be, as we attempt to work through this thing, extremely helpful and referred to often.

As a matter of fact, I wish we had had the chance to have it in front of us.

Mr. RODDIS. And I apologize for that.

Senator HART. I appreciate Senator Baker's twice asking for a runthrough of that one long sentence.

Senator Baker?

Senator BAKER. Thank you, Mr. Chairman. I join you and Senator Cook in commending the witness for a very meaningful statement.

I must say that one of the difficulties that comes from not having been at these hearings on each day is trying to understand the statute, so if the witness will bear with me I would like to get down to some fundamental questions he raised.

Is it fair to say in the broadest terms that the situation we have today in the tort system as it relates to the automobile situation is an insurance industry that provides indemnification under a modified tort system and that the thrust of S. 945 is to eliminate some patent inequities in that system and to serve a secondary purpose, a social purpose, of relieving pain, suffering, anguish, and lack of compensation in cases where there is not a traditional response in the tort liability system; and, third, if we do that, to provide a new system of regulation? Is that the broadest scope of the presentation of S. 945?

Mr. RODDIS. Yes; if that includes the idea that I suppose the basic thing here is to eliminate, at least to the extent that you do impose a required direct first-party compensation system, the play of the fault liability concept altogether.

You see the problem I was trying to identify earlier is that the problems arise from the present sort of hodgepodge meld of fault theology and compensation insurance. Though it is true that the system is moving more and more in the compensation direction as a practical matter, the residue of fault theory pervading the thing is what creates so many problems.

You have an insurance mechanism, for example, that doesn't even go the right way contractually. The insured is the tortfeasor, yet the person increasingly viewed as the real beneficiary of the insurance is not someone that is indemnified against the liability, but rather the third-party claimant.

Senator BAKER. If I might be so presumptuous as to caution the dean of a distinguished law school to be careful not to misunderstand what I am saying, I am not criticizing the bill. I am groping for the fundamental principles involved. What you have suggested is that there is a moral issue involved in the lack of direct responsiveness or privity between the injured party and the insurance carrier. That, of course, launches into category 2 that I tried to described, which is the social issue involved.

I am trying to establish if we are in fact talking about three separate and only slightly related issues: One, the insurance industry's relationship to the indemnification aspects of the court system in the United States; two, whether or not we are concerned with the

necessity, if any, for providing additional response above the negligence system on a human and social basis, that is, compensation without fault, directly to the injured party and many other applications; and three, if the answer to two is yes, whether we are completely and totally changing the relationship of the industry to the public and the Government to the point where extensive reordering of regulation of the insurance industry will be mandatory, not desirable, but mandatory?

I ask you, if you will let me, to come back and correct me or agree or disagree on any of those three categories of concern in this field. Then it will lead me to two or three other questions.

I say, again, I am not implying disagreement with any aspects of S. 945, I am not yet dealing with nuts and bolts. I am trying to get my fundamental thinking straight in this field.

Mr. RODDIS. I think your statement of the issues is very good. You said independent issues. I view them as more interrelated.

First, you say—

Senator BAKER. Indemnification and response to the tort system.

Mr. RODDIS. It would do that. It would create a first-party kind of insurance relationship. So that is a basic thing this bill does.

No. 2, it clearly does move heavily, though, as I indicated in my testimony, not as heavily as I would prefer, in the direction of a pure compensation without regard to fault approach, and that is obviously a social policy judgment. There is no question about it.

Senator BAKER. Having little if any relationship to point 1, the tort system?

Mr. RODDIS. No; I stick to the principle that all of these issues are closely interrelated, and that is for one single reason if no other, and that is cost. There is no escape from the cake-and-eat-it-too problem.

Senator BAKER. Not really. That is a semantic difference between you and me, I think.

I am saying they are not related on the theory that the tort system awards indemnification or reparation or compensation only when there is negligence causally connected with the loss or injury, while the no-fault concept is based on humanitarian and social concerns, having no relationship to the causal connection between negligence and responsibility for damages.

Mr. RODDIS. I apologize for not seeing your point sooner. You are saying these issues are severable issues as a matter of philosophy or theory; yes, that is true.

Senator BAKER. And one of them has to do with the modification of the tort concept as a part of the generic laws of the United States and the laws of the States, and the other has to do with the pressures for social change and the response Congress makes to that. They are only slightly related. In policy and principle they are not related at all.

As a practical matter they are closely related because the similarity of the events, more often than not, will both occur in an automobile accident, and in cost it is sometimes difficult to distinguish what is a direct response and what isn't a direct response to tort liability. This, by the way, gets back to the extraordinary point you made when you pointed out, as I never thought of it before, that we can in effect judicially legislate the no-fault system with the evolution and development of the tort law as we know it.

And, point three, if we answer two in the affirmative, we have to do some radical surgery on the system.

Mr. RODDIS. I guess it is on three that I have perhaps a more limited view. As I have indicated, this particular bill has some provisions in it which I think do substantially affect at least the rate regulatory function and I think they are desirable effects on that. Partly they are required, however, by the attempt in the bill to deal with the availability of insurance problems, rather than these other problems.

I once had the theory that it really was not necessary to have any particularly great impact on the basic regulatory pattern simply to enact a Federal no-fault, first-party kind of legislation. My position for some time has been that basically all that was needed at the Federal level was to rewrite the tort law involved, that is the basic principle of liability, and require the needed first-party insurance that is the substitute for the present system and then leave it to the private industry and to the States to respond to that new legal environment, which I think American industry tends to do rather well.

In other words, my point is that the congressional function was to recreate the legal environment, and I thought if you did that the right way, most of the other things would flow from it.

Now, this bill has things in it that I guess require or provide more assumption at the Federal level of the regulatory function; and I do not disagree with those provisions, in fact I think maybe they are sound, but even those I do not think will displace the State regulatory system nearly as much as you might think.

Senator BAKER. What I am really groping for in these broad categories, and defining the areas of concern in the bill, is to determine whether the most basic judgment that must be made by the Congress is whether we are going to fund the demands of category 1 and category 2 out of the user concept by adding it to rates and charges of the insurance industry, or whether we are going to respond partly from the insurance industry and partly from the general treasury, that is, either for social or human considerations.

For example, in the case of an automobile accident where there is no-fault, and still there are parties who may suffer and be unable to work for long periods of time, it is theoretically possible to compensate those people through medicare or medicaid and it is also possible to compensate them from other benefits.

It is the old question of whether or not we make the user pay or the treasury pay. We stretch it over the entire public domain or limit it to a particular segment of the industry. That would require further examination on my part to decide whether or not category 2, that is the human and social considerations, the no-fault aspect of the problem, ought to be taken care of by the user or ought to be more broad-based.

It really gets down to the continuing conflict, the philosophical confrontation in Congress between trust funds and general treasury funds.

Do you care to disagree with that as a description of the most fundamental question we have to raise if we decide something has to be done?

Mr. RODDIS. You touch on a point that I think is very interesting and a fundamental one; yes. I guess as long as I was setting up a sys-

necessity, if any, for providing additional response above the negligence system on a human and social basis, that is, compensation without fault, directly to the injured party and many other applications; and three, if the answer to two is yes, whether we are completely and totally changing the relationship of the industry to the public and the Government to the point where extensive reordering of regulation of the insurance industry will be mandatory, not desirable, but mandatory?

I ask you, if you will let me, to come back and correct me or agree or disagree on any of those three categories of concern in this field. Then it will lead me to two or three other questions.

I say, again, I am not implying disagreement with any aspects of S. 945, I am not yet dealing with nuts and bolts. I am trying to get my fundamental thinking straight in this field.

Mr. RODDIS. I think your statement of the issues is very good. You said independent issues. I view them as more interrelated.

First, you say—

Senator BAKER. Indemnification and response to the tort system.

Mr. RODDIS. It would do that. It would create a first-party kind of insurance relationship. So that is a basic thing this bill does.

No. 2, it clearly does move heavily, though, as I indicated in my testimony, not as heavily as I would prefer, in the direction of a pure compensation without regard to fault approach, and that is obviously a social policy judgment. There is no question about it.

Senator BAKER. Having little if any relationship to point 1, the tort system?

Mr. RODDIS. No; I stick to the principle that all of these issues are closely interrelated, and that is for one single reason if no other, and that is cost. There is no escape from the cake-and-eat-it-too problem.

Senator BAKER. Not really. That is a semantic difference between you and me, I think.

I am saying they are not related on the theory that the tort system awards indemnification or reparation or compensation only when there is negligence causally connected with the loss or injury, while the no-fault concept is based on humanitarian and social concerns, having no relationship to the causal connection between negligence and responsibility for damages.

Mr. RODDIS. I apologize for not seeing your point sooner. You are saying these issues are severable issues as a matter of philosophy or theory; yes, that is true.

Senator BAKER. And one of them has to do with the modification of the tort concept as a part of the generic laws of the United States and the laws of the States, and the other has to do with the pressures for social change and the response Congress makes to that. They are only slightly related. In policy and principle they are not related at all.

As a practical matter they are closely related because the similarity of the events, more often than not, will both occur in an automobile accident, and in cost it is sometimes difficult to distinguish what is a direct response and what isn't a direct response to tort liability. This, by the way, gets back to the extraordinary point you made when you pointed out, as I never thought of it before, that we can in effect judicially legislate the no-fault system with the evolution and development of the tort law as we know it.

And, point three. if we answer two in the affirmative, we have to do some radical surgery on the system.

Mr. RODDIS. I guess it is on three that I have perhaps a more limited view. As I have indicated, this particular bill has some provisions in it which I think do substantially affect at least the rate regulatory function and I think they are desirable effects on that. Partly they are required, however, by the attempt in the bill to deal with the availability of insurance problems, rather than these other problems.

I once had the theory that it really was not necessary to have any particularly great impact on the basic regulatory pattern simply to enact a Federal no-fault, first-party kind of legislation. My position for some time has been that basically all that was needed at the Federal level was to rewrite the tort law involved, that is the basic principle of liability, and require the needed first-party insurance that is the substitute for the present system and then leave it to the private industry and to the States to respond to that new legal environment, which I think American industry tends to do rather well.

In other words, my point is that the congressional function was to recreate the legal environment, and I thought if you did that the right way, most of the other things would flow from it.

Now, this bill has things in it that I guess require or provide more assumption at the Federal level of the regulatory function; and I do not disagree with those provisions, in fact I think maybe they are sound, but even those I do not think will displace the State regulatory system nearly as much as you might think.

Senator BAKER. What I am really groping for in these broad categories, and defining the areas of concern in the bill, is to determine whether the most basic judgment that must be made by the Congress is whether we are going to fund the demands of category 1 and category 2 out of the user concept by adding it to rates and charges of the insurance industry, or whether we are going to respond partly from the insurance industry and partly from the general treasury, that is, either for social or human considerations.

For example, in the case of an automobile accident where there is no-fault, and still there are parties who may suffer and be unable to work for long periods of time, it is theoretically possible to compensate those people through medicare or medicaid and it is also possible to compensate them from other benefits.

It is the old question of whether or not we make the user pay or the treasury pay. We stretch it over the entire public domain or limit it to a particular segment of the industry. That would require further examination on my part to decide whether or not category 2, that is the human and social considerations, the no-fault aspect of the problem, ought to be taken care of by the user or ought to be more broad-based.

It really gets down to the continuing conflict, the philosophical confrontation in Congress between trust funds and general treasury funds.

Do you care to disagree with that as a description of the most fundamental question we have to raise if we decide something has to be done?

Mr. RODDIS. You touch on a point that I think is very interesting and a fundamental one; yes. I guess as long as I was setting up a sys-

tem to provide either compensation or tort reparations, either one, for automobile-injured people, and that is all I was doing, I would try to internalize the costs to the system.

In other words, I think it is fair that the enterprise of automobiling, or as my friend Stewart uses the quaint phrase "motoring," should bear its own cost burdens as fully as possible, whether they be of a compensation nature or a fault-based nature.

Now, I think the thing your suggestion really brings to light is a thought I have had and expressed on a number of occasions, and that is you hear the argument made from time to time that one reason you should not do anything in this area is the dilemma posed by the question of why we should have a legal system that provides full compensation without fault to people who become injured or disabled in auto accidents, where if they fall off a ladder at home they do not have that kind of benefit.

Of course one answer I always give is the purely pragmatic one that quantitatively, and in the public perception, auto accidents are a bigger problem and it is no excuse for not dealing with a problem that you do not go all of the way and deal with everything.

But there is a certain analytic suggestion to that argument, and I have thought for some time that one thing that may really take attention away from this whole auto accident reparations problem if something is not done fairly fast, is it may become swallowed up one of these days by a wider movement for a total medical care and disability benefits system on a national scale.

Of course, if that occurred, you would be talking about funding it through a much broader mechanism than automobile insurance.

Senator BAKER. We may be talking about some future speculative date in history when we have accumulated a considerable amount of money in a Federal trust fund to be a reinsurer of the insurance industry or pay direct claims or the like. Somebody will come along and say we ought not to spend this money for interstate highways, we ought to spend it for urban rapid transit, and maybe we ought to take this money and spend it for getting people over the highways, instead of compensating them.

So we have already had a foretaste of how specialized funding operates.

I may say, parenthetically, I think specialized funding is superior in this case. But there is the philosophical question it seems to me of whether or not we are funding a general social purpose on a specialized narrow base.

Let me extend that one step further, and I will not go much further because I am going to seek the opportunity to talk to you further one of these days, when we don't have to pay the reporter over here.

What about the economic disincentive of the tort system which you have thoroughly and effectively destroyed, and I think you really did a good job. I am inclined to think you have convinced me that the insurance industry unwittingly has distorted the tort system to the point where people don't care whether they are brought to court. They only care whether their insurance gets canceled. Then insurability becomes a disincentive. What happens if we remove that disincentive and provide no-fault insurance for everybody on any basis? What sup-

plies the disincentive then? Is it socially acceptable to say there need be no disincentive, or is it possible we can modify that dilemma by saying the contract for public indemnity will extend only to the direct consequences and not extend to punitive damages, for instance? What about a provision that you insure against punitive damages?

What if a man had to stand for damages on the punitive side for his actions and couldn't get insurance? Would that supply the economic disincentive?

Mr. RODDIS. Well, it is a very good point. I guess I have two comments on it, taking perhaps the tail one first. That highlights what I think is the question of the molding of driver behavior, the creation of deterrents from socially undesirable conduct.

It seems to me that is not something that should be the province of the civil law and insurance companies anyway. That is something that should be done through the criminal law. Unfortunately I think the criminal law has been led to do a poor job of it, partly because everybody sort of relied upon the civil law insurance mechanisms to do it. That is comment one.

Senator BAKER. If I can interrupt, I agree with you. I think it was probably man's first error in the tort field in that he burdened the tort concept with a social purpose, that is, punitive damages, which was a social purpose, not an indemnity purpose. But we are long past that now.

So what I am saying is let's look at the other fellow's mistakes way back and see if as we modify this system we can't improve on the system that exists.

Senator COOK. Before you all go any further on this, you will admit this distortion occurred because of the field of insurability.

Senator BAKER. Not originally. It occurred in England in the 11th century, when there wasn't any insurance.

Senator COOK. This is the point I have tried to raise with him though. We have made the tort liability and the punitive damages secondary to the degree of insurability.

Senator BAKER. Insurability is the disincentive to negligence.

Senator COOK. To follow through, and I don't mean to interrupt, I think the best example of what you are talking about, this incentive to rely on a program other than the field of insurability, is paramount in the Michigan program. Secretary Austin testified that last year 83,000 motorists applied to the assigned risk pool for coverage, while 260,000 motorists elected to pay into the fund.

We see people who say, when I get my license, I will pay my \$35, because there is no way any major judgment can be collected against me anyway.

Senator BAKER. I want to thank Senator Cook for that, and Mr. Chairman, I want to apologize for taking so much time. It is 20 minutes to 1.

Senator HART. No, we all feel we are extremely fortunate to have the professor here, and incidentally it is a great burden in terms of demand of your time in coming back and forth to Washington.

So far as I am concerned, while we have the dean, let's get that free counsel.

Mr. RODDIS. Could I remark on this other aspect of this problem which you both have highlighted?

In this perhaps I go a little further than Senator Cook. I don't think that the fault concept has much impact on driver behavior under the present system, even assuming there are some consequences to being at fault, if nothing else, you may either lose your insurance or have your rates raised, or even if you in fact bore some part of the liability; for example, I have known people who made serious proposals for deductibles on liability policies, with the statement that if the driver had some of his own dough riding on the front bumper, he might be more careful.

I wouldn't discredit the idea that that has some effect on people's conduct. But my own feeling is that fault liability or the exposure to fault liability, doesn't really have a significant impact on those personality characteristics or those factors of driver behavior that are really at the heart of accident problems. And I think that is suggested by two things.

First, there is one of the subsidies of the DOT study that explores this issue. It is by a sociologist named Dr. Klein, I believe.

And second, in a peculiar way, and it would take too much time to elaborate on this thesis, my theory is really illustrated by what actually goes on in sophisticated insurance ratemaking and underwriting today.

In other words, the fault system concentrates on a highly technical concept of fault. Somebody goes through a red light, or looks aside to straighten a child up while driving and has an accident, or has some other sort of immediately casual technical lapse. That is the reason why I often think a lot of these accidents are very much "there but for the grace of God go I" type situations, no matter how careful I think I am as a driver.

The evidence I think is that the things really at the heart of the serious accident problem are the kinds of causations that go back from these little lapses. They are personality traits, broader behavioral characteristics.

The suggestion would be if you are really going to have an impact on those, you have got to do it through techniques other than raising somebody's rate or canceling his insurance, or even exposing him to some financial liability.

I have always thought myself if a person's own sense of moral conscience doesn't lead him to drive with real regard for the rights and interests of other people, then I can't believe that this kind of contingent pocketbook effect has any big effect. After all, look at the randomness of the things. You can run all of the red lights you want so long as you don't wind up in a crash, as far as the fault liability system is concerned.

Senator BAKER. That is an eloquent argument in favor of the point that the system now is carrying a social component.

Mr. RODDIS. Yes, it is trying to.

Senator BAKER. And in this evaluation, it may be we ought to split out that social component entirely and put it over here in category 2, that is, the causal relationship, if any, between fault and compensation as a deterrent on future negligence.

What I am groping for still is fundamentals, and you have helped me immeasurably in trying to compartmentalize my thinking. What I am aiming toward, I think, without realizing it until now, is a way to preserve the responsiveness and utility of the tort system on a sound

and honest and equitable basis in terms of rate setting and response, to identify those areas where there is a social or moral obligation to respond, and then to decide whether or not we do it in a specialized way by manipulating rates and coverage with the insurance companies or do it in some other way that I haven't fully explored.

For my purposes at this moment, and reserving the right to change my mind, you have convinced me that there is no economic disincentive to negligence, there probably remains only the disincentive of coverage, as Senator Cook points out, whether or not you can get insurance at all, and that means whether or not you can drive a car in most States, and the question of whether we put the social and the legal components of the problem in one package or whether we split them out and deal with them separately.

I really can't go any further than that.

It is quarter to 1 and late and I have used up all my energy, so thank you very much.

Mr. RODDIS. Just to throw out a thought, and I am not a criminal law expert, but you may find food for thought in the public tort fine concept.

It is possible that one reason the criminal law mechanism doesn't work more aggressively is sort of a feeling that you really don't want to expose people to the stigma aspect of criminal treatment. But if you had some concept of a public tort fine, which was essentially payable to a public fund for some useful purpose, you might have a possible avenue.

I have never thought about it in those terms before, you just lead me to do so.

Senator BAKER. If you get that deep into the psychological implications, there is the postulation that one of the reasons we make people respond to damages under the tort system is because we project our own guilt on to them and we derive some benefit from seeing them suffer.

Thank you, Mr. Chairman.

Senator HART. We thank you.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Dean Roddis, as to the point raised by Senator Baker in the assessment of a user tax or assessment to collect the insurance dollars compared to a general treasury approach, the Department of Transportation study suggests that an internalization of the cost through a user tax approach would have a very beneficial effect upon the accident environment by causing direction or attention to be paid to the automobile with respect to its injury severity, and to its property loss reduction characteristics.

Do you agree with the thrust of the Department of Transportation study which suggests that by internalizing the costs—be they for wage replacements or for medical costs, or property damage coverage—you would have a salutary effect on the vehicle population and the accident loss circumstances?

Mr. RODDIS. On principle, yes. Really the only place the question comes up is on this question of whether you make the auto insurance mechanism primary or secondary with reference to the fringe benefit structures both governmental and private.

The only substantial arguments in favor of not fully internalizing would be, one, some of the fringe benefit structures are in a sense more efficient mechanisms now.

I think the New York report adopted a theory of deference to the more efficient system.

And the second point is almost political. You can have quite an effect on the auto insurance premium rate by the decision you make as to the extent to which you internalize. And that certainly is a pressure that shows up certainly in a lot of the State hearings on this question, the need to keep the projected rate levels down. And that has led to the idea of at least deferring to the fringe benefit structure on that question. But in principle I fully agree with the statement you made.

I think that it is wise to internalize the cost to the greatest extent possible to the automobile enterprise itself.

Mr. SUTCLIFFE. And your only caution was that in those areas where an insurance mechanism is already in existence, that may be more efficient, such as—

Mr. RODDIS. Well, it is basically in the medical insurance class, both private fringe benefit and governmental.

Mr. SUTCLIFFE. So you would agree with S. 945 which requires those provisions in an auto policy to be treated as secondary to any other coverages, unless expressly made secondary.

Mr. RODDIS. Yes; you make that choice, yes. You do not fully internalize, in other words, in theory.

Mr. SUTCLIFFE. Let me return to your suggestion for handling a problem that has occupied considerable discussion in these hearings. This relates to the treatment of intangible losses, or general damages, or pain and suffering, whatever label you choose to use.

You have advocated meeting that social problem or community conscience problem of the severe accident, the surgeon who loses a hand, and so on, by increasing, first of all, the first-party coverages to 48 months and a maximum of \$1,500 a month income replacement, coverage of all medical and rehabilitation costs.

What do you do in terms of compensation for the individual who suffers losses beyond that and suffers something such as permanent disfigurement? In other words—

Mr. RODDIS. My proposal left that under the catastrophic harm cause or action.

Mr. SUTCLIFFE. Now you suggested then that the tort mechanism should be preserved above that line for certain general damages or pain and suffering. How do you draw that line above the first-party coverages? And if you draw that line, do you do it on a fault basis; or do you do it on a no-fault basis?

Mr. RODDIS. Well, it is a good question. Let me compare what I think the present bill does with what I thought I was suggesting should be done. Maybe I am wrong on both, I don't know.

Mr. SUTCLIFFE. We would certainly appreciate that.

Mr. RODDIS. It might take a moment.

As I understand your concept of catastrophic harm, you define it as including either temporary or permanent, partial or total disability, with some kind of a concept of 70-percent disability, or disfigurement. Then you have a section that says that in the case of catastrophic harm, you retain the tort action based, as I understand it, on fault, if that is what the State law is, for all damages that would otherwise be recoverable, including economic loss.

Now that would mean——

Mr. SUTCLIFFE. This was including economic loss above what had been paid for on the first-party basis.

Mr. RODDIS. Right; that is just an offset, though. What that means is that suppose I have a high demonstrable earning level, far in excess of the level of insurance carried. If I incur the kind of injury that fits your catastrophic harm definition, then I have a tort action, with admittedly the offset, for my full income loss, whereas somebody who, say, has a lower level of loss, or doesn't fit the catastrophic harm definition, is limited to the prescribed benefit.

I don't see the need for that unless you are trying to get around another problem that is built into the bill, and that is that you didn't think it was possible, apparently, to cope with the concept of earnings loss except as a function of provable earnings.

Now I recognize there are some problems when you start talking about projecting future earnings. But still it is not an impossible task. What I would do is reverse out of both problems in a sense and more closely integrate the direct benefit and the catastrophic harm retained tort liability concept. In effect, what I would do is raise the level of direct benefits, and make them apply to expectable income loss also, subject however to some limitations, and then redefine catastrophic harm. I wouldn't fool around with the 70-percent business or the permanent business. The whole concept of what constitutes permanent and total or partial disability is one of the nightmares of disability insurance litigation.

I would basically define catastrophic harm as the disfigurement cases, if you are really committed to the principle that you have to recognize the right to recover some extra for those, and then I would define all of this concept of permanent disability as simply anything that goes beyond the 48 months. In other words, I wouldn't give a right of action for additional income loss within the 48-month period.

Mr. SUTCLIFFE. What mechanism would you create to prevent malingering to reach that 48-month level, or would you limit the tort action to only continuing wage replacement and medical rehabilitation costs?

Mr. RODDIS. As far as malingering is concerned, I would have the same provision you do, which is what amounts to a coinsurance factor. In fact I would go further, because the bill seems to me it could discourage rehabilitation by limiting the lost earnings factor to earnings lost by disablement from the present or substantially the same occupation.

I think that is sound in itself, but I suggest a further little gimmick that would amend section 2(12)(a), to add a provision reducing net economic loss by an amount equal to only 80 percent of earnings from any substitute occupation. In other words, I wouldn't put a premium on the injured person not accepting rehabilitation that would gear him for some occupation that might be substantially different from what he had done before.

Mr. SUTCLIFFE. What would you do with the housewife as far as compensating her?

Mr. RODDIS. You handled that properly now in another subsection. That is the substitute economic loss problem. That is another problem.

Mr. SUTCLIFFE. You think that is handled satisfactorily in the bill?

Mr. RODDIS. Yes; that is the proper way to handle that. Value the substitute services.

Mr. SUTCLIFFE. Let me pose this question: What is the rationale of utilizing the concept of fault to compensate those people who are disfigured or whose losses exceed that covered under a mandatory first-party coverage?

Mr. RODDIS. Perceived public pressure, I suppose. I told you earlier I am more of a purist.

Mr. SUTCLIFFE. But if there is the perceived public pressure, would that pressure be satisfied on a first-party basis as well as a fault basis?

Mr. RODDIS. You could, and I have made that suggestion from time to time, but it gets artificial. About all you can do is go to a schedule of stated benefits concept; you know, so much for the loss of a finger, so much for a scar on the face. You see what you are facing is the very significant but in a sense emotional argument, usually posed by some horrible hypothetical that can be devised about the beautiful, young woman who is unmarried and gravely scarred in a terrible accident by a reckless, drunken driver. And so her whole life, her psyche for life is impaired and so on. And there is a need for her to be compensated fully and for this offender to be exposed fully to the liability.

Now that is an extreme illustration, you can have others. I think that that is a kind of emotional, maybe others call it better a value judgment, that apparently many people feel very strongly about. And I suppose that you need to provide a remedy in order to accommodate that pressure for retention of the fault liability concept.

Mr. SUTCLIFFE. What if that judgment were placed on a first-party optional coverage basis at the time a person chose the insurance? In other words, not put it on a fault basis, but allow the policyholders for this general damages to undertake some relationship with their insurance company that would compensate them for that particular loss.

Mr. RODDIS. It is a very good thought. It is possible.

Mr. SUTCLIFFE. Thank you very much, dean, for the comments.

Senator HART. Dean, all of us have told you how helpful you have been, and we are very grateful.

Mr. RODDIS. Thank you very much, Senator, I appreciate the opportunity and I enjoyed the discussion very much.

Senator HART. Normally, of course, we would take a recess here for lunch but because of a meeting to which I must go at about 2:30, I would hope we could continue for a period until that time and then we would recess if we haven't concluded to return later in the afternoon. Let me suggest a recess of just 5 minutes.

(Recess.)

Senator HART. The committee will be in order. Next we are fortunate to have as our witness, the president of the Royal-Globe Insurance Cos., Mr. Clay Johnson.

**STATEMENT OF H. CLAY JOHNSON, PRESIDENT, ROYAL-GLOBE  
INSURANCE COS.; ACCOMPANIED BY BILL WALTON**

Mr. JOHNSON. Thank you, Mr. Chairman.

Senator HART. I should add that Mr. Bill Walton is sitting with you, and we would be glad to have comments of course from Mr. Walton.

**Mr. JOHNSON.** I appreciated the opportunity of testifying before this committee, Mr. Chairman.

My name is H. Clay Johnson. I am president of Royal-Globe Insurance Cos., whose headquarters are in New York City. Royal-Globe is a group of 13 stock companies actively writing property and liability insurance in the United States for almost 120 years and automobile insurance for more than 60 years. These companies are licensed and doing business in the 50 States and the District of Columbia with a 1970 premium volume of \$515 million of which automobile insurance comprises \$180 million.

In 1968 I appeared before the Consumer Subcommittee of the Senate Commerce Committee on Senate Joint Resolution 129, authorizing a study of the existing compensation system for motor vehicle accident losses. At that time, our companies endorsed the Department of Transportation study as being necessary not only to clear up the misconceptions that existed concerning the function of automobile insurance but also hopefully to suggest some useful alternative to the present system.

It was heartening to read Secretary Volpe's recent testimony before the House Committee in which he said it was unfortunate that insurers have failed to convey to the public and to their legislative representatives that the auto insurance institution inherited a faulty public policy—one that has vainly attempted the impossible task of molding tort liability and indemnity insurance into a workable and efficient reparations system.

**Senator HARR.** Mr. Johnson, let me interrupt you there, and I suppose I will be charged with having waited until you have reached a thin audience period to make this observation, but it is certainly appropriate. You make the point as did the dean before you that what we are wrestling with here is the system. It is not somebody with a black hat that got the wires crossed. It is an evolutionary process, which as with all human institutions didn't evolve very perfectly.

And we are now trying to see how we can improve it. In the nature of congressional hearings, the impression is inescapable that there must be somebody who is bad. Simply stating that that is not necessarily so is not going to relieve the sting. I know. But I feel obliged to put on the record that this isn't the problem; it is an accumulation of decades of unwise development.

**Mr. JOHNSON.** Thank you, Senator, we appreciate that. We know that we are generally misunderstood by the public. We are a beleaguered business, particularly just now.

You yourself have mentioned the identity crisis that everybody seems to be suffering from. I am the first to confess that our business is suffering from an identity crisis and what I was saying in quoting Secretary Volpe in part is merely trying to recognize, as he put it, that most of the current auto insurance spring from defeats in the tort reparations system rather than defects in the insurance institutions themselves.

But I don't hold the insurance companies in the present situation. For many years we remained aloof from the reparations problem on the theory that the legislators and the courts shape the legal destiny and we merely deal with the consequences. Lately, however, our business has come to realize that since we possess a certain expertise in

this area we have a responsibility to try to rectify the shortcomings of the present reparations system. I might say the same should apply to the legal profession. While individual lawyers are not responsible for what the law is—any more than a meteorologist is responsible for the weather—the members of any profession have an obligation to contribute to the solution of social problems falling within their sphere of activity.

Because I recognize such responsibility for our business, I am pleased to testify before your committee. In doing so I am stating the sincere views of myself and my companies and not those of any trade association since we belong to none.

Nor do we, in the words of Secretary Volpe, assume the role of advocates for whatever cause seems best suited to enhance or preserve our market position since we are not one of the largest writers of automobile insurance. We are merely writers of general property and liability business, which consists in substantial part of automobile insurance, and as such we recognize the inadequacies of the present reparations system and wish to see it changed to one which will better serve the public interest.

It would answer no useful purpose for me to deal at length with the deficiencies of the present fault system. In general, we agree with Secretary Volpe and others that the basic problems of the present system lie in the underpayment for those seriously injured or killed, the overpayment to the minimally injured and the wasteful administrative costs of the system. We also share his confidence that by changing the reparations system to first-party no-fault insurance, the major problems will be eliminated since they are primarily due to the cost and difficulties involved in adversary proceedings which will be largely dispensed with. We agree also that many other advantages will flow from a no-fault system, included among which are the following:

- Greater accuracy in rating first-party insureds because of their knowable characteristics as distinguished from the unknowable characteristics of third-party plaintiffs;

- Greater rate recognition of the protective qualities of the insured's own motor vehicle;

- Potential rate savings for low-income insureds because of recognition of their lower loss exposure as compared with high-income insureds, correlating rates more nearly with ability to pay;

- Added economic stimulus for enforcement of traffic safety laws;

- Reduction of market problems involving unavailability of insurance and policy cancellation and nonrenewal;

- Elimination of spurious claims by making each first-party claimant submit proof of economic loss;

- Reduction of inequities flowing from the contributory negligence rule as well as the vagaries of jury verdicts; and

- Reduction of the number of cases requiring legal representation and contingent fee arrangements with consequent savings in settlement time, litigation expense, and cost to taxpayers of the court system.

From an insurance company standpoint, the principal benefit of a no-fault system is elimination of the enormous cost of investigating, settling, and litigating third-party claims, the substantial savings expected to be realized in this area being the principal source of expected reductions in premium cost.

To achieve this, however, it is necessary that the no-fault system goes a considerable distance and not just a small part of the way as it does in Massachusetts. Any substantial retention of third-party liability or subrogation rights will, in our opinion, result in increased claims-handling costs and thereby retard the expected reduction in premium rates. However, we believe some statutory dollar limit on no-fault recovery is necessary in order to assist in the rating process by avoiding exposure to unlimited contractual claims for economic loss.

On balance, therefore, we would look with favor on the \$30,000 limit proposed in S. 945 since it would encompass the great majority of claims and thus obviate the necessity of incurring investigative and litigation expense but would still impose a limit and thus enable risks to be accurately rated.

In this same connection we recognize that where a dollar limit is imposed on no-fault recovery some provision must be made on a third-party basis for claims which exceed the limit as well as for meritorious claims for permanent injury and that this requires some definition of allowable third-party claims. However, we believe that catastrophic harm as that phrase is used in section 2(9) of Senate bill 945 is so ambiguous that it would be counterproductive and would require insurers to incur sizable and perhaps unnecessary investigative costs to prepare for the possibility of tort actions. We would suggest, therefore, that the definition of catastrophic harm be revised to include more precise standards.

Senator HART. If you could help us with that language, we would welcome suggestions.

Mr. JOHNSON. Thank you. I listened to the suggestions of Professor Roddis on this point, and while we would still like to study the cost aspects, I think I could say in principle I agree with most of his suggestions.

One other objection we have to S. 945 is that it would place automobile insurance in a secondary position to other collateral sources of recovery. We believe that under any no-fault system automobile insurance should be the primary source of indemnification for accident victims since such requires the motoring public to bear the costs of its own insurance.

This I believe was referred to earlier as internalization. If insurance coverage is made secondary to other collateral sources such as Blue Cross, medicare, medicaid, or social security, a large element of indirect subsidy would be created for automobile insurance and many of the expected benefits of a no-fault system would become obliterated. Moreover, the problem of rating no-fault automobile insurance would be immensely complicated if underwriters are required to consider the presence or absence of other collateral sources, and it would also remove a major source of expected savings.

Next, we would suggest that S. 945 be expanded to require property damage claims, other than those involving motor vehicles to be settled on a first-party basis by making the claimant an additional assured for this purpose. We also think there should be attached to that some limit, say \$1 million. This again would avoid the expense of investigation and litigation of property damage claims which might otherwise frustrate the main objective of no-fault to achieve premium reductions. Property damage claims involving motor vehicles should be prohibited on a third-party basis since car insurance will be compulsory and each

this area we have a responsibility to try to rectify the shortcomings of the present reparations system. I might say the same should apply to the legal profession. While individual lawyers are not responsible for what the law is—any more than a meteorologist is responsible for the weather—the members of any profession have an obligation to contribute to the solution of social problems falling within their sphere of activity.

Because I recognize such responsibility for our business, I am pleased to testify before your committee. In doing so I am stating the sincere views of myself and my companies and not those of any trade association since we belong to none.

Nor do we, in the words of Secretary Volpe, assume the role of advocates for whatever cause seems best suited to enhance or preserve our market position since we are not one of the largest writers of automobile insurance. We are merely writers of general property and liability business, which consists in substantial part of automobile insurance, and as such we recognize the inadequacies of the present reparations system and wish to see it changed to one which will better serve the public interest.

It would answer no useful purpose for me to deal at length with the deficiencies of the present fault system. In general, we agree with Secretary Volpe and others that the basic problems of the present system lie in the underpayment for those seriously injured or killed, the overpayment to the minimally injured and the wasteful administrative costs of the system. We also share his confidence that by changing the reparations system to first-party no-fault insurance, the major problems will be eliminated since they are primarily due to the cost and difficulties involved in adversary proceedings which will be largely dispensed with. We agree also that many other advantages will flow from a no-fault system, included among which are the following:

- Greater accuracy in rating first-party insureds because of their knowable characteristics as distinguished from the unknowable characteristics of third-party plaintiffs;

- Greater rate recognition of the protective qualities of the insured's own motor vehicle;

- Potential rate savings for low-income insureds because of recognition of their lower loss exposure as compared with high-income insureds, correlating rates more nearly with ability to pay;

- Added economic stimulus for enforcement of traffic safety laws;

- Reduction of market problems involving unavailability of insurance and policy cancellation and nonrenewal;

- Elimination of spurious claims by making each first-party claimant submit proof of economic loss;

- Reduction of inequities flowing from the contributory negligence rule as well as the vagaries of jury verdicts; and

- Reduction of the number of cases requiring legal representation and contingent fee arrangements with consequent savings in settlement time, litigation expense, and cost to taxpayers of the court system.

From an insurance company standpoint, the principal benefit of a no-fault system is elimination of the enormous cost of investigating, settling, and litigating third-party claims, the substantial savings expected to be realized in this area being the principal source of expected reductions in premium cost.

To achieve this, however, it is necessary that the no-fault system goes a considerable distance and not just a small part of the way as it does in Massachusetts. Any substantial retention of third-party liability or subrogation rights will, in our opinion, result in increased claims-handling costs and thereby retard the expected reduction in premium rates. However, we believe some statutory dollar limit on no-fault recovery is necessary in order to assist in the rating process by avoiding exposure to unlimited contractual claims for economic loss.

On balance, therefore, we would look with favor on the \$30,000 limit proposed in S. 945 since it would encompass the great majority of claims and thus obviate the necessity of incurring investigative and litigation expense but would still impose a limit and thus enable risks to be accurately rated.

In this same connection we recognize that where a dollar limit is imposed on no-fault recovery some provision must be made on a third-party basis for claims which exceed the limit as well as for meritorious claims for permanent injury and that this requires some definition of allowable third-party claims. However, we believe that catastrophic harm as that phrase is used in section 2(9) of Senate bill 945 is so ambiguous that it would be counterproductive and would require insurers to incur sizable and perhaps unnecessary investigative costs to prepare for the possibility of tort actions. We would suggest, therefore, that the definition of catastrophic harm be revised to include more precise standards.

Senator HART. If you could help us with that language, we would welcome suggestions.

Mr. JOHNSON. Thank you. I listened to the suggestions of Professor Roddis on this point, and while we would still like to study the cost aspects, I think I could say in principle I agree with most of his suggestions.

One other objection we have to S. 945 is that it would place automobile insurance in a secondary position to other collateral sources of recovery. We believe that under any no-fault system automobile insurance should be the primary source of indemnification for accident victims since such requires the motoring public to bear the costs of its own insurance.

This I believe was referred to earlier as internalization. If insurance coverage is made secondary to other collateral sources such as Blue Cross, medicare, medicaid, or social security, a large element of indirect subsidy would be created for automobile insurance and many of the expected benefits of a no-fault system would become obliterated. Moreover, the problem of rating no-fault automobile insurance would be immensely complicated if underwriters are required to consider the presence or absence of other collateral sources, and it would also remove a major source of expected savings.

Next, we would suggest that S. 945 be expanded to require property damage claims, other than those involving motor vehicles to be settled on a first-party basis by making the claimant an additional assured for this purpose. We also think there should be attached to that some limit, say \$1 million. This again would avoid the expense of investigation and litigation of property damage claims which might otherwise frustrate the main objective of no-fault to achieve premium reductions. Property damage claims involving motor vehicles should be prohibited on a third-party basis since car insurance will be compulsory and each

car owner will have the opportunity to purchase automobile physical damage insurance, with suitable deductibles, for his own protection.

Finally, while we have some reservations from a practical standpoint about the formula in S. 945 for the handling of claims involving commercial vehicles, we are uncertain of what to suggest in its place. Obviously, the desire is to avoid the extremes of imposing absolute liability which would seem too onerous, or equating the commercial with the personal car owner on a no-fault basis which would seem unduly favorable, or retaining tort liability which would frustrate the purpose of a no-fault scheme. While equitable sharing of cost is difficult to formulate we would seek a middle ground as S. 945 has attempted to do.

Secretary Volpe has mentioned the remarkable degree of consensus on a no-fault solution to the auto accident reparations problem and has said that immediate reform is demanded, the sole remaining issue being whether reform should take place at the State or Federal level. In his testimony he initially seemed to assume that reform at the Federal level would have to consist of actual Federal regulation of the automobile insurance business. We do not agree that such regulation by the Federal Government is either necessary or desirable for the purpose of achieving the intended result and we were glad to see that in the colloquy which followed his testimony before the House committee, the Secretary said that if a proposal for the imposition of minimum Federal standards could be worked out without a takeover by the Federal Government of insurance regulation from the States, he would not object.

Since automobile insurance is only one form of business written by property and liability companies it would in our view make no sense to have the Federal Government regulate automobile insurance alone and leave to the States the regulation of the remainder. The comprehensive system of State regulation now in existence which ranges all the way from the examinations for solvency to the approval of rates, rating practices, and policy forms, as well as the licensing of both carriers and producers, is one fabric and cannot be effectively split so as to apply to automobile insurance alone. Therefore, we favor the retention of State regulation of insurance generally, including the regulation of automobile insurance.

I might interpolate there, Mr. Chairman, that I am known in this business as one who does not look with disfavor upon Federal regulation. A few years ago I believe I was the first to say that I thought that was inevitable, and that we ought to prepare for it. So in saying this about retention of State regulation, it is merely a matter of proposing something that is orderly against something that we fear would be disorderly.

However, we also favor a mandate at the Federal level for the adoption by the several States of a no-fault reparations system since we feel desired uniformity and speed of action will be achieved in no other manner. In our view, if the States are allowed to exercise their own volition in adopting no-fault legislation, the job will never get done or, even worse, it will be done in a manner producing a crazy quilt of State laws which will only serve to compound present problems.

There seems little question concerning the power of the Congress to legislate the abolition of tort liability as applied to automobile insurance countrywide. The power of Congress over interstate commerce is plenary under the Constitution and if there were any lingering doubt about intrastate limitations that seems to have been removed by the recent U.S. Supreme Court decision in the *Perez* case dealing with the anti-loan-sharking provisions of the 1968 Consumer Protection Act. There the Court held that Congress can constitutionally find that a certain class of activities is inherently tied in with interstate commerce and it need not leave to the courts a determination that particular intrastate activities have a prohibited effect. Therefore, Congress could make a legitimate finding that automobile traffic is inherently tied in with interstate commerce and thereupon legislate the abolition of tort liability as applied thereto and the substitution of a new first-party no-fault system of automobile insurance reparations.

There is ample precedent for the plenary power of Congress being exercised in the interstate commerce field either directly by Federal regulation or indirectly by inducing State action. We would suggest that Congress permit State action but prescribe fixed standards for it. In other words, we believe Congress should adopt a model bill for State enactment which would limit tort liability as applied to automobile accidents and substitute therefor a first-party, no-fault system of insurance.

We also believe each State should be allowed 3 years—there's no magic about that, it could be shorter—3 years in which to act, failing which the Federal law would become effective in that State (the latter could overcome any State constitutional obstacle which may exist). Additionally, Congress might induce earlier State action by use of its control of highway funds. Our suggestion would, of course, preserve to the several States the actual regulation of the new automobile insurance system.

In our view the plea that States should be allowed time and opportunity for experimentation in the field of automobile accident reparations completely ignores the urgency of the present situation which, as mentioned above, Secretary Volpe himself has said demands immediate reform. Furthermore, we think it is equally unwise to suggest a pattern of diverse State legislation which would subject an insured motorist to varying degrees of reparations treatment depending on the State in which the accident occurred.

If there is anything which cries out for uniformity countrywide, certainly it is the subject of auto accident reparations, not only to assure an uncomplicated national solution to existing problems but also to simplify the coverage of motorists who customarily drive their automobiles from State to State. Since no-fault coverage is intended to be contractual in nature and not dependent upon the law of the State where the accident occurs, it is important to have all State laws uniformly conducive to that objective in order to maximize its benefits.

As in many situations, it seems that the difficulty most people have about a forced solution to the automobile reparations problem is to find a proper rationale for it. I suggest that this rationale springs readily from the concept that in this day and age the automobile is not just a piece of private property but an essential means of trans-

portation upon which our social and economic structure is vitally dependent. One only has to drive through the countryside and see factories, laboratories, and other places of business surrounded by huge parking lots full of employee-owned cars to realize how essential automobile transportation is to our economy and why it is foolish to consider any longer that it is some form of luxury. Thus, when one uses his car for essential transportation to and from work or in other ways which bear upon his daily existence, he is little different from one who elects to use a common carrier as a means of transportation.

For many years the courts have recognized the essentiality of the latter and have allowed passenger accident victims of common carriers to recover under a doctrine of strict liability. I suggest that a no-fault reparations system for automobile accident victims closely follows the same reasoning since it results in recovery of the victim's economic loss under all circumstances and restores him to a self-sustaining economic position.

What is thought to be socially desirable in one case should be equally so in the other. The workmen's compensation laws which were enacted in the several States many years ago adopted such a view in substituting first-party, no-fault recovery by the employee under an insurance scheme for third-party liability recovery against the employer. It is time that our society adopted such a view of automobile transportation.

I say all of this with complete recognition that insurance is an essential public service and that its only justification is its usefulness to the public. The legal profession is also engaged in a public service and its usefulness is likewise gaged by how it devotes its talents and energies to the public's good. It behooves both our insurance industry and the legal profession to work together to improve their services to the public. I think this can best be accomplished by having the Congress legislate in the manner I have described.

Mr. Chairman, I have some supplemental remarks about the other legislation that is before your committee. I can give that later and pause now for any questions concerning S. 945, or I can proceed, as you wish.

Senator HART. All right. When I say I appreciate having your testimony, it would be expected of me to say that, in general, it conforms with what I think we should do. But speaking from the background of the insurance business as you have, I hope you will be very persuasive with Congress to see if we can move promptly to make the corrections in the system which you put your finger on.

I would underscore only one point, and that is the fact that as you said:

Secretary Volpe has mentioned the remarkable degree of consensus on the no-fault solution to the auto accident reparations problem and has said that immediate reform is demanded, the sole remaining issue being whether reform should take place at the state or federal level.

Until the very recent past, you could hardly get away with saying that there was that consensus. But I think now we should recognize that there is.

Mr. JOHNSON. I wanted to identify with the group insurance concept as well, because I assume you are interested in the insurance companies' point of view on that.

Senator HART. We are.

Mr. JOHNSON. We are not opposed—meaning myself and my companies—in principle to S. 946, which has for its principal purpose the elimination of State prohibitions and obstacles preventing the writing of group automobile insurance since we favor maximum flexibility in the marketing and pricing of insurance. Our companies have, in fact, been in the vanguard as to “mass merchandising” of personal lines insurance and we would prefer to be free to adopt new rating techniques in this area.

However, I would not wish to leave with this committee the impression that artificial statutory and regulatory restraints at the State level are the only impediment to the writing of true group auto coverage. The essential ingredients for true group coverage are the homogeneity of the group and the statistical credibility of the group experience. Because automobile rates customarily take into consideration the experience differentials applied to geographical areas as well as the age, driving habits and other characteristics of the named insured, it has been found difficult to develop a true group approach to the writing of automobile insurance even in those States where presently permitted.

It is to be expected, however, that given the opportunity, the insurance business would experiment with various new techniques in this direction and would in all probability develop modified group plans permitting the use of average rates while at the same time taking into consideration geographical areas and individual risk characteristics.

Since my statement with respect to no-fault automobile insurance advocated Federal legislation for the purpose of achieving uniformity of approach by the several State, I cannot consistently deny support for Federal legislation which would achieve a desirable degree of uniformity in the field of group automobile coverage as well.

On S. 976, I merely wanted to say that this is a bill to amend the existing National Traffic and Motor Vehicle Safety Act and we as insurance companies are not directly involved in this since it pertains only to safety standards applying to the manufacture of motor vehicles. Insurance companies are affected only to the extent that the Department of Transportation is required to make information with respect to the testing of the damageability of cars available to them for use in determining premium rates for automobile insurance; and, of course, the related provision requiring a report to the President and Congress on the extent to which our industry is utilizing such information in the determination of insurance rates also implies some monitoring of our performance in this respect.

Since there is in the bill no direct regulation of the insurance business this question is not presented. Our companies, are, of course, deeply interested in the subject of damageability of automobiles and consequential injuries to the occupants thereof. Some years ago, we, along with other automobile carriers of all types, founded the Insurance Institute for Highway Safety now headed by Dr. Haddon and, as your committee knows, the institute has lately been conducting very pervasive studies in this field which have evoked wide public comment, particularly its film showing the actual damage incurred by various makes and models of cars at low speeds.

In fact, our companies were a cosponsor of a symposium on this subject held by the Institute last year. Quite naturally therefore, we would welcome any impetus which the Federal Government can give toward the reduction of the damageability of automobiles and injuries to their occupants. Moreover, we would welcome the availability of information which would assist us in reflecting in our rates the known degrees of damageability, et cetera.

I am sure, however, that this committee appreciates the difficulty of any firm projections of rate reductions which might be made possible by use of such information. This difficulty stems not only from the fact that damage to cars and their occupants occurs at varying speeds, only the lower of which are susceptible of measurement, but also from the fact that the frequency and severity of car accidents is attributable to many other factors not the least of which are the enactment and enforcement of traffic safety laws, driver licensing, individual driving habits and highway construction.

Nevertheless I am certain that if scientific information of the type contemplated by S. 976 is made available to our industry, it will be put to good use in our rating techniques.

Just in conclusion, Mr. Chairman, I want again to thank the committee for the opportunity to appear. I want to express our gratitude for the committee's interest in the subject of automobile insurance. Your sponsorship of the National Traffic and Motor Vehicle Safety Act in 1966 and the subsequent authorization of the 2-year study by the Department of Transportation of the no-fault insurance subject has been most welcome as far as my companies are concerned. We feel that only in this manner has needed public attention been given to an area which has been perplexing our industry all through the sixties.

Your committee knows of the billions of dollars of loss we have incurred trying to keep pace with the toll of highway accidents which was made worse by the constant impact of inflation. We agree with you, Senator Hart, as to our—what I mentioned earlier—identity crisis. We find ourselves issuing a policy to cover potential tort liability, but the public looks upon it as a source of compensation only. Your committee has put the spotlight on this dilemma and we are grateful for that.

And we sincerely hope that these hearings will culminate in useful legislation along the line I have described. Thank you.

Senator HART. Thank you.

I repeat, your testimony with respect to the several bills is most welcome. And I think the role that you and others in the insurance field have played in funding that insurance institute to which you referred, the Insurance Institute for Highway Safety, has been an important contributor toward lifting the sights for everybody.

I have seen those films and I understand they are being shown just as widely as the distributors can persuade the exhibitors to get them in line. Although I would doubt you would win any Emmies in Detroit for the film, in the long run everybody will be the better for it Mr. Sutcliffe.

Mr. SUTCLIFFE. Thank you, Senator Hart.

Mr. Johnson, so that we can understand your proposal for a Federal model bill better, by a model bill, do you mean one that sets down certain requirements, for example, one that sets down requirements as those in S. 945?

Mr. JOHNSON. And that, as to those requirements, does not permit variation by the State legislatures. That is what I mean, an exact pattern for State enactment.

Mr. SUTCLIFFE. Then as to the point Senator Cook has discussed about allowing the States to go beyond in requiring mandatory coverages, you would suggest that the bill allow—the model bill and the legislation passed establishing the model bill allow this kind of activity?

Mr. JOHNSON. No, I was suggesting the opposite, as a matter of fact. I think that the mandate at the Federal level and the compliance there with it at the State level should be identical. I don't think that the States should be in the position to enact anything less or anything more—the reason being that if that were possible, you would develop this thing I abhor—a diverse system which becomes a hodgepodge countrywide and makes it almost impossible for administration by the insurance companies. Naturally I am thinking of our job of trying to rate a driver who is likely to drive his car any moment into another State where the law and exposure could be different. And I just think that one way to avoid this and to provide a common denominator for coverage is by having a federal pattern that must be adhered to.

Mr. SUTCLIFFE. You argue for motor vehicle property damage liability to be abolished in favor of the option on the policyholder to insure or not insure his car against collision?

Mr. JOHNSON. Yes.

Mr. SUTCLIFFE. And you would have that made a part of the model bill?

Mr. JOHNSON. Yes. I think you have to legislatively rule out tort liability as regards property damage in order to permit the companies not to be concerned about that exposure when they issue a policy. As you probably know, the property damage claims have been tied very directly to bodily injury claims—not only because they arise out of the same accident, but because in very many cases the bodily injury claim is merely a means of trying to induce a more generous settlement on the property damage claim. So you can't divorce these two, in our judgment. You have to look at them together. If property damage claims were left under the tort liability system, we think that a lot of the savings and advantages sought to be achieved by no-fault insurance will be lost.

Therefore, we think that vehicular property damage claims should be rid of any tort liability, the same as the bodily injury claim. That leaves us only with the nonvehicular property damage claims—how to deal with those?

Obviously if you rule out tort liability on that, then you are in a position where you are dealing not with your own insured as to something he owns, but you are dealing with a third party as to some property that has been damaged, and that isn't manageable in the same way. You can't say, well, let's let him insure that, because your opportunity to provide coverage for him doesn't arise in the same manner. So we think there should be some preserved area of tort liability recovery there.

Mr. SUTCLIFFE. What about general damages or pain and suffering in certain specified cases? Can you insure that on a first-party basis?

Mr. JOHNSON. Well, we do in effect with medical payments coverage under the present automobile insurance.

Mr. SUTCLIFFE. I am talking about the intangible loss, the general damages, pain and suffering, what a jury awards on the basis of community conscience to an individual for severe harm to help make him feel whole or feel compensated for that loss.

Mr. JOHNSON. My testimony recognized that there should be an area of recovery, tort liability recovery, over and above the rather high threshold provided, which I approve of, in your bill, so as to permit recovery first for permanent and total disability, where the economic loss exceeded that amount, and second, for dignitary damages, shall we say, where the nature of the injury was such as to deserve compensation in a manner that cannot be recognized under the economic loss test.

Now, just how that should be defined, as I said, is extremely difficult. I do not think it is enough to just call it catastrophic harm, and we would like to see a more precise definition of that.

I heard the colloquy this morning, in reference to Professor Roddis, and all I would say is that in the hypothetical case of the young lady who was disfigured, she is not compensated now unless she is lucky enough to be run into by an owner who has high limits coverage. I do not say that is right; I am just saying it is a fact.

This is an imperfect world, and if we are merely trying to create a better system than the present one, then you have got to measure it in terms of the present system. You cannot measure it in terms of the ideal. I suppose the ideal is that everybody would recover what was due him under every conceivable type of situation. But then you look at the present law and say, what is now recovered? Well, sometimes recovery is made in that type of disfigurement case for dignitary damages which go to a very high figure, but from a practical standpoint only where there is insurance. And certainly if this indigent drunken driver mentioned this morning runs into this lovely lady, she is not going to recover anything but the basic limits.

Mr. SUTCLIFFE. So, in other words, we are assigning those damages not on the basis of the fact of the person who caused the damage, but on the basis of his economic stature or liability coverage?

Mr. JOHNSON. We are now, yes. It is not intended to work that way, but it does.

Mr. SUTCLIFFE. That is a very cogent point.

Mr. JOHNSON. It is not intended that way, but this is the realistic picture.

Mr. SUTCLIFFE. Let me ask why, if you are proposing a model bill be enacted by Congress that permits no deviation, that you suggest a 3-year time delay for the States to enact that model? Is it for very practical reasons in the insurance industry? Is it for the purpose of allowing the States to be involved in the process? What is the rationale for the 3-year delay in enacting the model bill?

Mr. JOHNSON. I think it is a combination of all of those. I said there was nothing magic about the 3 years, and I would prefer to see a shorter time. First, let me say the only reason I suggest an opportunity for States to enact this legislation rather than have it done by Federal fiat is merely out of recognition of what seems to be popular today in Washington, and that is the concept of dual federalism. There seems to be in both parties a desire to let legislation be as close to the people as possible, as has been said, and to recognize States' rights whenever

possible and to enable States to administer programs to the extent that is possible.

Now, my proposal is merely out of recognition of that, among other things. Also out of recognition of the fact that the States are not strangers to this field; they have been in this field of regulating automobile insurance for many years, and it just seems appropriate to let them stay in the act so to speak to the extent that is possible, even though you force the type of action they can take.

Thirdly, the idea of the time element was to enable those States which are more advanced in their thinking on this to go ahead and get the thing started without waiting for the Federal law to take effect. Where would that be? Well, it might be New York, for example, where the insurance department and the governor have endorsed no-fault legislation—and there is a Republican legislature there, and whether it will be done this year or not I do not know, but at least the circumstances are more conducive there than in another State. If New York wanted to go ahead, I would think that would be better than having the effectiveness of a Federal law held back for the requisite period for people to get ready.

Also Massachusetts, which already has a modified no-fault law, might see fit to broaden theirs and go into a deeper area. And there are other States I could mention as well where the no-fault concept seems to have pretty well taken hold.

I think that this piecemeal approach is all right as long as it conformed to a uniform pattern and is not hodgepodge, as I say; I see nothing wrong with the progressive achievement of that objective. From our industry's standpoint I see some advantage too—although this I put in a secondary position—some advantage in acquiring some progressive experience. But I realize when I say that I am a little inconsistent, because I have already said that I think we ought to have nationwide uniformity, and if you asked me which I would rather have, the progressive experience or nationwide instant uniformity, I would have to say the latter.

Mr. SUTCLIFFE. But your comments go to training of people?

Mr. JOHNSON. Yes.

Mr. SUTCLIFFE. Training techniques?

Mr. JOHNSON. We have a vast array of people—our companies and other large writers of automobile insurance—in our claims department who mainly are engaged in the investigation and settlement of tort liability automobile claims. If those forces are going to be re-deployed to a different type of work, naturally I think it might be helpful to have an interim period in which to arrange that. Mind you, I think it could be done, I am not making it an insurmountable obstacle.

Also we have the rating techniques. This is a new ballgame. If we get to no-fault the rating of risks is on an entirely different basis than ever before. And there will be an absence of statistics as well. True, we have statistics now as to frequency and severity of car accidents, but we do not have those related to the first-party insured in the sense of his economic situation.

So obviously under a no-fault system you will be considering how much it is going to cost to put that insured together again if he gets into an accident, how much his medical expense will be, how much the loss of income is in his case. As it is now we are considering an un-

known third party whom we are going to put together in the event of an accident. Now we will be looking at the fellow we are insuring and we are going to have to rate him.

Mr. SUTCLIFFE. You mention it will be a new ballgame and one that will not have a statistical basis, but nonetheless it is one you think is worth playing.

Mr. JOHNSON. Yes, oh, yes, we are all for it. We just do not want to understate the difficulties of the transition, that is all.

Mr. SUTCLIFFE. As to the problem that Dean Roddis mentioned earlier this morning of mandatory writing of insurance policies on application, you argued for the retention of State regulation. Question one would be, would that include all aspects of rate regulation? Question two would be, if there is an affirmative answer to the first question, what is your position on mandatory writing? And if your position is affirmative as to mandatory writing, what do you do with the argument that Dean Roddis presents that this would increase the selectivity, the selective underwriting practices in the United States today?

Mr. JOHNSON. You are correct in saying that by recommending the continued state regulation of insurance I was impliedly saying that I did not favor this Federal regulation of insurance that is in S. 945 as regards the compulsory writing of insurance and the nationwide prescription of the type of policy and the breadth of coverage. You are right in inferring that I am in favor of the continuance in the several States of the present system of regulating rates and forms of coverage. By that I do not mean they should be frozen into any position, because our companies favor open rating and we have been strong advocates of opening rating.

So we would hope that all States eventually will get to no-prior-approval rating laws. But until they do we will be satisfied even to submit to prior approval rating laws in preference to a Federal system of regulation that is superimposed on top of present State regulation.

As I identified myself earlier, I have not been an opponent of Federal regulation of insurance as such. But I think our last position could be far worse than our first if we ever got under a dual system or regulation. I certainly do not want to see the insurance companies put in the position of the railroads in the United States, which is one of the things they have suffered from in my opinion. I would far rather be in a position of a national bank which is under the Comptroller of the Currency's regulation or an airline under the CAB. But to be under a dual system of regulation I think would be impossible. Particularly it would be impossible if the Federal Government, which is prescribing the mandatory coverage, is doing so without any control over rates and presumably without any real interest in the ability of the companies to write the mandatory coverage within the rate structure established in the various States.

I have always said that in this business of insurance you should have one extreme or the other: you should have the same rate fixed for all companies for a given coverage by a public authority, State or Federal, and let the companies compete as to their service and in other aspects; or companies should be able to compete ratewise as well as servicewise. But you cannot have it both ways—and in the first instance, if you have the rate established so it is the same for everybody, then there might be some justification for making coverage

mandatory, the same as is done with a public utility which has to render service.

But where you have a competitive business such as ours—and there is no business you can think of where competition is more rife than it is in insurance—with companies competing for mere survival, to be told that they have to write coverage for anyone and everyone without any choice and at a price which, let's face it, is not within their control in many States because of the political interferences with rate approvals, this creates an impossible situation because there is no escape valve.

And you cannot ignore capital incentive—after all, whatever one thinks about the private insurance business it is here, it is something that has existed for a long time. Behind the premiums there is a considerable amount of capital; it may not sound like much compared with the trillion dollar GNP we talk about today, but it is still a lot of money. And the capital will not stay there, the goose will be killed that lays that golden egg if the companies are not able to see their way clear to making a profit on the business they write.

Mr. STUTCLIFFE. Right now the Department of Transportation informs us that 15 to 20 percent of the drivers in this country are operating their vehicles without liability insurance coverage. One of the reasons for this is lack of availability, the economic inability to participate in either assigned risk programs covering liability or high risk companies covering liability and other insurance.

One, do you think the availability problem would be solved if we had mandatory no-fault? And two, hypothetically, if it is not solved, do you think there is a basic inconsistency with your desire to maintain State regulation and the creation of a Federal corporation, as suggested by Dean Roddis, for the providing of insurance coverages at a rate that people can afford for picking up that driver who cannot obtain insurance on the voluntary market?

Mr. JOHNSON. Taking the first question first, I do believe that a mandatory, nationwide, uniform limited no-fault system of the type I described, would cure the market problem for automobile insurance and would go a long way toward curing the problem of availability of insurance coverage. Now, I do not say this in a critical sense, but one of my troubles with S. 945 is that I think it displays little faith in the no-fault mechanism because it does not trust that to provide a cure for the marketability problem and the availability of insurance but it goes on to make it mandatory that coverage be made available and so on. I think if one really believes in no-fault as a near panacea for the problems of availability of insurance, cancellation, nonrenewals, and the like, then he ought to give it a test. But it is never going to be tested if it is done in an atmosphere where mandatory writing of coverage is in effect. You will never know whether no-fault is good or bad.

But answering your second question, if it should fail, then I concede that some remedy would have to be found, and on that remedy I do not disagree with Professor Roddis; I think our business is always in the position where if it does not provide coverage it cannot complain if the Federal Government steps in and fills that vacuum.

This is a position we have taken on crime insurance. We think crime insurance of the type that the Federal Government seems to

want written is not insurance at all; it is really a subsidy offered to merchants in an area where that type of insurance cannot really be written. And we say that if that subsidy is going to be provided it should be provided by the government, not by the insurance business, because it is not really insurance.

I would say that about automobile insurance. If it ever gets to the point where no-fault was given a good try and there was a hard core of drivers who could not get insurance because of the neighborhoods in which they lived and accident proneness or some other situation, if this became a social problem and coverage is still considered socially desirable in order to give them economic means of transportation, then I think certainly it should be done by the government.

I do not think we should complain then, but I think we ought to be given a chance first.

**Mr. SUTCLIFFE.** What about the provisions prohibiting cancellation or nonrenewal except in certain specified situations? Do you support that?

**Mr. JOHNSON.** We have supported—I mean most companies of every type have supported—the noncancellation statutes in the various States which in effect say that once a policy is written, after a certain period of time it cannot be canceled during the term. Nonrenewal up until now has not taken that extreme form—the most that is required is that the insured be given appropriate notice of intention not to renew. This is because, up until recently anyway, insurance companies have thought this to be an essential part of their underwriting prerogatives. It goes back to what I was saying earlier. If you consider insurance private enterprise, and if you consider it a competitive business, then you have got to concede the underwriting prerogative—the decision as to whether a company is going to continue a risk on its books.

**Mr. SUTCLIFFE.** Is it based on the inability of the rating structure to respond to eligibility for classification?

**Mr. JOHNSON.** That is right.

**Mr. SUTCLIFFE.** So because nonrenewal has not taken that course it is really a reflection of the present state insurance regulatory mechanism?

**Mr. JOHNSON.** Yes, but S. 945 does not cure that inability and it will never be cured short of some kind of a rate that is high enough to encompass all types of risks. And this I cannot see happening.

**Mr. SUTCLIFFE.** Thank you very much.

**Senator HART.** Is there anything you would like to add?

**Mr. WALTON.** No, thank you, Senator Hart.

**Senator HART.** Mr. Johnson, all of your testimony has been good. Several of your answers I think will help us better understand and better evaluate the proposal for no-fault we are considering. Particularly that answer which reminded us to test what in fact happens now before you reject the proposed no-fault because it too is not perfect. The question really that this committee should compel itself to answer is, will on balance this no-fault proposal improve existing situations? There is one answer you gave that states that much more effectively than I.

**Mr. JOHNSON.** Thank you, sir.

**Senator HART.** We will recess at this time and resume at 4 o'clock. (Recess.)

Senator HART. The committee will be in order.

As we resume, we will receive testimony from several people, but may I recognize first the president of the National Association of Independent Insurers, Mr. Vestal Lemmon.

Mr. Lemmon, if you will introduce those with you.

**STATEMENTS OF VESTAL LEMMON, PRESIDENT, NATIONAL ASSOCIATION OF INDEPENDENT INSURERS; ACCOMPANIED BY ARTHUR C. MERTZ, VICE PRESIDENT AND GENERAL COUNSEL; AND DR. PATRICK MILLER, CORNELL AERONAUTICAL LABORATORY, BUFFALO, N.Y.**

Mr. LEMMON. Thank you, Mr. Chairman.

We would like to have as our first witness, Mr. Arthur C. Mertz, vice president and general counsel. He is going to testify primarily on S. 976.

Mr. MERTZ. Senator, we appreciate the opportunity of appearing here today, and we especially appreciate your graciousness in continuing the hearing to this late hour in order to hear us.

Senator HART. Thank you for being patient with us.

Mr. MERTZ. And we also admire your stamina for being able to last this long. I will abbreviate my statement somewhat.

Senator HART. It will be printed in the record in full.

Mr. MERTZ. Thank you, sir.

We are representing the National Association of Independent Insurers, a trade association of 533 companies of all types and sizes, stock and nonstock, which serve more than half of the insured motorists in America.

With me today is Dr. Patrick Miller, of Cornell Aeronautical Laboratory, Inc., who will talk about the status of research being conducted by that organization on our behalf which is pertinent to this legislation.

We appear today to give basic support to S. 976, subject only to certain qualifications and suggestions which I shall note in the course of my statement. We endorse this bill in its major features, in its broadening of DOT's authority to include promulgation of property loss reduction standards; establishment of tests and procedures to produce comparative damageability data on production models of new cars; the determination by DOT of feasibility of similar procedures relative to vehicle safety testing and data reporting; the broadening DOT standards for State vehicle registration laws to include title provisions; and establishment of further incentives for States to adopt and implement periodic vehicle inspection laws.

In regard to the matter of expansion of the vehicle inspection systems to cover certain postcrash situations, we support the underlying safety objectives, but urge further research and experimentation before determining whether this should become part of the mandatory standards, as I will point out.

Our general endorsement of S. 976 arises out of our profound concern over the rapid upsurge in auto material damage losses. S. 976 should help to make possible the stabilization or reduction of auto damage insurance rates.

NAII, as an advisory organization, is working to develop means of evaluating the impact that better bumpers and other design improvements will have on losses, so as to aid our companies in giving appropriate rate recognition to those improvements.

During the decade 1959 to 1969 the average auto property damage loss incurred by our companies increased about 100 percent. That is, the severity of property damage loss in the typical everyday automobile crash about doubled. Even more disturbing is the fact that the annual rate of increase in that average loss severity has been rapidly accelerating. It more than doubled in the past 5 years. That is the acceleration, the rate of severity doubled.

Although premium levels have been raised from time to time, the loss spiral has outstripped them. This is evidenced by the fact that the loss ratios, which is the ratio of incurred losses to premiums earned, these loss ratios have risen substantially during the same 10-year period.

Between 1959 and 1969 the average loss ratio on property damage coverage for all stock companies rose from 65.6 percent to 81.8 percent, up almost 25 percent.

On collision, the ratio went up from 60.2 percent to almost 76 percent. That was an increase of 26 percent.

Notwithstanding more than a 10-percent reduction in the expense ratio during the same time, their combined losses and expenses in 1969 produced an 11-percent underwriting loss on property damage and almost a 5-percent loss on collision coverage.

On mutuals, the trend was even worse, as I point out in my statement.

Translating this into dollars, these percentage underwriting loss figures for 1969, we find that stock and mutual companies combined lost over \$450 million on auto property damage and collision coverages. Adding in the results from fire, theft and comprehensive insurance, produced over a half billion dollars in aggregate losses on the auto material damage coverages. This compares with about a \$150 million loss on auto bodily injury liability coverage.

It is obvious which side of the picture now represents the major Achilles' heel of our business, costwise. While total earned premium volume for material damage in 1969 was only about 20 percent greater than the premium volume for bodily injury, those material damage premiums produced well over three times the amount of losses.

What are the cost ingredients in these staggering losses?

A year and a half ago, Senator, in testifying at the Senate Anti-trust and Monopoly Subcommittee's hearings on the auto repair problem, we identified four major factors.

One was speed, horsepower and high performance cars.

Another was increases in repair garage charges and overhead.

Thirdly, a spiral in prices for new cars and for crash repair parts.

And fourthly, the extreme vulnerability of today's automobiles to costly damage.

There has been some improvement in the first area, largely because of the leadership shown by one of our member companies late in 1969 in instituting surcharges on "muscle" cars, followed by the same action by other companies, the horsepower race of 2 years ago was aborted and we hope permanently.

Repair garage charges for labor have continued to rise, as evidenced by enclosure 1 to our statement, which shows the trend in some 13 cities, major cities in the United States.

In the decade 1960 to 1970, the average hourly rates in the 13 large cities increased about 90 percent. Here again 65 percent of that increase occurred in the latter half of the decade, and only 25 percent in the first half of the decade.

Next, as far as the cost of cars and replacement parts, in our 1969 testimony we showed that between 1965 and mid-1969 the new car list price on a Plymouth Fury increased 11 percent and that of a Chevrolet Impala and a Ford Galaxie, about 10 percent. Meanwhile, the list prices on the eight major component parts most commonly replaced in collision repairs rose between 20 percent and 36½ percent respectively, 2½ times as fast as the new car prices. This disparity between new car prices and crash parts prices, has special significance to our business, because about 85 percent of our property damage collision claim dollars go for repairing vehicles and only about 15 percent in payment of total losses, that is, where the car is totaled and is not repaired.

Enclosure 2 to this statement, Senator, consisting of three charts, brings these price trend figures forward from 1969 to 1971. And we have these charts attached to the statement.

You will observe that during the past year and a half the increase in list prices for these new cars and for the major crash components bear a much closer relationship to each other. In other words, new car prices and crash parts prices now are going up at about the same rate.

However, this is an improvement in consistency, but we now look at the picture and find that prices both for new cars and parts prices are increasing at an accelerating rate.

So we are getting it both ways now. Not only have the manufacturers' list prices for parts been climbing rapidly, but the effective prices for these parts at the repair shop level have been going up even faster, due to the decline of real price competition at the repair shop level in parts prices. This was due to the widespread disappearance of discounts at that level.

We pointed this out in our testimony before you, Senator, in late 1969. And the revelations, the data we presented then, plus the data subsequently presented by one of our companies, State Farm Mutual, we believe played an important part in bringing about the now pending Federal Trade Commission investigation into the whole crash parts distribution and pricing system. We have been cooperating in that investigation. We hope that it will lead to the opening up of effective competition and improved efficiency in that distribution system. Because we think there could be a great saving to the consuming public if that occurred.

Meanwhile, our staff has been maintaining a continued watchfulness over crash parts price trends. As I pointed out in my statement: our watchdog in this area has in one instance already brought about correction of errors in the published parts price manuals where the prices for certain bumpers were in error, overpriced, and our revelation of that brought the price down. We think a saving resulted from that.

Another avenue we are pursuing is a study of the feasibility of a crash repair research center. Recently we sent a four-man team to England and Sweden to examine the research facilities there. The favorable report they brought back has encouraged us to pursue this avenue further. We hope soon to complete a more detailed study of the practicability of such a center in this country. I personally believe there is in this facility, an opportunity for benefits not only to our business, but to auto manufacturers, repair shops, and the consumers as well.

The most critical area, costwise, and the one on which we have focused primary attention is auto design as it affects damageability. This is, of course, one of the prime subjects dealt with by S. 976.

In our 1969 testimony before your subcommittee, the Antitrust and Monopoly Subcommittee, we listed and analyzed many of the common design features that make modern-day cars unnecessarily vulnerable to damage and costly repair, and we at that time decried the utter lack of functional bumpers, and urged the manufacturers to equip cars with bumpers that would withstand everyday, low-speed traffic mishaps.

As you know, one of our companies subsequently widely advertised its offer to make a discount, offer a discount on cars equipped with bumpers that could withstand specified barrier crashes. Certain other companies have followed suit.

Your 1969 auto repair hearings, Senator, and the chain of events that followed, including the issuance of bumper standards, have certainly signaled a major turning point in the crusade for safer, saner cars. Damageability considerations and bumper technology have now been thrust to the forefront of attention by the auto manufacturers in their design planning. Indications are they are now mounting extensive research efforts to bumper technology and damage minimization, and we are encouraged by these efforts. Equally important, the issue has been forced to the forefront of public attention, which should give encouragement to the manufacturers and the Government that the public is ready for safer, more practical care design features.

The initial bumper performance levels set by DOT, particularly the bumper requirements, have fallen short of what had been anticipated and hoped for. One of the reasons cited by DOT for only requiring 2½-mile-an-hour barrier rear bumper capability on 1973 models is its conclusion that a 5-mile capability "would involve extensive structure redesign without a commensurate increase in safety."

Of course those bumper standards are expressly keyed to safety considerations, because the act of 1966 does not expressly empower DOT to give weight to vehicle damageability.

Your bill would close that gap in DOT's jurisdiction, and we support such a move.

I then point out on the balance of that page some of the reasons for that, and Dr. Miller will discuss some of these points when he testifies.

A subsidiary question presented by S. 976 is whether to spell out specific minimum bumper requirements in the statute itself, as your bill now does, or whether to leave such technical specifications to the DOT.

We believe the wiser approach is to avoid statutory specifications and give DOT the responsibility for such determinations. The choice of the best bumper involves interplay of a great number of factors. We believe an administrative agency should decide it.

We would suggest, therefore, that paragraph 125(c) on page 5 of the bill be deleted and that paragraph 125(b) be broadened to make it include bumper standards. But we suggest it should be spelled out that the Secretary not only should promulgate, but should periodically revise and update all such standards, which I am sure was implicit in your intent, but perhaps it would be wise to spell it out, to make it clear the overall objective is timely progressive improvements of design as expeditiously as is feasible in the light of minimum leadtime reasonably needed by the manufacturers to effectuate the change.

Section 5 of S. 976 provides that by July 1, 1972, DOT shall promulgate procedures under which all manufacturers must test production models of new vehicles, and also they should determine the feasibility of similar tests as to injury safety considerations. It also provides that the results of the tests must be reported to DOT and DOT is to make them available to the public and insurance companies and ultimately is to advise Congress on the extent to which our industry is utilizing such information.

We support these provisions. We respectfully, however, urge deletion of paragraph (b) (3) on pages 8 and 9 of the bill requiring automobile dealers to provide comparative insurance cost information to prospective car buyers.

The reasons for our suggesting that are set forth in my statement. I won't read them but will submit them for your consideration.

Subject to that one suggestion, we endorse section 127.

More than that, I want to emphasize that NAIH, as a qualified rate advisory organization, is preparing to be of aid in every way possible in enabling the companies to give appropriate recognition to cars with improved bumpers and other damage-reducing design changes, just as soon as they have credible data on which to base such action.

We have been studying ways and means for developing the kind of data the companies will need. If possible, a method should be found to rate the new car models at the time they enter the marketplace. And your bill, I note, envisions the same need.

When the cars come to the marketplace is the time that premium rate variations will have the greatest significance to the buying public. To this end, in 1970 we commissioned Cornell Aeronautical Laboratory to conduct research on our behalf into an area that has never been previously probed. The question is: Can the analytical engineering process or a combination of that process and a minimum amount of crash testing, a useful tool for predicting the damageability of different vehicles. The encouraging results of that research will be described by Dr. Miller in just a moment.

As we indicated, we intend to make the products of that research available to manufacturers, to DOT, to this committee and other interested agencies.

DOT has already made some informal inquiries into the progress of this project.

Our final comments pertain to those provisions of S. 976 dealing with Federal standards for State vehicle registration and title laws

and for State vehicle inspection programs. We urge that paragraph (b) of section 501, on pages 5 and 6, be amended so as to provide that the Secretary of Transportation in promulgating standards for State registration and uniform title programs, may consider the uniform vehicle code and model traffic ordinance provisions, but is not bound by them as the bill would seem to require.

We consider the uniform code and model ordinance to be valuable tools, but we do not believe, as a matter of policy, the work product of any private or semi-private organization should by Federal statute be automatically mandated upon all of the States, as required by the legislation.

In other words, we think this deserves consideration by DOT in connection with the standards, it should have advisory weight only and not binding effect on DOT.

The remainder of title V of S. 976 would call for the broadening of existing standards for State vehicle inspection programs, and for the adoption of additional incentives to the States for adopting and further implementing such programs. Generally speaking, we support that.

I pointed out that it has been our longstanding policy to support and promote any measures that increase the level of safety of vehicles on our highways.

We also want to make it clear that we share the desire of this committee to do everything possible to assure that vehicles sustaining collision damage involving safety-related parts do not go back on the highways in unsafe conditions. We would be very foolish to take a contrary position because every unsafe vehicle on the highway presents not only a personal hazard, but also an insurance hazard.

We, therefore, wholeheartedly agree with the safety objective involved. The question is: How can the objective best be achieved, whether by a requirement that all vehicles involved in crashes where safety-related parts may be damaged should undergo State inspection following repairs, or by a requirement that the body shop or garage certify the safety of the repairs or by some other means or a combination?

We are not sure at this point. We do not know the answer. And we have not found the answer in any research that has come to our attention.

The one study we have seen, which is the Southwest Research Institute study, does demonstrate how latent damage to safety-related parts can sometimes occur in collisions, and it suggests that it would be desirable to have reinspection of vehicles following collision repairs. But it also indicates that to do so would require more stringent procedures than are now used for periodic inspection. And it also proposes a certification procedure by repair shops in lieu of inspection, where no periodic inspection requirements are in force.

One thing I might add here, we noted in the SWI report it noted that some six States have laws which call for some kind of postcrash inspection. In no other report could you find that the research team had ever gone out to find out how these laws were working, and this is one of the questions we think DOT should go into, in determining how this should be done.

We point out the periodic motor vehicle inspection, although important and a laudable concept, has also proved one of the most complex and difficult in implementation. Some of the States had adopted such programs immediately after the Safety Act of 1966 and had opposition over practical problems which have led to the introduction of legislation to repeal the inspection laws.

Although that has been generally forestalled and the laws remained, several of the programs were amended to water them down a little.

So in light of these practical considerations, we would respectfully suggest the bill authorizing and directing DOT, before taking any action extending the vehicle inspection standards to cover the post-crash problem, to make a comprehensive study of the whole problem and the best means of alleviating it or minimizing safety-related hazards, which research, we think, should include evaluation of the results in States that have and are trying the post-crash inspection procedure, and perhaps the DOT sponsorship or support of experimental pilot programs in one or a few States, to try to find out what the optimum program would be, how it best can be implemented.

What we are suggesting on this subject is it be treated in somewhat the same manner as the bill treats the subject of testing procedures for manufacturers in determining injury potential of various vehicles under section 125(d).

In conclusion, we wish to commend this committee and the sponsors of S. 976 for having identified and highlighted what is by far today's more serious source of spilling losses and rising auto insurance premiums, and for having proposed legislation aimed at that program.

We believe enactment of S. 976 with the modifications we have suggested would serve the interests of the American consuming public.

If your committee should desire any further particulars on any points we have raised, we will be very glad to furnish them and cooperate in any way possible.

That completes my remarks and Dr. Miller is with me. I will follow the wishes of your committee as to whether you would rather ask me questions first or have Dr. Miller proceed first.

Senator HART. A point I would want to comment on here that was raised by your testimony related to the 100 percent cost increase in the last decade of costs.

As I look at it, and as we have heard this testimony, in the area of vehicle repair, to the extent that labor, service, are involved, whether it is the garage repairman or post crash, the insurance adjuster's time, the lawyer's services, individuals will continue to have to do that kind of work and the technology is not going to be able to effectuate cost savings.

So to the extent that we can identify the means of reducing the likelihood of the crashes, preventing the crashes, it is in that area where we could look for the big cost savings. We are sort of kidding ourselves into thinking that even the most disciplined supervision would enable us to substantially reduce the costs reflected in the personal service area.

Am I correct in that? We really have to look at what Cornell is looking at.

Mr. MERTZ. Yes, I think I would be in basic agreement with what you just said. I might say this, I think there is room for improvement,

cost savings, in the area of repair technology as we have gathered from looking at the experience in England and in Sweden.

But there is a very definite limit to how much saving we can achieve there, given the same cars we are dealing with today.

Because I think there are many savings they have made, for example, in England and Sweden in things like the paint process, and better welding techniques, and better use of quarter panels. And there is an opportunity for saving there, but it is nothing, in my opinion; it does not compare with the opportunity for saving through improved design of the automobile and particularly bumper technology.

In other words, I suppose it could be roughly comparable to preventive medicine.

Senator HART. I just whispered to Mr. Sutcliffe it is the same thing.

Mr. MERTZ. Right. In other words, you can do just so much—

Senator HART. Yes; group practice will help somewhat, but staying healthy is the chief effort.

Mr. MERTZ. Yes. Of course, one of the reasons we are interested in the technological side of it is this: No. one, as car design is improved, we come up with improved bumpers, each year at the most that is going to replace only 10 percent of the vehicles on the highway. So if we have an ideal bumper a year from now, and let's say it has a tremendous effort on cutting down the losses for cars that have it, it is still going to take 10 years before that achieves a full effect.

In the meantime, we have to stay in business. So the repair technology side is very important. The other thing is I think that just for the health and preservation of the repair industry, something needs to be done. We feel that one of the greatest benefits that could come from a crash repair research center would be the innovations for the repairmen themselves.

We are talking about something where there would be experimentation in improved technology and very definitely try to get them to participate in seeing what is going on, improve their techniques, and they would be one of the prime beneficiaries of it, because we know that they are losing men. They are having a hard time.

Part of it, I think, is because of the technology not having kept up. The efficiency of operations of their enterprise has not kept up with the times. We think this would be a great help to them, too.

Senator HART. I am reminded that with many others we have been urging the insurance industry and the automobile manufacturers to establish, to set up such a research center for the reasons you have explained. What does Ithaca have to tell us?

Mr. MERTZ. Senator, I just wanted to say one other thing in introducing Dr. Miller, that he is a native of Michigan, and grew up near Traverse City and was educated in the Michigan schools.

Dr. MILLER. Thank you. I am here today to present information on the vehicle damage study at Cornell Aeronautical Laboratory that is being sponsored by the National Association of Independent Insurers. In addition, I would like to make some comments concerning the relationship between designing structures for vehicle damage reduction and for passenger safety or protection.

Before proceeding with the discussion on the vehicle damage study, perhaps some background information would be helpful to the committee. Cornell Aeronautical Laboratory is an independent, nonprofit,

scientific organization wholly owned by Cornell University. The laboratory, as an independent research organization, has participated in various scientific investigations. One of the most notable activities has been in the area of automobile research where substantial contributions have been made during the past 20 years.

With recent increased emphasis on automobile safety, research in this area has expanded dramatically during the past few years. Indeed, research directed toward providing occupant protection during automobile crashes constitutes the most significant and important efforts within the present automobile research projects. The U. S. Department of Transportation is the major sponsor for these projects which include, for example, studies related to automobile structural crashworthiness, underride guards for heavy vehicles, development and testing of inflatable occupant restraint systems, development of computer models for simulating both the automobile and its occupants during various crash situations, development of an accident reconstruction model, and the investigation and analysis of accidents in the western New York area.

It was principally the automobile safety research efforts that provided the impetus for our becoming interested in the problem of automobile damage during low speed collisions. From a structural point of view, there is a close relationship between the structural requirements during low speed collisions and the structural performance needed to provide for occupant protection during the higher speed impacts. Indeed, if consideration is given simultaneously to both problems, structural requirements designed to reduce vehicle damage could result in corresponding improvements related to occupant protection.

Dr. William Haddon, President of the Insurance Institute for Highway Safety, recently appeared before this committee and referred to a statement of mine which essentially indicated that there is no apparent incompatibility between designing vehicle structures for occupant protection, while at the same time, providing for vehicle damage reduction during the low speed collisions. I would like to take this opportunity to reinforce this point but to present the arguments in a slightly different manner.

Senator HART. I should explain that I think Dr. Haddon was responding to a question that I asked as to whether there is an inconsistency. We have been on their back to make cars safer. One way to do this is to make car front ends collapsible, and now we are on their back because it is so fragile.

Dr. MILLER. Yes. The points I am making there are, the strength of present automobile structures is too low, that injuries do not occur during low speed impacts, because of the low severity of the collision, and not because of the structure design.

The third point is that the occupants' response during low speed collisions is independent of the vehicle structural response.

The fourth point I would like to make there—

Senator HART. Wait a minute now. Read that third one again.

Dr. MILLER. The occupant response at low speed is independent of the vehicle's structural response. What I am really saying—

Senator HART. What happens to the passenger is—

Dr. MILLER. What happens at low speed is, two cases must be considered. You have an unrestrained occupant in one instance. The vehicle will stop and the interior stops before the occupant starts to move, so he will hit the inside of the vehicle at about the same speed that the vehicle was traveling upon impact. Since the vehicle interior stops before the occupant hits it, the unrestrained occupant cannot benefit from the structural response.

Now, the other case is where you have an occupant wearing a restraint system. The vehicle comes in at low speed, but the restraint system has some slack in it, because of the flexible belt and the soft nature of the human tissue. It will take a velocity change of at least 5 miles an hour between the occupant and the vehicle interior before the restraint system tightens up. So you have a velocity change in the order of the low-speed change before the restraint starts to work.

So even in the case of the unrestrained occupant, I seriously question whether the occupant gains any benefits from the structural response of the vehicle.

Mr. SUTCLIFFE. At that point let me ask you is that information based upon present vehicle design?

In other words, there is no ridedown effect in existing vehicles?

Dr. MILLER. No. There can't be, because as I pointed out in the technical discussion, and this is partially based on information generated by the people at General Motors, they came up with a general indication that the distance between the occupant and the interior must be half the crush distance of the vehicle before he can benefit from ridedown.

So for a 5-mile-an-hour collision, in the test we will show later, we had about 5 inches of collapse. That means for ridedown to occur, an occupant would have to be  $2\frac{1}{2}$  inches away from the instrument panel to benefit from ridedown, and for 10 miles an hour collision, he would have to be 9 inches away.

People just don't sit that close to the interior of vehicles.

Mr. SUTCLIFFE. And that situation and analysis was with present vehicle structures?

Dr. MILLER. Yes, our tests were on 1970 cars.

Mr. SUTCLIFFE. And the information they presented was on present vehicle structures?

Dr. MILLER. We have looked at both present vehicle structures and structures that might be constructed.

Mr. SUTCLIFFE. Let me be specific as to why I asked that question.

We have now been given a bumper standard by the Department of Transportation designed to insure the safety of the vehicle in operation. There is no requirement in that standard as to the impact, on the passenger himself, of the bumper design that is utilized to meet the bumper standards.

On the basis of the information you have presented to us, it would seem that there would be no need, at that speed, to have any kind of standard related to the passenger.

However, let me pose this hypothetical question and have you respond to it: What if the 5-mile-per-hour front-barrier capability set forth by the Department of Transportation was met by a device in the front of the vehicle that had a bounceback, G force, coextensive to the impact speed.

In that situation, would the G force level of the passenger be markedly increased, whether in a restrained capacity or unrestrained capacity?

Dr. MILLER. What you would do in that case, at 5 miles per hour, you would effectively take a 5-mile-an-hour collision and turn it into an acceleration equivalent to a 10-mile-an-hour collision. That is the worst situation you could have. My feeling here also is that we have to get somewhat above 10 miles an hour before you have a real problem with injury.

Now, if the specification—so I would say that omitting the rebound at 5 miles an hour is not a problem. However, if the standard was set for 10 miles an hour, I would question whether you did not have to consider the rebound phase, because a 10-mile-an-hour collision, you see, would have the potential, if you had full recovery, full rebound, resulting in something close to a 20-mile-an-hour collision. I believe collisions between 10 and 20 miles an hour are in the range where you are getting into the injury threshold.

Mr. SUTCLIFFE. You make the statement in your prepared testimony that a 10-G force level is possible at a 5-mile-per-hour barrier crash. Are you suggesting that a 20-G force upon the restrained or unrestrained occupant is tolerable? Not injury producing?

Dr. MILLER. Yes. I didn't go so far as to recommend that, I indicated in the testimony that I would recommend limits consistent with the safety vehicle, the proposed 2,000-pound safety vehicle, because I don't see how those could be questioned. Even a 20-G response does not present any problem concerning occupant injury as far as I can see.

We are going to look at that in a little more detail next year. I really think that the occupant's response will be found, during low-speed collision, to be completely independent of the vehicle response, so I don't think it will make any difference.

But I think that with the higher acceleration level, rebound may increase, because you won't be able to dissipate the energy as effectively.

But personally, I don't feel that this will constitute a problem.

Mr. SUTCLIFFE. For the record, could you provide the committee with the biokinetic information that allows you to make the judgments as to what the G force tolerances for the passenger would be?

What the G force tolerances are before you would consider it a problem in injury production?

Dr. MILLER. Well—

Mr. SUTCLIFFE. You don't have to do this at this point, just submit it for the record, so we have that information in the hearing record.

Dr. MILLER. Yes. Well, the point here I think, though, that should be understood, is we are not only talking about the deceleration force, but we are talking about some measure of that deceleration force.

What we are really talking about is something that is looked at a severity index. What that index does is weight the deceleration values and give more weight to a higher value than it gives to a lower value.

Now, the severity index, commonly called the Gadd number is currently being used. We speak of numbers on the order of 1,000 on the head as being near a fatal situation. In all of these situations I am talking about, I am sure you will find Gadd numbers well below that, on the order of 200 or 300, or something like that.

And we could provide that kind of information to you.

Mr. SUTCLIFFE. Thank you very much.

Dr. MILLER. Then finally, the other point that I would like to make is that increasing the structural strength means the bumper could be placed a reasonable distance away from the sheetmetal, which would improve the vehicle damage situation. But, more importantly, I believe the increase in the strength would provide more distance for energy absorption during the higher speed impacts where occupant injuries normally occur.

All I am getting at here is that if we have a very soft car, and 10 miles an hour is really a very small amount of energy when you are talking about something like a 40 mile an hour crash, in fact, a 10 mile an hour collision has one-sixteenth of the energy that you have in a 40 mile an hour collision.

So if you are going to give up 18 or 20 inches of that structure, just to take care of about 6 percent of the energy in a 40 mile an hour crash, then the remaining distance between the occupants and that 20 inches has to be used to dissipate over 90 percent of the energy. That is the way the present situation is.

So now if we can reduce the 10 mile an hour collision so it takes 4 to 5 inches, then we gain something on the order of a foot for energy dissipation at the higher impact speeds. It is within that context that I see the two problems directly related and feel improvements of the vehicle damage situation would result in a corresponding improvement for occupant's protection.

I am talking about protection of restrained occupants, now, during the higher speed collisions.

Mr. SUTCLIFFE. Perhaps I can ask a question at this point. You have done experimental work under contract with the National Highway Traffic Safety Administration on an occupant protection system built into the vehicle, oftentimes designated as a "plastic hinge;" is that correct?

Dr. MILLER. That is a structural concept that we developed and worked on. We are working on that at the present time for the National Highway Safety Administration. The program is Basic Research in Crashworthiness, Contract FH-11-7622. Well, we have increased the strength, but what we are trying to do in that program is get a uniform rate of energy absorption during the crash distance of the vehicle.

Mr. SUTCLIFFE. What happens when you bang that plastic into a barrier at 5 miles an hour or 10 miles an hour?

Dr. MILLER. Well, we did that. We were not, I guess, strictly speaking, required in our work statement to do it, but it was an opportune time one day when we were out on the track. We ran 5, 10, and 15 mile an hour impact tests. At 5 miles an hour, we observed no damage; at 10 miles an hour we began to observe some permanent collapse. The peak deceleration levels I think were about 12 to 15 G's for 5 miles an hour and perhaps 20 G's at 10 miles an hour.

The problem I see is not the deceleration level, but we did have more rebound than I would like. We are going to look at that area and I hope during the next year come up with a better way of mounting the

bumper to the connecting struts. I think we can eliminate that rebound problem or reduce it substantially.

Mr. SUTCLIFFE. So in your crash-worthiness program, a technology developed for better crash-worthiness, had a direct payoff in the property damage susceptibility area, or appears to have?

Dr. MILLER. I think it has potential for it. I don't want to make premature claims here, because as you know on that crash-worthiness program we are primarily interested in looking at the problem in terms of severe accidents, to see what we can do for the occupant. Once we come up with a system that will give the occupant benefit under the severe collision situation, then we want to make sure that at the low end of the velocity scale we have not changed the injury potential.

Because the fact remains that about 10 percent of all accidents result in injury. We don't want to increase that, and there is no point in our opinion in that program looking at the low end of the velocity range until we have demonstrated we can do something at the high end.

Now, we first looked at severe single vehicle accidents, and we came up with a structure that we thought, and we know demonstrates better performance. Then we considered what would happen if we took this vehicle structure and introduced it onto the highway, where it would not be likely to hit the same kind of vehicle, but rather hit other production vehicles. So this year we have conducted a number of car to car tests, where we have impacted the modified structure into essentially production vehicles. We have found that in front-end collisions, the performance of the production vehicle is not degraded from what it would be if involved with a present vehicle.

Now in side impacts, we find we have degraded performance somewhat, so we are working further on the front structure—

I am talking about an impact where a modified front structure hits the side of a production vehicle. We feel that we may have to back off on the strength requirements perhaps in the first 6 inches of the vehicle to insure that the side impact situation is no worse than it is now.

We don't feel we will have to reduce the strength in more than the first 6 inches, of the front of the vehicle and we are not talking about a reduction to the levels of present vehicles; we are talking possibly—it is hard to say, but maybe 10 to 20 G responses, in that initial collapse distance. But these changes will be dictated. I am convinced, by the side impact problem, not by the response at lower speed collisions.

Mr. SUTCLIFFE. Thank you very much. I didn't mean to interrupt your prepared testimony.

Dr. MILLER. I would like to make one more comment on this. When I was talking about the increased potential for occupant protection with increased strength of the bumper this relates to the front structure. I do not want that to be interpreted as meaning that I am not advocating improved bumpers on the rear of the vehicle; but with an improved bumper on the rear of the vehicle, it could not be argued that the bumper would have a corresponding increase for the protection of occupants simply for the reason that very few occupants are seriously injured in rear-end collisions, where with front-end collisions you have a high number of occupants that are injured.

I just wanted to point that out so it would not be construed that I was advocating lower requirements in the rear of the vehicle, that is

not the case; it is just that we could not argue you had a safety benefit accompanying it.

Now, I would like to present some information on the National Association of Independent Insurers' vehicle damage analysis project. The objective for this study is to determine the feasibility of using mathematical analysis as a tool in determining the damage susceptibility of automobiles. The fact that this is a feasibility study should be emphasized.

Last spring NAII contacted Cornell Aeronautical Laboratory concerning the possibility of implementing a vehicle damage study. Their purpose was to determine what approaches might be employed if one was to evaluate the damage susceptibility of a wide range of vehicles under a number of different impact conditions. One approach, quite obviously, would be to purchase a large number of vehicles and then subject each vehicle model to the various test conditions. When all possible test conditions are considered it soon becomes apparent that this approach—if continued year after year with all classes of vehicles—would be an extremely time-consuming and expensive proposition.

A possible alternative approach would be to develop an analytical model that could be used in conjunction with limited experimental testing to eventually accomplish the same general objective. It should be noted that the intent in developing such an analytical model was not to replace the need for conducting controlled tests, but rather to greatly limit the number of vehicle tests that would be required.

Another benefit of such a model would be that it could identify the contributions that various vehicle components might make in terms of reducing vehicle damage. For example, the effect of changing the structural properties of the bumper could be quickly evaluated by a computer run without resorting to the fabrication of a vehicle and subsequent testing. Likewise, the effects of structural changes for other components could be quickly and economically investigated through such computer runs.

Controlled tests to validate these computer simulations were conducted. Now we will show some of the films taken from these test results. It should be noted that the only purpose of these tests was to validate the mathematical model.

(Showing of film.)

The first scene is of the impact at 5 miles an hour. The speed is a normal jogging speed. The vehicle is operating under its own power during all of the tests. This is a 45-degree view, high-speed photograph, a thousand frames a second. The vehicle collapsed about 5 inches, very nearly the same as we predicted with the computer model.

Here is an underneath view. It is really this view that is of the most interest to the structural engineer. We paint the vehicle structure different colors so we can identify the various vehicle components. This is the vehicle after a 5-mile-an-hour frontal test into a rigid pole. This is a real time rear-end impact at 5 miles and hour. This collision resulted in about 4 inches of exterior deformation and that is very close to what was predicted by the computer model.

We see the vehicle after the impact. An identical vehicle was subjected to 10 miles an hour front and rear tests. We actually did the rear test before the front. The reason we did that is because the radiator was lost in this test, but I am showing it in reverse order.

Again this is a high-speed photographic view. This test resulted in about 17 inches of deformation. The computer program predicted a value of 14 inches. Here we see the view from underneath the vehicle graphically showing the displacement of the radiator.

Those wheels, incidentally, in the middle of the screen are guide rollers that are used to guide the vehicle prior to impact.

This is the vehicle after the 10-mile-an-hour collision into the rigid pole. Here we see the 10-mile-an-hour rear impact.

I am showing this underneath view because it shows that substantial deformation of the fuel tank took place. The tank was loaded with a fluid that demonstrates some of the characteristics of gasoline, and it should be noted that no leakage occurred.

This is the vehicle after the 10-mile-an-hour rear collision.

(End of showing of film).

Now, we have summarized the comparison between the predicted deformations and measured deformations, and you can see for the 5-mile-an-hour cases the computer predictions are very close to those measured; however, at 10 miles an hour we are comparing values of 14 to 17½ and 10½ to inches. So it is worth noting that the analytical predictions were reasonably correct for 5-mile-an-hour impact; however, for the 10-mile-an-hour cases they tended to predict values somewhat lower than those recorded in the tests.

These results for the 10-mile-an-hour collision were further investigated after the test. As a result of this investigation the modeling of the hood and radiator support structure has been refined. Similar refinements were made for the trunk region on the rear structure.

We are now in the process of checking the validity of the refined program. For this purpose a 1969 Ford has been purchased. A Ford was selected for these tests because it represents a structure that is quite different from that of the Chevrolet. Measurements have been made and the input data are being prepared for the computer. It is expected that the computer analysis will be employed before the end of the month. At that time we will conduct 10 mile-per-hour front and rear tests on the 1969 Ford. These results will be compared to those predicted by the computer.

At the present stage of the study our tentative conclusions are:

(1) Within the scope of this program the feasibility of predicting vehicle damage has been established. That is, the present model is highly accurate at 5 miles per hour and is expected to be refined to be accurate for the 10-mile-per-hour collisions. When this latter phase is completed a valid model will be available for this type of impact condition.

(2) An attempt should be made to generalize these limited results to other situations; that is, to consider different impact conditions and different types of vehicle designs. The result of this generalization would be a computer program that would allow various potential users the flexibility to quickly and economically analyze various vehicle damage situations.

At this point I would like to briefly summarize how such a generalized analytical model could be used as a tool in evaluating the low-speed structural performance of automobiles. An important application for this model would be in reducing the number of full-scale tests required. For example, a vehicle might be impact tested at 10

miles per hour and mathematical analysis used to determine how the vehicle would perform at other impact velocities. Furthermore, usually only minor structural differences are evident between many of the automobiles produced by the same manufacturer. The mathematical model could be used to determine the effects that these small differences would have on performance without requiring full scale tests of all vehicles produced by a single manufacturer.

We plan to issue a final report covering the project early this summer. Copies will be available from either the National Association of Independent Insurers or Cornell Aeronautical Laboratory. Upon request copies will be furnished to Congress, automobile manufacturers, governmental agencies and other interested parties.

Senator HART. Thank you very much, sir.

I confess I am going to have to read much of what you told us more than one more time, but I do get one message clearly. You see as completely within hand the accuracy of computer testing rather than testing the production automobiles.

Dr. MILLER. I think it is essential that we begin to do this, because as I said perhaps somewhat facetiously at times, that if we keep up this business of crashing cars for safety and for vehicle damage, we are soon going to be crashing as many cars as the automobile manufacturers are selling to the consumers.

So it seems to me we have to find ways of cutting down the number of tests. And this I would hope would help.

Senator HART. I am not sure I want to go on the record as opposing selling twice as many cars as we presently do.

Mr. MERTZ. Senator, from a layman's standpoint, I am certainly not an engineer, it seemed to me—and Dr. Miller can disagree if he sees fit—I don't think he will disagree, because he points this out in his statement, I think it is very significant—it is one thing to determine that when a certain vehicle crashes against a certain kind of barrier or in a certain situation, a certain amount of damage occurs, but that is only part of the battle. The most important thing is to find out why did it occur, why was the damage as great as it was? What feature of its construction contributed to the damage and what minimized it?

In other words, the analytical approach we felt at the outset hopefully would help us not to tell just what happened, but why it happened. And therefore enable zeroing in on the feature that could be improved. Because a given car might have embodied in it a number of good design and bad design features and they are balancing each other and they might produce a sort of lukewarm result.

If we can separate out which are good and which are bad, it would help them reinforce the good and minimize the bad.

Does this sound right, Dr. Miller, that it would help give you the answer as to the why something happened?

Dr. MILLER. Yes, that is essentially it. We need a way of analyzing the situation to really understand the interaction between the various components. This is one possible application of the mathematical tool.

Senator HART. I am just trying to fish out from the many sets of figures we have, how much we are talking about in dollars each year as a result of the kind of accidents that we saw on the film, or all accidents.

I am referred to a figure of \$5,500 million as the annual economic loss in car damage. That is the figure projected for this year.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Dr. Miller, it is important for the purposes of our hearing record for you, in your capacity and with the testing you have done, to answer the following question or series of questions to the best of your ability.

Let me suppose that I took six very refined pictures of an automobile that had been involved in a minor front-end collision, and I put them before either your trained eye or the trained eye of a claims adjuster. And I did this not just with one vehicle, but with a whole series of vehicles that had been involved in front-end collisions and rear-end collisions.

Could you, with any degree of precision, tell me the speed into the particular object that those cars had been traveling?

Dr. MILLER. Well, first I would like to say that that is not the type of thing that I do, and I would be probably less accurate at it than the professional people that do it.

We have at Cornell an accident research branch that I referred to earlier in the statement, and we have people that are trained in doing that type of thing. In fact, the only way you get the impact speed of accidents is to look at photographs or look at the vehicles and essentially have these people that are so trained make these estimates.

Our experience at Cornell is to the degree that you probably could make the following separations: You could probably group cars somewhere in the order of 0 to 5 miles an hour.

Mr. SUTCLIFFE. Could you tell between  $2\frac{1}{2}$  miles an hour and 5 miles an hour, in your opinion?

Dr. MILLER. I doubt it. I do not think they could. I think they could tell the difference between a 5- and a 10-mile-an-hour collision. But supposing it was 5 and 7, I seriously doubt that these people could provide that type of precision. At least the people at Cornell tell me that and that is your experience. Of course, no one really knows how accurate you can be, because there is no way to really check this. But our experience would be that you could not tell the difference between, say, 5 miles an hour and perhaps 2 or  $2\frac{1}{2}$  miles an hour. But, again, this must be accepted as a judgment on the part of the people doing that work, because there is no way you could check to see how precise it really was.

Mr. SUTCLIFFE. Even as to one individual going over all of the claims and the pictures, you still question the accuracy of determining precise speeds of impact for those accidents?

Dr. MILLER. Right. Particularly in the low-speed range.

Mr. SUTCLIFFE. Particularly between  $2\frac{1}{2}$  to 5 miles an hour.

Dr. MILLER. Yes.

Mr. SUTCLIFFE. Or 5 to 7 miles an hour.

Dr. MILLER. Yes.

Mr. SUTCLIFFE. Thank you.

Mr. Mertz, let me ask you a couple of questions based upon your testimony.

Mr. MERTZ. Yes, sir.

Mr. SUTCLIFFE. You mentioned that some insurance companies have advertised a cost savings for their collision premium ranging from

perhaps 10 to 20 percent. Has your association surveyed your member companies to determine how many other companies within your association would follow suit if property loss reduction standards were set on motor vehicles or rating systems developed for those vehicles?

Mr. MERTZ. We have not surveyed the full membership and asked that specific a question, but we have, I would say, a pretty good cross-section of sample in our board of governors, which consists of about 35 companies, companies of all sizes. I would say those 35 companies probably write 75 percent of the premium volume, maybe 70 percent of the premium volume of our companies, so it is a pretty substantial segment. It has been discussed in our board, and our board is on record as a matter of NAAI policy urging our member companies to give appropriate rate recognition to design improvements, bumpers and other design improvements, just as quickly as credible data can be produced to make those adjustments.

Now, I dare say that there may be some variations among the companies as to how they do it. Several companies, on that board, have indicated they have already filed in several States a discount, and they are ready to give it if the bumper meets certain qualifications.

Others have said in response to our questioning of them that they do certainly intend to give rate recognition, they want to, they will just as soon as there is credible data upon which to base that.

I can say that it is my expectation that there will be a very good response by our companies to giving rate recognition just as soon as we can provide the data on which to do it.

Now, of course, this would mean that the improved bumpers are going to have to come out. They have to be a fait accompli. You have to see them and be able to make some pretty good evaluations as to what the loss-producing propensity will be.

We hope, too, when the manufacturers come out with those models of cars with those bumpers, that the manufacturers will come forward—of course, if S. 976 has become law and is in operation, they have to provide the data that you call for, that is going to be a great source of that data. But absent that, we would hope the manufacturers would provide some good hard data as to what they expect their bumpers to do in terms of reducing the loss exposure.

Then our job would be to evaluate it and see whether it is sound. This is, of course, where Cornell comes into the picture and its experimentation.

Mr. SUTCLIFFE. Have you or anyone within your organization had an opportunity to do any cost-benefit analysis, analyzing the amount of potential premium that could be saved by consumers compared to any potential increase in cost for new bumper technology?

Mr. MERTZ. No. One serious obstacle we run up against is we have no access to any figures as to what the new bumpers are going to cost and what they should cost. Some of the manufacturers have in discussions with us given figures, not just with us, but I think in public statements. General Motors has made some projections as to what they think it will cost, or what they will have to add to the price to put a bumper of a certain capability on a car. But we have no way of going behind that and determining whether we would agree or might disagree with them on those figures.

If we could be supplied with the data that would show—if we could be shown, let's say, some prototype information about that car, its bumpers, the drawings of it, in some detail, I believe we could, through Cornell, as they perfect this technique they are working on, apply that to real world data. This is our next step, to develop the real world data about crash configurations, how many front-enders, what angle and so forth, that they could translate into information on what that would do to the hazard, how much it would reduce the hazard. So we could develop that information on the car and its performance if we were given the proper information.

But, as far as the other part of the question, the additional cost of that bumper, putting it on the car, we are really in the dark and we do not know any way to ascertain that other than from the manufacturers supplying that information.

That brings in the question of whether there will be some additive cost or whether it is something that should be considered——

Mr. SUTCLIFFE. Let me say we hope these hearings will be helpful in providing that kind of information to the insurance community.

Let me ask you, in your experience in purchasing a new car, when the person makes up his mind to buy the car, in a time frame, and when he then obtains the insurance for that car, does the decision to buy the car precede or follow the decision or the search for insurance?

Mr. MERTZ. I think in most cases the decision to buy the car precedes the search for insurance, because in most cases the buyer already has a car, he already has insurance, he is not required under his insurance policy even to notify the company about having changed cars until commonly at least 30 days to notify them and his insurance automatically covers any new car he buys for at least a period of 30 days.

So I think most purchasers, they would not at the time they buy the car, they would not be either simultaneously buying insurance or previously.

Mr. SUTCLIFFE. Given that circumstance, how are insurance rate differentials based upon the characteristics of the motor vehicle going to influence the free market system to encourage the purchase of vehicles with low susceptibility to damage? In other words, how is the consumer going to know that if he purchases "X" car his insurance rates will be lower than if he purchases "Y" car, if in fact the search for insurance takes place after he has made up his mind to buy the car?

Mr. MERTZ. If I know human nature, and in the auto manufacturing business, just as in the insurance business, the auto manufacturer whose car gets a good rating is not going to hide that fact under a bushel, they will let the public know about it. I would anticipate the first thing they would do, once they find out what their rating is, is to notify all of their dealers, and their dealers will be using that as a sales tool for the sales of those cars.

I believe this has happened in England and in Sweden. And there where they rate cars. in Sweden, for example, where they rate cars for insurance, partly because of design, largely because of design——

Mr. SUTCLIFFE. Let me stop you there.

You mean General Motors is going to let its Oldsmobile Division advertise the fact that it has much better bumper capability than the Chevrolet Division?

Mr. MERTZ. Well, maybe so or at least better than Ford. And it isn't going to be so much the distinction between Oldsmobile and Buick, as it will be between Chevrolet Impala and a Ford Galaxie. That is where they will do the advertising.

By the way I have in my briefcase and I will leave with you, an advertisement in a magazine that I clipped out just before coming here, in which an automobile manufacturer has already bragged about the fact that the rates on its car, which is in somewhat the sporty category, that this car gets standard insurance rating, and that is the headline in the ad "Our car has standard insurance rating."

Mr. SUTCLIFFE. So this is the reason you don't think it is necessary to provide any kind of touchstone cost information to the car purchaser at the time of purchase, that he will have already been given the information as to the insurance cost of that particular vehicle through the advertising media.

Mr. MERTZ. Yes. And let me make myself clear on what we were objecting to on that provision. As we read the provision, it seemed to require the dealers in effect to become insurance experts and provide a lot of detailed information about rates of different companies and rates of various cars. Perhaps that was not the intention of it.

Mr. SUTCLIFFE. Let me stop you there and perhaps explain that cost savings for the youthful driver may be much greater than for the average driver, middle-aged driver.

Therefore if the youthful driver had that information, it might profoundly affect his choice of vehicle. That is why we had some differentiation as to the age of the person. We weren't asking that they sit down with the rate book and figure out how much a particular person's insurance was costing. We were thinking of some kind of touchstone to get various degrees, so it would have the maximum impact on the consumer's buying.

Mr. MERTZ. Yes, and understand we don't mind the idea of that impact. We would like to see that impact felt. We think one of the major purposes of insurance rating according to design would be lost if the public didn't get the message. We sincerely think they will get the message through advertising. If it turns out they don't, we will be very amenable to working with anybody who wants to work on it to see that they do get that information.

Mr. SUTCLIFFE. Would you be adverse to the Secretary of Transportation or the FTC having authority to monitor closely the advertising practices of the companies in promoting their vehicles and their insurance rates?

Mr. MERTZ. This would be the automobile manufacturers?

Mr. SUTCLIFFE. Yes. That is one area you suggested. You said the manufacturers might tout their cars as having a certain degree of property damage susceptibility protection, and lower insurance rates. Some of our advertising messages right now get somewhat garbled in the transmission.

Mr. MERTZ. Yes. Of course I would gather right now—I have never thought it through, but I suppose any interstate advertising by auto manufacturers right now is probably subject to FTC jurisdiction insofar as anything deceptive.

What you are saying is maybe to create an affirmative duty on the part of the manufacturer to provide certain information? You are

not talking about deceptive advertising as much as making them come forward with advertising!

Mr. SUTCLIFFE. It was just a thought? It is not necessary for you to comment.

Mr. MERTZ. My reaction would be I would hope that wouldn't be done unless it was felt it was a last resort, I do think it would be a fair question to ask of the manufacturers when they testify, whether indeed they do intend voluntarily to make information of this type available to the public. I think that would throw a lot of insight into it. If I were in their position I think I would, especially if I got a good rating.

I suppose if I got a bad rating, my car was the worst on the list, I wouldn't be advertising that. But if the ones that get the good rating, the cars that get the good rating, mention this in their advertising, supply it to the dealers, the dealers post it on the walls in the showroom, "Our car got a high rating," that probably would create a desirable effect without having to have someone force a dealer who has a bad rating to disclose this to his customers. That is a little tough on him, to have to tell the customer he has a bad rating or to volunteer it to the customer.

But I will say that we would hope that the public is apprised of this. We have a feeling it will be. I know, for example, in Sweden that one auto manufacturer had a bad rating and reduced its parts prices something like 15 percent overnight in order to get his rating improved. I don't think in Sweden there is any requirement that the dealers have to give all of this information out. I think the word gets around.

I might say the experience on the muscle car situation indicates the word certainly gets around in a hurry. Those young drivers that want the muscle cars, it didn't take more than a week or two before they had the word that the muscle cars were getting rated up 50 percent. And that really hit the sales of muscle cars in a hurry.

Mr. SUTCLIFFE. In your statement, Mr. Mertz, you mention that there is an Achilles heel to the automobile insurance problem, that being property damage loss. Since the auto compensation system is a human system, I would suggest that there perhaps are more than one Achilles heel in the system, and for the record I would like to point out that the two-thirds premium collected for property damage and the one-third premium collected for personal injury, results from a rather marked disparity in the payment of the loss that occurs within the system.

For example, the car damage premium is \$8 billion, the net benefits paid were \$4.6 billion of the \$8 billion in premiums, but the economic loss exceeded the payment by \$1 billion. So we are compensating 83 percent of the property damage loss.

In the bodily injury area, it breaks down at \$6 billion for premium collected; net benefits paid, \$2.4 billion; compensable economic loss, \$6.5 billion; for a 37 percent compensation on the basis of bodily injury.

So to state that the premium cost for insurance is two-thirds and one-third is an accurate statement, but in terms of our present compensation system, that ratio is because we pay much less, or are required to pay much less of the compensable loss as to bodily injury

than we are as to the vehicle itself. And this is what has prompted the statement that we are treating cars and the repair thereof much better than we are treating people and their repair.

Mr. MERRZ. First, in my remark about Achilles heel, I did say cost-wise. In other words, we are saying here is where we are suffering the staggering losses, whereas the bodily injury side, loss-wise, used to be considered the bad boy, but by comparison now we are not losing as much money on that as the damage side.

There is where the dollar outflow is going, even far more than in relation to the premium difference. Also we felt that probably the greatest opportunity for achieving reductions in premium costs, that is, trying to stabilize premiums and bring them down, the greater opportunity for doing it probably lies on the material damage side, for one thing because the losses are bigger, and because, perhaps, it will respond to some physical things like designing the car better, which is not going to make anybody mad. In other words, everybody benefits by that. There is no real controversy.

On the bodily injury side, we acknowledge that if you measure the cost efficiency of the system solely in terms of comparing the net dollars going into the claimants' pockets with the amount of premium that was paid into the other end, that the so-called cost benefit ratio is not as high as it is in the physical damage field, partly because, of course, physical damage has comprehensive and collision which pays off directly without intervention of a lawyer.

Now, although my statement didn't actually cover this, we would certainly agree that there should be, there needs to be a marked improvement in the cost efficiency on the bodily injury side.

We perhaps do not see eye to eye with some on the committee as to how harshly or how sympathetically you should judge the fault system. We think for one thing that to look at it solely from the standpoint of cost efficiency, that perhaps it should not only be looked at from that standpoint. But talking only about the cost efficiency, we are certainly dedicated to improvements of that, and without getting into the whole subject of Mr. Lemmon's paper, I would want to point out that the program we are espousing, the dual protection plan, which does not go as far as S. 945, the no-fault direction, but goes a substantial step in that direction, that program will greatly improve the cost benefit relationship, because roughly 90 percent, or more than 90 percent of the medical expenses and—let me put it this way: More than 90 percent of the cases, injury cases, involve medical expense and wage loss which falls within the first part of the coverage we would mandate through our program.

In other words, we would mandate on every policy enough medical, enough disability coverage, to take care of over 90 percent of the cases, accident cases. This means that those people would be getting that money immediately, on a no-fault basis, they wouldn't have to hire a lawyer to get it, they wouldn't have to go to court, file a suit or anything else.

Obviously if that took place, it would make quite a change in the cost benefit ratio. I can't say precisely how much.

Mr. SUTCLIFFE. With the Senator's permission, one of the written questions to Mr. Lemmon would have involved that exact cost data that he mentions.

Mr. MERTZ. I might say it will also cut down litigation.

I noticed in one of the DOT reports that they pointed out in cases where suits are filed—this is a different way of looking at it—in cases where suits are filed, that one-half of the recoveries are \$3,000 or less. Our program, as far as the amount of first-party coverage we put in the policy, is going to go well above that. So it gives you an idea of how many of those law suits would be obviated under the program we are suggesting. Of course, our program then provides for automatic offer with right of rejection of a catastrophe economic loss coverage that would take those limits up to \$100,000 per person per accident. So for all people who didn't reject that, you would again be provided with a great deal of immediate payment without having to hire a lawyer to get it.

Mr. SUTCLIFFE. On those first-party coverages, does that establish a level of tort exemption?

Mr. MERTZ. The person who is entitled to recover those benefits must set them off against any tort action he may bring.

Mr. SUTCLIFFE. What about if he is sued? If he is a defendant in an action?

Mr. MERTZ. If he is defendant?

Mr. SUTCLIFFE. Yes. And someone else has those first-party mandatory coverages?

Mr. MERTZ. The other person, that is any person who sues, any plaintiff, who is entitled to recover first-party benefits under the policy that we are talking about, whether he be the owner of the car, passenger in the car or pedestrian hit by the car, that person is entitled to those first-party benefits. He automatically would have to offset that amount of those benefits against any recovery he could make in a lawsuit against the third person.

In other words, let's say if his total economic loss fell within the limits of that mandatory coverage we prescribe of about \$8,000 worth of first-party benefits that are mandatory, then he has no lawsuit left for economic loss.

Mr. SUTCLIFFE. His only recovery would be in the intangible loss area?

Mr. MERTZ. Right, and there we have a formula to apply to the less serious cases.

Mr. SUTCLIFFE. That is important, because in Mr. Lemmon's testimony it was unclear as to the exact relationship between the two.

Mr. MERTZ. We definitely would prevent duplicate recovery within the tort system.

Mr. SUTCLIFFE. We will explore that in questions submitted to you. One last question: You have supported S. 976 calling for Federal standards for property loss reduction.

There will be some that will argue that because the States are experimenting on a State-by-State basis with bumper legislation, that we should allow the State-by-State experimentation to proceed without establishing national standards. How would you respond to that?

Mr. MERTZ. Let me say first that I think the State bumper laws have provided, have served a worthwhile purpose. I think they have stimulated action on the part of the auto manufacturers and they have, I think, aided in highlighting this problem and focusing attention on bringing a solution to it.

It may seem to some people that it is uncharacteristic of our association to support anything Federal. I think some people probably prior to today would have thought we would automatically be against anything Federal. That is not the case.

Our position is that the regulations of a given activity or pursuit should be carried on by—in determining which level of government should do it, and I agree with Clay Johnson, we don't think there should be a dual regulation—we think it ought to be carried on by that level of government based on several factors.

No. 1, which government level is best suited. In the first place, is the activity something which can only be sensibly, logically, and reasonably regulated at one level or the other.

Let's take the characteristic of the basic design of an automobile. We are talking about basic design, because when you talk about putting a better bumper on the car you have to consider how you connect it with the frame and that may mean modifying the frame.

Actually in the DOT standard, they have a two and a half mile-an-hour rear capability, but in fact the bumper is not connected to the frame on some cars. It is just connected to the skin of the car. So to get beyond two and a half miles an hour in the rear they will probably have to connect the bumper to the frame, which we think would be a good idea.

Now, since regulation of bumpers inevitably leads to the regulation of the basic structure of the car, we feel there is no way you can design a car on a State-by-State basis. It has to be one car, and basically designed to be sold in all States.

Now, when you get to something like headlight requirements, you might be able to vary them from one State to another. The basic structure of the car, it is just by its nature has to be regulated we think one place, nationally.

No. 2, it requires an agency with a great deal of expertise, a great deal of resources, engineering know-how.

This is an expensive proposition and it probably exceeds the capability of any one State to do the right kind of job and match themselves with the expertise that exists in Detroit.

No. 3, the Federal Government has substantially occupied this field. DOT is regulating the safety characteristics of the cars. It would not make much sense to say DOT should regulate the safety characteristics, and the other characteristics should be regulated on a State-by-State basis, because the two might be in conflict and throw the manufacturers into a dilemma.

No. 4, the States have never regulated in this area, I mean really regulated the design of a car.

So for all of these reasons, we think it is just common sense to do it this way. We think we could take the same arguments and say, conversely, why we support State regulation of insurance. It has been at the State level, many people find fault with certain things that have been done, but it has been regulated there, we think quite effectively. We have never hesitated to criticize the States when they don't perform their functions properly.

But we do not think for example that insurance is something which has to be regulated nationally. Now, people have different views as to whether it would be better regulated nationally or locally. But it

isn't by its nature something that necessitates national regulation in our opinion.

Mr. SUTOLIFFE. Thank you very much.

If we have further questions, perhaps we could submit them.<sup>1</sup>

Mr. MERTZ. We would be very glad to answer them.

Senator HART. In thanking you, let me indicate that prior to the recess we estimated we would conclude by 5 o'clock and I know that Mr. Lemmon was perfectly willing to stay, but I realized also that we have airplane trouble on Friday night getting out of here, and I indicated to him we would place his statement in the record in full.

Incidentally, I should underscore the fact that he recommends or describes S. 945 and S. 946 as unnecessary and unwarranted, and we ought not to give them favorable consideration. We will put that statement in the record in full.

As I indicated to him, such questions as remain, which we think appropriate to ask him, we will write him and he can respond in writing.

And if there are additional questions of either of the two other witnesses, Mr. Mertz or Dr. Miller, we will do the same.

Thank you very much, gentlemen, for your patience.

Mr. MERTZ. Thank you for your patience, Senator, we appreciate it.

(The statements follow:)

#### STATEMENT OF VESTAL LEMMON, PRESIDENT,

#### NATIONAL ASSOCIATION OF INDEPENDENT INSURERS

We appreciate the opportunity to appear before this Committee and testify concerning S-945, S-946 and SCR-23.

NAII is a voluntary national trade association of some 533 insurers<sup>2</sup> of all types, both stock and non-stock, whose membership provides a representative cross-section of the casualty and fire insurance business in America. Our companies range in size from the smallest one-state entrepreneurs to the very largest national writers; they reflect all forms of merchandising—-independent agency, exclusive agency, and direct writer; and they include companies serving a general market and those specializing in serving particular consumer groups such as farmers, teachers, government employees, military personnel, and truckers.

The independent companies have long been recognized as the most competitive and progressive segment of the fire-casualty insurance business. They have originated by far most of the many policy coverage innovations and improvements in the past 25 years. Their aggressive price competition has saved the insuring public more than \$10 billion in premiums in the last decade alone. Our companies have continued to expand the voluntary market availability of automobile insurance at a rate faster than the rate of increase in new vehicle registration, so that currently they are serving more than half the insured motorists in this country.

Our basic position on S-945 can be summed up as follows:

(1) We recognize that certain problems exist in the present system of dealing with the financial consequences of automobile accidents:

(2) Great progress has been made in recent years under this system in expanding insurance protection, through such innovations as automobile medical payments coverage (now carried by 85% of our policyholders), uninsured motorist coverage (carried by some 90% of our policyholders), and the advance payment technique in liability cases;

(3) The remaining problems can be alleviated at the state level by reasonable reform measures which further broaden the scope of protection and streamline the system while retaining its fundamental concept of personal accountability and vital rights of recovery;

<sup>1</sup> See p. 1187 for questions and answers.

<sup>2</sup> 354 members and 179 subscribers to our statistical services.

(4) Imposition of a federal no-fault system governing the automobile accident reparations problem is not necessary and would be contrary to the long-range public interest;

(5) We therefore respectfully urge that S-945 be not favorably considered by this Committee and the Congress.

#### SCOPE AND COMPLEXITY OF THE PROBLEM

Our Association welcomed the comprehensive DOT investigation of the automobile accident injury reparations system and we so testified during the hearings of your Committee in 1968 on the legislation authorizing that investigation. We recognized that an exploding vehicular population and spiraling medical and disability costs were imposing tremendous new strains on the liability system and the insurance system serving it. We noted that the system has been in a continual state of evolution since its origin, and anticipated that the DOT study might well point up the need for further improvements.

The results of that study, to which our companies and Association contributed a number of valuable inputs, suggests the following as the major areas of concern by DOT:

- More widespread compensation of basic economic losses;
- Meeting the special problem of the catastrophic loss;
- Improved speed and efficiency;
- Better distribution of loss dollars by size of claim;
- Encouragement of rehabilitation;
- Reducing court congestion.

NAII is dedicated to improvement of the system in all these areas, and is actively promoting state legislation aimed at that goal. Our proposals for reform are embodied in our Dual Protection Plan.

Dual Protection calls for inclusion in all private passenger liability policies of at least \$8,000 of medical/disability coverage per person per accident (\$2,000 medical/hospital/funeral; \$6,000 income loss; \$4,500 for loss of essential services by non-wage-earners<sup>1</sup>) payable regardless of fault, to the insured and family, guest passengers and pedestrians. Every insurer would also be required to offer optional catastrophe economic loss coverage to the insured and family to take over if and when the basic limits coverage just described is exhausted, and pay medical/disability benefits (regardless of fault) up to a limit of at least \$100,000 per person per accident.

Losses paid by the first-party insurer could be shifted to an at-fault third person or his insurer, thus preserving the important principle that those who present the greatest hazard to others should carry the largest share of the total loss.

Among its cost-reducing features the Plan (1) prevents duplicative recovery of economic losses under both the first-party coverage and the tort liability system; (2) requires recognition in wage loss awards of the fact that no income tax is payable, and (3) prescribes prima facie standards for determining tort damage awards for pain and suffering in the less serious liability cases. The Plan also calls for mandatory arbitration of small claims, and for certain other steps to streamline and improve the system. We are furnishing more details concerning Dual Protection for this Committee's information.

Our program constitutes a major response to the criticisms highlighted by DOT and this Committee. Well over 90% of the medical/disability losses suffered in auto accidents fall below the minimum limits of basic economic loss automatically included in each policy under our Plan. Thus, the vast majority of accident victims will get instant payment of basic economic losses regardless of fault and without necessity of litigation. Those motorists and motoring families needing and desiring the optional catastrophe coverage of at least \$100,000 per person would also be assured of it, and the premium cost involved would be nominal.

While our Plan will thereby deliver much broader benefits to more people more quickly—and with a substantial improvement in the operating efficiency of the system—it also preserves the vital principle of personal accountability for negligence, the equitable rule of loss-bearing based on fault, and the important right to recover tort damages for pain and suffering—subject only to prima facie standards in smaller cases. Costwise, the basic features of our program are intended to stabilize or reduce the premiums for the average motorist.

<sup>1</sup> Income loss coverage subject to a minimum limit of 85% of lost earnings or \$750 per month; non-wage-earner coverage subject to a minimum limit of \$12 per day.

As indicated by Secretary Volpe in his report and testimony to the Congress, the DOT study has pointed up the wisdom of exercising caution in deciding exactly what steps should be taken in the way of reform measures.

Even the massive data and findings piled up by DOT do not lead automatically to "easy solutions" of the auto accident compensation problem, according to Mr. Volpe.

"Much legitimate uncertainty" exists as to "how far and how fast the public wants or is willing to go in changing the reparations system".

The price and cost implications of any major change in the system are "unknown and essentially unknowable".

The complexity of the problem, and the existence of honest disagreement among informed people as to what remedial measures are best, point to the wisdom of healthy experimentation and change at the state level, rather than federal action abruptly over-turning the whole auto reparations system nationally.

We strongly concur with Secretary Volpe's admonitions on those points.

#### BASIC OBJECTIONS TO S-945

We submit that adoption by the Congress of S-945 would constitute a form of "over-kill" of problems which are capable of adequate solution at the state level within the framework of the present system.

The existing fault liability system governing auto accidents and most other forms of accidents rests on several basic principles that developed out of many centuries of hard-won experience by society. One is the principle of personal accountability—the duty of each citizen to use reasonable care not to injure his fellow man, and if he does wrongfully injure him, the responsibility to respond in damages. Liability insurance was created as a means of enabling a person to better meet that responsibility if it arises.

We ask: Has this long-recognized principle of human behavior now become unsound, or outdated, as applied to auto accidents? If so, upon what basis?

The only arguments we have ever heard advanced for abolition of this vital principle are based purely on expediency—the supposed need to eliminate at all cost the expense and the time factor involved in administration and enforcement of the principle.

We know this Committee will examine carefully the grave propensities of Congressional action abolishing this principle, as proposed in S-945. We believe it would constitute a serious blow to driver safety motivation and to traffic law enforcement for this Congress to enact measures which embody the principle that henceforth, except where they commit "catastrophic harm" some 100,000,000 American motorists are to be freed of all personal accountability to their injury victims for negligence on the streets and highways.

Such a move could easily be interpreted by the public as a declaration that it no longer really matters who is at fault in the great mass of auto accidents. If so, it could well lead to a deterioration of driver attitudes and weakening of police enforcement efforts, and to a tragic increase in deaths, injuries and property damage.<sup>1</sup>

<sup>1</sup> In "Automobile Accident Costs and Payments: Studies In The Economics Of Injury Reparations" (U. of Michigan Press, 1964) the report of the comprehensive study of automobile accidents in Michigan, at pp. 91-92, the value of the fault system in aiding in the traffic law enforcement function is recognized. It is there pointed out that: "Therefore, an innocent party to an accident has a private incentive to supply police with any information which would tend to throw fault upon other parties. In the absence of the tort claim incentive, many motorists might think it more sporting to have no memory of fault-implying aspects of the accident."

That report goes on to state the following conclusion:

"From these considerations, it appears that tort law probably furnishes important incentives to avoid involvement in accidents involving injury to others, and to avoid conduct which will be charged as negligent, even if it does not unfailingly punish the guilty and limit its reward to the completely innocent."

"None of the other reparations systems appears to furnish an equal incentive in this direction. Workmen's compensation doubtless furnishes an incentive to employers to minimize injuries to their own employees, but their incentive to minimize injuries to others by their employees must reside elsewhere. As for life insurance, social security, and public assistance, the effect of injuring another on one's own taxes or insurance premiums is infinitesimal."

"Therefore, any proposal to eliminate the tort remedy from any area of accidents would call for a close examination into the sufficiency of the other incentives to injury avoidance. At the same time, it cannot be said that minor changes in the tort pattern, by increasing or decreasing the damages, or by relaxing or tightening the negligence standards, are likely to affect significantly the pressure which the ordinary citizen presently feels to avoid injuring others."

These consequences would be most unfortunate, especially since extreme measures such as this are not in our opinion necessary. Those criticisms of the present system which have substance can be alleviated by state legislation which greatly increase the coverage, speed and efficiency of the system while preserving the vital concept of personal accountability.

#### PAIN AND SUFFERING

A second major respect in which S-945 constitutes an "over-kill" of the problem is its proposed abolition of all right of recovery of pain, suffering and other general damages except where "catastrophic harm" has been inflicted.

Congressional action sweeping away this vital right of the American public would fly squarely in the face of what several reliable indicators show to be the wishes of most of the people. A substantial majority if the public when fairly polled on the subject have stated that they are not willing to give up their right of recovery for pain and suffering *even if it would reduce insurance costs*.<sup>1</sup> This being so, even a larger majority in our opinion would oppose the loss of that right under a program like S-945, which we believe can only increase insurance costs.

#### PRIMACY OF AUTO INSURANCE COVERAGE

Another highly important public policy concept which S-945 would abrogate is the principle that *motoring should pay its way* in our society. With minor exceptions the bill would make the prescribed auto insurance no-fault coverage secondary to all other sources of medical and wage loss benefits. The injured party could not collect a penny from his auto insurance until and unless he had exhausted every bit of available benefits from employer sick leave and wage continuation plans, union benefit funds, Blue Cross, Blue Shield, group and individual accident and health coverages, Medicare and/or other social insurance programs. Auto insurance would be permitted to be primary only if one of those other plans, coverages or programs expressly chose to make it primary—a conjectural possibility, to say the least.

Making the auto coverage excess over collateral sources would create a host of vexing practical problems including difficulties in ascertaining collateral benefits in connection with rating and with claim investigation, with resulting delay and confusion. Most important of all, though, there are basic public policy reasons why the auto insurance system should be the primary source of recovery for automobile-inflicted injuries, as recommended by Secretary Volpe in his report and testimony to the Congress.

Motoring serves a utilitarian function or a pleasure-producing function, or both, for those who engage in it. But it likewise saddles serious hazards and burdens on our society in the form of deaths, injuries, noise, traffic congestion, air pollution, consumption of natural resources, and so on.

Sound public policy dictates that to the fullest extent possible those who engage in an inherently dangerous or socially burdensome pursuit should bear the full costs of that pursuit—including the costs of all attendant safeguards and measures necessary to minimize or underwrite the damage it inflicts on others. It would be unfair and unwise to shift the costs away from those who engage in the pursuit and thereby subsidize it.

Thus, there is absolutely no justification for shifting a substantial part of the cost of auto accidents away from the activity of motoring and burying it in the cost of non-auto insurance systems, or employer wage continuation programs, or social insurance programs like Medicare. It would be no more justifiable than to relieve industrial polluters of the responsibility for installing adequate pollution control devices, and forcing the general public to pay the entire costs of protecting themselves from the consequences of that pollution.

Keeping the full costs of a hazardous, burden-producing pursuit like motoring squarely on the shoulders of those participating in it also provides at least one form of disincentive against unreasonable *over-use*. Gross over-use by some citizens of the automobile already creates serious problems in America—such as the worsening congestion of our inner cities and arterial highways by the glut

<sup>1</sup> In the 1970 national survey by Market Facts, Inc., of a large, representative cross-section of the public—the *only* survey which has determined both the attitude *and* the *understanding* of the interviewees concerning the concept of tort damages for pain and suffering—a resounding 70% of those expressing an opinion were opposed to the idea of eliminating recoveries for pain and suffering, *even if it reduced the cost of automobile insurance*. In the massive Michigan Law School survey of auto accident victims noted at footnote 1, some 76% of those interviewed believed tort recoveries should include damages for pain and suffering.

of commuter-driven cars which could and should be replaced by mass transportation. To shift a major portion of auto accident losses from auto insurance to outside benefit sources, as S-945 would do, is a step in the wrong direction which would tend to compound both the traffic congestion problem and the safety problem. We are certain that Secretary Volpe, who has major responsibilities in both the mass transportation and safety areas, had these considerations in mind when he gave support to the principle of primacy of auto insurance in any auto reparations reform programs developed.

#### FAIR ALLOCATION OF THE LOSS BURDEN WITHIN THE AUTO REPARATIONS SYSTEM

A closely related question is that of how the total loss burden within the auto reparations system should be distributed among the different classes of insureds and types of vehicles. One of the virtues of the present system is that, basically, those who present the greatest sources of hazard to others end up carrying the largest share of the total losses. We strongly believe this principle should be preserved.

Here again we find S-945 reversing long-standing rules, and decreeing that what has always been considered right is now wrong and what was wrong is now right. The innocent victim must insure himself against the losses negligently inflicted on him by the wrongdoer, and bear most of the additional insurance cost of that peril.

One area where this question is highlighted under S-945 is its attempt to deal with the fact that commercial and public vehicles as a group present a greater third party liability hazard than private passenger vehicles.

S-945 tries to handle the problem by creating a concept of "larger than ordinary" vehicles and a formula approach by which DOT would assign to those vehicles a percentage of the net economic losses sustained by occupants of other vehicles. This would mean that in individual cases large vehicles—which could include vehicles ranging in size from privately owned campers to double bottom trucks—would be paying part of the losses of others in accidents which were in no way the fault of the driver of the larger vehicle.

In short, this bill like all drastic no-fault measures will thrust loss burdens onto the shoulders of people who don't deserve to bear them. Once you depart from the principle that loss burdens should follow the pathways of fault, you do gross injustice to one group or another.

And once you start down that wrong road, how can you justify stopping with auto accidents? If the extrahazardous categories of motorists are now to be largely freed of their responsibility to their victims and the victims must bear that loss burden, consistency would dictate that surgeons be immunized from liability for negligence in the operating room, and that manufacturers of foods, drugs, automobiles and all other products be immunized from liability for defects causing harm to the consuming public.

Carried to its ultimate conclusion, this philosophy of no responsibility would require freeing industrial polluters of all responsibility to stop polluting, and "solve" that problem by forcing every citizen to buy himself a gas mask.

#### STATE, NOT FEDERAL, ACTION INDICATED

The final major objection—and perhaps the most basic—which we wish to interpose to S-945 is that adoption of a Federal auto accident reparations program is unnecessary and unwarranted, and would be contrary to the long-range interests of the American public. The proper situs for remedial action is at the state level.

Not only would this bill strip the states of jurisdiction over the whole field of law governing the rights and responsibilities of the public in motor vehicle accidents, but it would move the seat of regulation of our business from the state capitals to Washington, D.C.

As one example of the kind of "regulation" S-945 contemplates, it will force every auto insurer to accept and insure for life virtually any motorist who walks in the door, regardless of driving record and potential hazard. In reviewing applications, insurers will no longer be able to consider factors such as fraud, misrepresentation, illegal enterprises and activities, habitual drunkenness or dope addiction, or a long-standing record of accidents and convictions. A company apparently will just have to keep issuing lifetime policies to more and more applicants until and unless it can prove to a regulator that it is on

the verge of insolvency—which then may well be too late to take preventive action.

This provision—so consumer-oriented at first glance but so serious in its implications—is an example of what can result from precipitate attempts to “cure” the intricate problems of insurance regulation or of auto accident reparations nationally with one stroke of a pen. It can do irreparable damage to a whole industry, and backfire against the long-range public interest as well.

It is perfectly true that mistakes sometimes occur in state legislatures, too. But when that happens it has a relatively limited geographical impact on the public and on the insurance business before it is corrected.

A complete, instantaneous upheaval of the existing reparations systems of 50 states as proposed in S-945 is an entirely different matter. Radical country-wide experimentation of this kind would be at best a dangerous gamble with the public interest—and all the worse because it is an *unnecessary* gamble.

There are some institutions and fields of activity or enterprise which by their very nature must be regulated nationally. But the legal system governing the rights and responsibilities of persons involved in auto accidents is not one of them. Nor is the insurance operation serving that system.

No case has been made for Federal usurpation of this field.

It has been suggested that this step is necessary because motoring sometimes involves interstate travel.

If this reasoning were sound—and we submit that it is not—consistency would require that it be applied to scores of other activities, institutions and fields which have every bit as much of an interstate flavor or impact as motoring:

It would follow that because the graduates of local schools scatter to the four corners of the country to pursue a career the entire educational system of this country should be federalized.

It would follow that because citizens traveling from one state to another are subject to varying local criminal laws, the Congress should forthwith replace all those statutes with a rigid federal code.

It would likewise follow that the Congress should take over and rigidly control under a federal master plan virtually every other local institution, business transaction, legal right of action, pursuit and activity one could name, because *all* have interstate aspects or impact.

Another allegation made in support of federal action is that the states cannot be depended upon to respond promptly and adequately to meet public needs and wants. We've heard this suggestion many, many times before—in fact, it has accompanied every bid for federal invasion of state jurisdiction since this nation's founding. If it had prevailed, all state and local government would long ago have been swallowed up, and the daily lives of every citizen would be regulated, lock, stock and barrel, from Washington.

The members of the state legislatures, are after all, elected by the same people who elect the members of this Congress. I'm sure they would insist, with justification, that they are every bit as close and well attuned to the needs and wishes of their constituency.

The record will show that once a need for change has been clearly manifested and opposing viewpoints fairly presented and debated, the state legislatures are quite capable of moving forward with sound, progressive measures.

Look at the record of the states in enacting legislation promoting universal availability of uninsured motorist coverage.

Look at the record of the states in broadening coverages and liberalizing eligibility requirements for those in the assigned risk plans.

Look at the record of the states in closing the gap on the insolvency problem.

Look at the record of the states in the passage of competitive rating laws.

Look at the record of the states in enacting laws and regulations governing cancellations. As of this date, some 41 states have taken such action.

Where the auto reparations system is concerned, we would point out that various proposals for reform—including our Dual Protection Plan—were introduced in a majority of states this year. To suggest, as have some advocates of federal action, that because those states have not taken decisive action as of today they are “foot-dragging”, seems to be an unfair and unjust accusation. After all, the U.S. Department of Transportation, under the direction of this Congress, has been engaged in a massive two-year, \$2,000,000 study of the problem, the final report of which was not made public until a scant seven weeks ago.

One might ask: What was expected of the states—to jump the gun and revolutionize their liability systems by guessing at the unseen final findings and recommendations of DOT? And had the 50 states acted precipitately—or even if they now act precipitately—without carefully weighing the final DOT report, would not that \$2,000,000 study have been a waste of time and money?

As acknowledged in the DOT report itself, there are many pivotal aspects of this problem which remain highly controversial if not imponderable.

The most basic is: How far and how fast does the public really want to go toward no-fault? The DOT itself, even after making its public attitude surveys, isn't certain. Other surveys, too, show that while the public obviously would welcome lower premiums, a majority also wants the party at fault to be held accountable, and they don't want to give up damages for pain and suffering, either.

How can we find the best measures for reconciling the many different public desires in this area—some of which seem rather inconsistent? Isn't the safest, most sensible approach to do as Secretary Volpe has urged—to go to the state level where the existing reparations systems operate—close to the problem and close to the people—to test our measures which seek a proper balance between the fault and no-fault concepts—and thereby to evolve on an orderly basis a system of sound, up-to-date state laws?

We submit that this is the best, and, in fact the only reasonable approach to so complex a problem.

One form of healthy experimentation is already going on in a majority of states, and it is our companies who are providing the leadership. An increasing number of companies are automatically including quick-pay protection covering basic medical expenses and wage loss with all their auto liability policies. Public reception of this voluntarily-expanded coverage has been excellent.

As an extension of this experimentation, NAII is actively promoting Dual Protection, calling for state legislative reform which strikes a reasonable balance between the many proposed solutions to this problem. We have already described the major features of that program, including the fact that it is designed to stabilize or reduce bodily injury insurance premiums.

Of course, the major opportunity for effecting auto insurance premium savings lies on the property loss side of the picture, where most of the money is now being expended. NAII and its companies have been devoting a great deal of effort and resources in research into the underlying causes of the spiral in collision and property damage losses and means of reversing that spiral. This subject is fully treated in our testimony on S-976, The Motor Vehicle Information and Cost Savings Act.

We have seen nothing to evidence a hue and cry by the public at large for adopting a compulsory federal no-fault program. In our opinion, the public *does* want improvement of the auto accident reparations process, but not at the price of sacrificing what is worthwhile in the existing system. The safest and surest way to determine precisely *what* form of reparations system best satisfies most people's needs is to do what has been done with success on so many occasions in the past—to use several states as laboratories to test out in the crucible of real-world experience some of the reasonable reform concepts being advanced. Our Association is committed to this approach, and we intend to work for timely action by the states to this end.

#### POSITION ON S-946

Just as we believe the states should be left with the task of improving the automobile accident reparations system, the NAII holds that implementation of group automobile insurance plans is a matter for individual state determination. We see no justifiable need for Federal interventions in this area, and thus we must oppose S-946.

The state regulatory climate already allows for innovative activity in this area. Half the states are experimenting by having approved several forms of group programs. In addition, six states in current legislative sessions have introduced bills authorizing such programs, and a number of other states have indicated no opposition, provided the programs comply with their respective state laws.

It is noteworthy, perhaps, that states which have approved programs of group auto insurance have nevertheless continued the retention of fictitious group laws or other laws designed to prevent the formation of fictitious groups for purposes of insurance. Through various tools at their disposal (e.g., rating laws, unfair trade practices acts, examination laws and other measures), the states are in

an eminently better position to determine whether groups of individuals are entitled to special insurance treatment.

Each state is familiar with its own problems in the areas of marketing availability of insurance, protection against unfair discrimination, the tailoring of programs to best meet the needs of the public at the local level, etc.

The states, moreover, are much better geared to see that the insurance market is not controlled by plans under which the giant companies could well run the smaller insurers out of business.

#### CONCLUSION

In view of the foregoing, we respectfully submit that S-945 and S-946 are unnecessary and unwarranted, and should not be favorably considered by the Congress.

We believe it would be against the long-range public interest for the Congress to take specific action either in the area of auto accident reparations or in the field of group automobile insurance merchandising.

Should the Congress elect to act, we urge that it not go beyond the broad approach embodied in SCR-23.

#### STATEMENT OF ARTHUR C. MERTZ, VICE PRESIDENT AND GENERAL COUNSEL, NATIONAL ASSOCIATION OF INDEPENDENT INSURERS

We appreciate the opportunity to appear before this Committee today and testify concerning S-976, the Motor Vehicle Information and Cost Savings Act.

I am Arthur C. Mertz, Vice President and General Counsel of the National Association of Independent Insurers, a voluntary trade Association of 533 companies<sup>1</sup> of all sizes and types—stock and non-stock—which serve more than half the insured motorists in America. With me today is Dr. Patrick Miller of Cornell Aeronautical Laboratories, Inc., who will report on the status of research being conducted by CAL on our behalf which is pertinent to the legislation before you.

We appear today to give our support to S-976 in its basic objectives and provisions. Subject only to certain limited qualifications and affirmative suggestions which I shall note in the course of this statement, we endorse these major features of the bill:

Clarification and broadening of DOT's authority to include promulgation of property loss reduction standards, including bumper standards.

Establishment of tests and procedures to produce comparative damage-ability data on production models of new cars, and furnishing of that data to DOT for dissemination to the public and the insurance business.

Determination by DOT of feasibility of similar procedure relative to vehicle safety testing and data reporting.

Broadening of DOT standards for state vehicle registration laws to include title provisions.

Establishment of further incentives for states to adopt and implement periodic vehicle inspection laws.

In regard to the provisions of S-976 which call for expansion of the state vehicle inspection systems to cover certain post-crash situations, we support the underlying safety objectives, but urge further research and experimentation before determining whether these should become part of the mandatory standards.

Our general endorsement of S-976 arises out of our profound concern over the rapid upsurge in auto material damage losses, which must be borne by the consumer in the form of higher insurance premiums. S-976, in calling for vehicle design and bumper improvements to minimize damage, should help make possible the ultimate stabilization or reduction of auto material damage insurance rates. As will be pointed out, NAIH as an advisory organization is working diligently to develop means of evaluating the impact better bumpers and other design improvements will have on losses, so as to aid our companies in giving appropriate rate recognition to those improvements.

#### THE PROPERTY DAMAGE SPIRAL AND FACTORS UNDERLYING IT

As a backdrop to my comments on the specific provisions of S-976, it might be helpful to refer briefly to the worsening underwriting picture on automobile material damage coverages, and some of the factors behind it.

<sup>1</sup> 354 members and 179 statistical subscribers.

During the decade 1959-1969, the average property damage<sup>1</sup> loss incurred by all our companies on private passenger autos increased about 100%. In other words, the severity of property damage loss involved in the typical, everyday automobile crash, as measured by the size of the average PD claim, about doubled.

What is even more disturbing is the fact that the annual *rate* of increase in average loss severity has been rapidly accelerating: Of that aggregate 100% increase between 1959-1969, only 29% occurred in the first half of the decade (1959-1964) while 71% of it occurred in the latter half (1964-1969). Thus, the rate of increase more than doubled in the past 5 years. We believe these alarming trends in our companies' average losses are a fairly reliable indicator of trends for the whole industry.

Although premium levels have been raised from time to time, the loss spiral has outstripped them. This is evidenced by the fact that loss ratios—the ratios that losses incurred bear to premiums earned—have risen substantially during the same 10-year period.

Between 1959 and 1969, the average loss ratio on PD for all stock companies, reported in Best's Aggregates and Averages rose from 65.6 to 81.8—up almost 25%. Their average loss ratio on collision went from 60.2 to 75.9—up almost 26%. Notwithstanding more than a 10% reduction in the expense ratio for those lines during the same 10-year period, their combined losses and expenses in 1969 produced an 11.0% underwriting loss on PD and a 4.7% loss on collision coverage.

Meanwhile, all mutuals reported in Best's saw their average PD loss ratio go from 70.6 to 90.2—up almost 28%—and their collision loss ratio go from 57.8 to 87.6—up almost 52%. In spite of substantial reductions in their expense ratios (7% reduction for PD, and 8% for collision) during the same 10-year period, they suffered a 13.6% underwriting loss on PD and a 10.9% underwriting loss on collision in 1969.

Translating into dollars these percentage underwriting loss figures for 1969, we find that stock and mutual companies combined lost over \$450,000,000 on auto property damage and collision coverages in that year. Adding the results from automobile, fire, theft and comprehensive insurance produced over *half a billion dollars* in aggregate losses on the auto material damage coverages. This compares with about a \$150,000,000 loss on auto bodily injury liability coverage.

It is obvious which side of the auto insurance package now represents the major Achilles heel of our business, costwise. While total earned premium volume for material damage in 1969 was only about 20% greater than the premium volume for bodily injury, those material damage premiums produced well over *three times* the amount of losses!

What cost ingredients account for these staggering losses?

A year and a half ago, in testifying at the Senate Antitrust and Monopoly Subcommittee's hearings on the auto repair problem, we identified four major factors underlying the auto material damage spiral:

Speed, horsepower and "high performance" cars;

Increases in repair garage charges;

The spiral in automobile prices and prices of crash repair parts;

The extreme vulnerability of today's automobiles to costly damage even in low-speed accidents.

There has been some improvement in the first area since 1969. Largely because of the leadership shown by one of our member companies late in that year in instituting substantial but statistically-justified surcharges on "muscle" cars—followed by other companies—the harrowing horsepower race of two years ago was aborted, permanently, we hope. A valuable lesson learned from this experience was its demonstration of how effective the insurance rating mechanism can be in providing a disincentive for the design, promotion and use of vehicles proven to constitute an extraordinary hazard to the public.

#### REPAIRSHOP LABOR RATES

Repair garage charges for labor have continued to rise, as evidenced by Enclosure 1. In the decade 1960 to 1970 the average hourly rates in the 13 large cities covered by this exhibit increased about 90%. Of the greatest significance

<sup>1</sup> Property damage rather than collision coverage losses are used because the PD figures are in no way influenced by presence or absence of deductibles or by changes in the percentage of policies containing deductibles. However, average collision losses also increased greatly during the same decade, and the rate of increase accelerated in the last 5 years of that decade.

is the fact that 65% of that overall increase occurred in the latter half of the decade and only 25% in the first half.

#### PRICES FOR NEW CARS AND REPLACEMENTS PARTS

In our October 1969 testimony we showed that between 1965 and mid-1969, the new car list price on a Plymouth Fury increased 11% and that of a Chevrolet Impala and a Ford Galaxie rose 10%. Meanwhile, the list prices on the eight major components most commonly replaced in collision repairs rose 20%, 22½% and 36½%, respectively—two to 3½ times as fast as the new car prices. This disparity had special significance to our business because about 85% of our property damage/collision claim dollars go for *repairing* vehicles and only 15% in payment of "total losses".

Enclosure 2 brings those price trends forward from mid-1969 to April 1971. You will observe that during the past year and a half, the increases in list prices for these new cars and for their major crash replacement components bear a much closer relationship to each other than before. This tends toward a more consistent pricing pattern, but we now find that the prices both for new cars and for crash parts—each a major cost ingredient of our material damage insurance losses—are increasing at an accelerating rate.

Not only have the manufacturers' list prices for parts been climbing rapidly, but the *effective* prices for those parts at the repairshop level have been going up even faster, due to the decline of real parts price competition at that level. The widespread disappearance of repairship discounts on crash parts in recent years was disclosed by NAII in our Senate testimony in 1969, supplemented further by testimony of one of our members.

These revelations, we believe, played an important part in bringing about the pending Federal Trade Commission investigation into the whole crash-parts distribution and pricing system in America. We and our companies have been cooperating in that investigation, and earnestly hope that it will lead to remedial steps opening up the parts distribution system to effective competition and improved cost efficiency. Here, we believe, lies a fertile area for great potential savings to the consuming public.

In the meantime, the staff of our Association is maintaining a continued watchfulness over auto crash parts price trends. We feel we owe a duty to the policy-holding public to do so. Our watchdogging in this area recently proved beneficial when we noted and brought about the correction of errors in several published parts manuals substantially overstating the prices of bumper face bars. Considering the vast number of replacement bumpers purchased by our business on behalf of our insureds, the savings to the consumer on this one item should be substantial.

Another avenue we are pursuing is a study of the feasibility of a crash repair research center for advancing the technology and improving the efficiency of the crash repair process in America. Recently, we sent a 4-man team to England and Sweden to examine the crash research facilities there. The favorable report they brought back has encouraged us to pursue this avenue further, and we hope soon to complete a more detailed study into the practicability of such a center in this country. I personally am of the belief that if properly conceived and operated, this sort of facility could prove highly beneficial not only to our business but to the auto manufacturers, the crash repairshops and the consumer as well.

#### IMPROVEMENT OF AUTO DESIGN

The most critical area, costwise, and the one on which we have focused primary attention, is auto design as it affects damageability. This is of course one of the prime subjects dealt with by S-976.

Our 1969 testimony before the Senate investigation of the auto repair problem was accompanied by a listing and analysis of many common design features which made modern-day cars unnecessarily vulnerable to damage and costly to repair. We especially decried the utter lack of functional bumpers, and urged that if the manufacturers would equip cars with bumpers that could withstand everyday, low-speed traffic mishaps, the motoring public would reap immense savings. Subsequently, one of our large companies has announced and widely advertised its offer to give a substantial collision insurance premium discount on cars equipped with bumpers capable of withstanding a specified barrier crash, front and rear, without damage. Other companies have followed suit.

Beginning during the same Senate hearings, our industry's safety arm, the Insurance Institute for Highway Safety, presented filmed reports of its low-

speed crash tests, which dramatized the gravity and costliness of vehicle damage occurring in mere 5 and 10 MPH barrier crashes.

Those 1969 Senate auto repair hearings and the chain of ensuing events—including the issuance last month of DOT's first bumper standards—have signaled a major turning-point in the crusade for safer, saner cars. Damageability considerations generally, and bumper technology in particular, have now been thrust up to the forefront of attention by the auto manufacturers in their design planning. Indications are that the manufacturers are now devoting extensive research efforts to bumper technology and damage minimization, and we are encouraged by these efforts. Equally important, this issue has also been thrust up to the forefront of public attention, which should give encouragement to the manufacturers and to the government that the public is *ready* for safer, more practical car design features.

#### DOT PROPERTY LOSS REDUCTION AND BUMPER STANDARDS UNDER S-976

The initial bumper performance levels set by DOT—and specifically the 2½ MPH rear bumper requirements—have fallen short of what had been anticipated and hoped for. This standard is, as a first step, an improvement over the status quo, but progress certainly should not stop there.

One of the reasons cited by DOT for requiring only a 2½ MPH (barrier) rear bumper capability on 1973 model year automobiles is its conclusion that a 5 MPH capability "would involve extensive structural redesign without a commensurate increase in safety." These initial bumper standards are of course expressly keyed to *safety* considerations, since the Motor Vehicle Safety Act of 1966 does not expressly empower DOT to give weight to vehicle damageability factors. S-976 will close that gap in DOT's jurisdiction. We support such a move.

DOT having been charged with the duty of setting vehicle safety standards, the authority to give weight to damageability factors as well should follow as a natural corollary. An automobile is an integral piece of machinery. While safety considerations must always be paramount, as S-976 properly provides, major design changes should be viewed in the context of damage minimization as well. Both objectives are highly important from a public interest standpoint, and as Dr. Miller will point out, they are not basically incompatible. It is only logical that the same agency that regulates one essential aspect of auto design should regulate the other, as contemplated by S-976.

A subsidiary question presented by S-976 is whether it is desirable to spell out specific minimum bumper performance requirements in the statute itself, as the bill now does in paragraph 125(c) on page 5, or whether to leave such technical specifications for DOT to prescribe. We believe the wiser approach is to avoid statutory specifications and give DOT the responsibility for such determinations. The choice of the *best* bumper or other design standards, under all the circumstances, involves the interplay and balancing of a great number of factors including engineering, statistical and economic considerations. This determination we believe should be the function of an administrative agency like DOT. We would therefore suggest that paragraph 125(c) on page 5 of the bill be deleted and that paragraph 125(b) be broadened to make it clear that property loss reduction standards shall include bumper standards. We also suggest that it be spelled out that the Secretary shall not only "promulgate" but shall periodically revise and update all such standards, to make it clear that the overall objective is timely, progressive improvement of design—as expeditiously as is feasible in the light of the minimum lead times reasonably needed for the manufacturers to effectuate the changes.

#### VEHICLE-TESTING AND INFORMATION-REPORTING UNDER S-976

Section 5 of S-976 provides that by July 1, 1972 DOT shall promulgate procedures under which all manufacturers must test production models of new passenger motor vehicles for comparative susceptibility to damage in collisions at "normal" speeds. The feasibility of similar tests for determining the comparative risks of injuries and death is also to be determined by DOT.

Results of such tests must be reported to DOT. DOT is to make them available to the public and to auto insurance companies, and is ultimately to advise the Congress on the extent to which our industry is utilizing such information in the determination of premium rates.

We support these provisions of Section 127.

There is one provision of the same section, however, whose deletion we respectfully urge. It is paragraph (b) (3) on pages 8 and 9 of the bill, requiring

automobile dealers to provide comparative insurance cost information to prospective car buyers.

This requirement would in our opinion thrust an extremely difficult if not impossible burden and responsibility on auto dealers, most of whom are neither equipped nor qualified to provide such detailed insurance information to the public. It would appear to require them to amass, interpret and keep currently posted on an immense amount of complex, constantly changing rate data. Doing so without being licensed as an agent would also probably be in conflict with the insurance laws of each state.

No such provision as this is really necessary, in our judgment. We can safely assume that those manufacturers and dealers whose cars have a favorable insurance standing will broadcast general information to that effect to the public, without being forced by statute to do so. For details on the comparative rates of the various insurance companies and groups on the many different makes of cars, the car-buyer can and should turn to his agent or insurance company.

Subject to that one suggestion, we endorse section 127 of the bill. More than that, I want to emphasize that NAI as a qualified rate advisory organization is preparing to be of aid in every way possible in enabling its companies to give appropriate premium rate recognition to cars with improved bumpers and other damage-reducing design changes—just as soon as they have credible data on which to base such action.

For some time now we have been studying ways and means of developing the kind of data the companies will need in order to classify and rate cars according to damageability. We recognized at the outset that, if possible, a method should be found to rate the new, improved car models *at the time* they initially enter the marketplace. That, of course, is the time when premium rate variations will have their greatest significance to the buying public.

To this end, after preliminary consultation and exploration with Dr. Thomas Manos, Professor of Engineering at Detroit University, in mid-1970 we commissioned Cornell Aeronautical Laboratories, Inc., to conduct research on our behalf into a subject of inquiry never previously probed: Can the analytical engineering process, or a combination of that process and a minimum amount of crash testing, be a useful and valuable tool for predicting the damageability characteristics of different vehicles and design features?

The encouraging results of that research to date will be described by Dr. Miller of CAL. As we indicated in our original announcement of that project, it is our intention to make its work product available to the auto manufacturers, to DOT, this Committee and other interested legislative and governmental bodies. DOT has already made informal inquiries into the progress of this project. We would hope that when completed, the CAL research will prove of interest and value to DOT in conjunction with the new responsibilities it will be assigned under section 127 of S-976, relative to developing damageability testing procedures for production models of new cars.

It should be noted that use of these tools for advance projections of vehicle damageability characteristics will not obviate the desirability of also collecting appropriate experience data on the various vehicle makes and models once they are out on the highways. The latter will among other things provide a means of verifying and if necessary adjusting the advance projections as experience indicates. This avenue is currently being explored by the major segments of our industry.

#### STATE VEHICLE REGISTRATION, TITLING, AND INSPECTION REQUIREMENTS

Our final comments pertain to those provisions of S-976 dealing with the Federal standards for state vehicle registration and title laws, and for state vehicle inspection programs.

We urge that paragraph (b) of section 501, on pages 15-16, be amended so as to provide that the Secretary of Transportation, in promulgating standards for state registration and uniform certificate of title programs, may consider the Uniform Vehicle Code and Model Traffic Ordinance provisions, but is not bound by them, as the bill now seems to require. We consider the Uniform Code and Model Ordinance to be valuable tools in the field of traffic legislation. Nevertheless, we do not believe as a matter of policy that the work product of any private or semi-private organization should by Federal statute be automatically mandated upon all the states as required legislation. The National Committee on Uniform Traffic Laws and Ordinances is composed of individuals drawn both from governmental agencies and business and professional organizations, including our own Association. While its work product certainly deserves consideration by DOT in connection

with its standards for state vehicle and traffic legislation, it should have only advisory weight and not binding effect.

The remainder of Title V of S-976 would call for the broadening of existing standards for state vehicle inspection programs, and for the adoption of additional incentives to the states for adopting and further implementing such programs.

Let me first reiterate our long-standing support for any and all measures which can effectively operate to increase the level of safety of vehicles on our highways. For many years our Association and its companies have devoted a great deal of time and millions of dollars annually in the traffic and vehicle safety effort, both directly and through affiliated organizations such as the Insurance Institute For Highway Safety which derive major support from us.

As a corollary to this general position, I also want to make it clear that we fully share the desire of this Committee and the sponsors of S-976 to do everything reasonably possible to assure that vehicles sustaining collision damage involving safety-related parts do not go back on the highways in unsafe condition. Indeed, we would be very foolish to take any other position, because every unsafe vehicle on the highway presents not only a personal hazard but a potential insurance hazard.

We therefore wholeheartedly agree with the safety objective involved. The question is: How can that objective best be achieved? By a requirement that all vehicles involved in crashes where safety-related parts may be damaged undergo state-supervised inspection following repairs—proposed in S-976? Or by a requirement instead that the garage or body shop making the repairs certify as to the safety of those repairs? Or by some other means?

We do not know that answer to this question, nor have we found a clear-cut answer in any research study that has come to our attention.

The one study we have seen—the June 1969 Report by Southwest Research Institute—does demonstrate how latent damage to safety related parts can sometimes occur in collisions. It suggests that it would be desirable to have reinspection of vehicles following collision repairs. But it also indicates that to do so would require a more stringent procedure than is now used for periodic vehicle inspection. And, it proposes a certification procedure by repair shops in lieu of inspection where no periodic inspection requirements are in force.

Periodic motor vehicle inspection, although an important and laudable concept, has also proved one of the most complex and difficult in actual implementation. In some of the states that adopted such programs immediately after the Safety Acts of 1966 became operative, complaints and opposition over practical problems encountered have lead to introduction of legislation to repeal the inspection laws. Such repealers have generally been forestalled, but several programs were amended to limit the number of items required to be inspected.

In the light of these practical considerations, we would respectfully suggest that the bill authorize and direct DOT, before taking any action extending the vehicle inspection standard to cover the post-crash problem, to make an immediate and comprehensive study of that whole problem and the best means for alleviating or minimizing any safety-related hazards. This research should include evaluation of results in states that have tried the post-crash inspection procedure, and might also include DOT sponsorship of experimental pilot programs in one or a few states.

In essence, what we are suggesting is that this subject be treated in somewhat the same manner as paragraph (d) of section 125 of the bill treats the subject of testing procedures for manufacturers in determining the injury potential of various passenger vehicle models. The objective of each concept is sound, but in each case more hard facts are perhaps needed about the practical feasibility of various methods of accomplishing the objective, before a standard is decided upon.

#### CONCLUSION

In conclusion, we wish to commend this Committee and the sponsors of S-976 for having identified and highlighted what is by far today's most serious source of spiraling losses and rising auto insurance premiums and for having proposed legislation aimed at that problem. We believe enactment of S-976, with the modifications we have suggested, would serve the interests of the American consuming public. If your Committee should desire any further particulars as to any of the points we have raised, we will be glad to furnish them, and to cooperate in every other way possible.

Dr. Mill is with me, and with the Committee's permission we would now like to present his testimony.

CHART 3 -- PLYMOUTH FURY III

STATEMENT OF PATRICK M. MILLER, PH. D., HEAD, STRUCTURAL DYNAMICS SECTION,  
TRANSPORTATION RESEARCH DEPARTMENT, CORNELL AERONAUTICAL LABORATORY,  
INC., BUFFALO, N.Y.

I am here today to present information on the vehicle damage study at Cornell Aeronautical Laboratory that is being sponsored by the National Association of Independent Insurers. In addition, I would like to make some comments concerning the relationship between designing structures for vehicle damage reduction and for passenger safety or protection.

Before proceeding with a discussion on the vehicle damage study, perhaps some background information would be helpful to the Committee. Cornell Aeronautical Laboratory is an independent, non-profit, scientific organization wholly owned by Cornell University. The Laboratory, as an independent research organization, has participated in various scientific investigations. One of the most notable activities has been in the area of automobile research where substantial contributions have been made during the past 20 years. With recent increased emphasis on automobile safety, research in this area has expanded dramatically during the past few years. Indeed, research directed toward providing occupant protection during automobile crashes constitutes the most significant and important efforts within the present automobile research projects. The U.S. Department of Transportation is the major sponsor for these projects which include, for example, studies related to automobile structural crashworthiness, underride guards for heavy vehicles, development and testing of inflatable occupant restraint systems, development of computer models for simulating both the automobile and its occupants during various crash situations, development of an accident reconstruction model, and the investigation and analysis of accidents in the Western New York area.

It was principally the automobile safety research efforts that provided the impetus for our becoming interested in the problem of automobile damage during low speed collisions. From a structural point of view, there is a close relationship between the structural requirements during low speed collisions and the structural performance needed to provide for occupant protection during the higher speed impacts. Indeed, if consideration is given simultaneously to both problems, structural requirements designed to reduce vehicle damage could result in corresponding improvements related to occupant protection.

Dr. William Haddon, President of the Insurance Institute for Highway Safety, recently appeared before this Committee and referred to a statement of mine which essentially indicated that there is no apparent incompatibility between designing vehicle structures for occupant protection, while at the same time, providing for vehicle damage reduction during the low speed collisions. I would like to take this opportunity to reinforce this point but to present the arguments in a slightly different manner.

It is true that approximately 10 percent of the total number of accidents result in injury to automobile occupants. However, the greatest percentage of accidents occur under low speed impact conditions. It is my feeling that the low percentage of injury producing accidents results primarily from the low severity associated with a large number of accidents rather than from any optimum design on the part of the automobile structure. In fact, it is quite likely that the occupant response during low speed collisions is completely independent of the vehicle structural response.

Shown in the slide are the deceleration-displacement curves recorded in the passenger compartments of two 1970 Chevrolets while impacting a rigid pole barrier at speeds of 5 and 10 MPH, respectively. Films for these crash tests will be shown later in the discussion. At Cornell, crash test vehicles may be impacted into either flat or pole barriers. We feel that the pole barrier, which produces a concentrated loading on the structure, is probably more representative of real world accident conditions. As shown in the slide, the average decelerations recorded during both tests, that is, at 5 and 10 MPH, were nominally near 2 g's. To put this in perspective, it should be recalled that we normally function in a 1 g deceleration environment.

The American 4000 lb. experimental safety vehicle, under development by the Department of Transportation, permits a 6 g deceleration response during collisions up to speeds of 10 MPH. Although the specifications have not yet been finalized, because of dimensional considerations, deceleration values up to 10 g's will most likely be permitted for low speed impact conditions with the proposed 2000 lb. experimental safety vehicle. I know of no individuals who have advanced technical arguments that take exception to either of these two limits that have been specified for these experimental safety vehicles.

Incidentally, present vehicles when impacting flat barriers exhibit deceleration responses nominally near 6 g's during 5 MPH collisions. The higher deceleration loads result for the flat barrier test condition because all of the frontal sheet metal is contacted and crushed during collision.

Shown in the slide is the relationship that different values of a uniform deceleration will have on the collapse distance required for energy absorption. As shown, a uniform 2 g deceleration results in 5 inches of total collapse at 5 MPH and 20 inches of collapse at 10 MPH. On the other hand, the 6 g limits shown for the experimental safety vehicle would result in 1½ inches of collapse at 5 MPH and 6½ inches of collapse at 10 MPH. The advantages of the higher deceleration limits are readily apparent in terms of reducing vehicle damage because the bumper could be placed a reasonable distance away from the body sheet metal.

The relationship between vehicle crush or collapse and occupant response has been considered by many investigators. It has been well documented that unrestrained occupants can benefit from crush properties of the structure only if they are located sufficiently close to the vehicle interior that they will contact the interior before the vehicle motion has stopped. This phenomenon where the occupant contacts the interior during the structural collapse is called ride down. If ride down does not occur, unrestrained occupants will contact the vehicle interior with a velocity essentially equal to the impact velocity of the vehicle. D. E. Martin and C. K. Kroell of the General Motors Research Laboratories in a 1967 SAE paper (No. 670034) considered this problem and concluded that the occupant spacing from the interior must not be greater than one-half of the total vehicle crush before any benefits from ride down can occur. Thus, for the 1970 Chevrolet tests illustrated earlier, ride down could benefit the occupants only if they were spaced not more than 2½ inches behind the instrument panel during the 5 MPH collision and not more than 9 inches during the 10 MPH collision. Since these limits are not realistic in terms of vehicle interior design, it is extremely doubtful that the vehicle crush characteristics have any effect on the injury potential of unrestrained occupants during the low speed impacts.

The low speed collision situation is probably not much different with restrained occupants. All restraint systems have some slack, or lost motion, and a certain minimum velocity change will be required before the slack is taken out of the system and loading is produced on the occupant. Occupant velocity changes relative to the inside of the passenger compartment of approximately 5 MPH are required to remove the slack from such systems. Thus, it is even doubtful that restrained occupants can realize any benefits from the structural properties during these low speed collisions.

The advantages of the higher deceleration limits as they affect the potential for occupant protection at higher impact velocities are somewhat more subtle. The structural problem related to providing occupant protection is concerned with absorbing the vehicular kinetic energy associated with impact speeds usually much higher than 10 MPH. The kinetic energy of a vehicle increases as a square of its velocity. For example, the kinetic energy of a vehicle in a 40 MPH collision is 16 times greater than that of a 10 MPH collision. Now, if we give up 20 inches of vehicular collapse distance to absorb 1/16 of the energy, that is, the kinetic energy equivalent to a 10 MPH collision, then 15/16 of the kinetic energy must be absorbed in the remaining distance between the occupant and the impacted obstacle. This means that in the velocity range where injuries normally occur, either higher severely decelerations must be imposed on the passenger compartment or serious intrusion into the passenger compartment will take place. Consequently, a 6 g rather than a 2 g deceleration response means that the difference between 20 inches and 7 inches, or slightly over one foot is made available for energy absorption during higher speed, injury producing accidents. It is within this latter context that I see the two problems directly related and strongly feel that an increase in the strength requirements to alleviate the vehicle damage problem would also result in a corresponding improvement for restrained occupants during higher speed impacts. Therefore, what is needed for reductions in both property damage and occupant injuries are automobiles that have increased strength in the forward part of the structure.

Now I would like to present some information on the National Association of Independent Insurance (NAII) vehicle damage analysis project. The objective for this study is to determine the feasibility of using mathematical analysis as a tool in determining the damage susceptibility of automobiles. The fact that this is a feasibility study should be emphasized.

Last spring, NAAI contacted Cornell Aeronautical Laboratory concerning the possibility of implementing a vehicle damage study. Their purpose was to determine what approaches might be employed if one was to evaluate the damage susceptibility of a wide range of vehicles under a number of different impact conditions. One approach, quite obviously, would be to purchase a large number of vehicles and then subject each vehicle model to the various test conditions. When all possible test conditions are considered, it soon becomes apparent that this approach— if continued year after year with all classes of vehicles—would be an extremely time consuming and expensive proposition.

A possible alternative approach would be to develop an analytical model that could be used in conjunction with limited experimental testing to eventually accomplish the same general objective. It should be noted that the intent in developing such an analytical model was not to replace the need for conducting controlled tests, but rather to greatly limit the number of vehicle tests that would be required.

Another benefit of such a model would be that it could identify the contributions that various vehicle components might make in terms of reducing vehicle damage. For example, the effect of changing the structural properties of the bumper could be quickly evaluated by a computer run without resorting to the fabrication of a vehicle and subsequent testing. Likewise, the effects of structural changes for other components could be quickly and economically investigated through such computer runs.

For this feasibility study, specific impact conditions were chosen, that is, 5 and 10 MPH impacts into a rigid pole. The investigation was limited to the front and rear structures of a 1970 full size Chevrolet. The pole impact condition rather than impact into a flat barrier was selected for two reasons:

- (1) The pole produces a concentrated load and, consequently, a more severe loading condition on the structure and;
- (2) This test condition is believed to be somewhat more representative of real world conditions. It is indeed unlikely that cars will impact flat surfaces where the loads are uniformly distributed over the front or rear of the vehicle.

Of course, if this initial investigation was successful, the same techniques could be generalized to include other vehicles and different impact conditions at some later date.

For this study, a rather simplified mathematical theory was used to analyze the vehicle structure. It was felt that if this approach was not satisfactory, a more sophisticated or comprehensive theory could be employed at a later time.

A computer model was developed for the front structure. This computer program considers the basic vehicle components that are shown schematically in the slide. Illustrated are the hood, fenders, radiator and hood latch bracket and the front bumper. In the computer program, a distinction is made between the hood latch bracket and the fenders-radiator structure. In addition, with the Chevrolet, the bumper is divided into upper and lower sections and this feature is considered in the computer program. Also shown schematically on this slide are arrows indicating the direction and position of the forces that would be imposed by the pole onto these structural components.

Precise measurements were made on the vehicle structure. These data provide the input for the computer program. The program essentially solves mathematical equations for each of these idealized structural components. The solution to the mathematical equation is the force-deflection characteristics for the various components. These characteristics are shown in the slide. Also shown is the sum of these forces which represents the expected overall structural characteristic of the vehicle. The area under this total force curve represents the energy that the structure will absorb for a given collapse distance.

We know that for 5 MPH, the vehicle structure must absorb about 3000 ft.-lbs. of kinetic energy while at 10 MPH the structure must absorb about 12,000 ft.-lbs. Areas which represent the equivalent of these respective energies are mapped out on the slide. At the bottom of the slides, collapse distances of 5 inches and 14 inches are indicated for the 5 and 10 MPH collisions, respectively.

A similar computer program was developed for the rear structure of the vehicle. Both programs were exercised to determine the degree to which the vehicle would deform for 5 and 10 MPH impacts with a rigid pole. The output of the program is the force deflection properties of the structure and the degree of external vehicle collapse.

Controlled tests to validate these computer simulations were conducted. Now we will show some of the film taken from these test results. It should be noted that the only purpose of these tests was to validate the mathematical model.

The first scene is a real time view of the vehicle impacting the pole barrier at 5 MPH. Incidentally, a 5 MPH speed is equivalent to a normal jogging speed. The vehicle was operating under its own power during all of the tests. This scene is followed by a high speed photographic view taken from an angle of 45 degrees in front of the vehicle. For this test condition, the pole penetrated 5 inches into the vehicle structure. This value is the same as that predicted by the computer program. This view shows the structural collapse from underneath the vehicle and here we see the damaged vehicle after the 5 MPH collision.

The same vehicle was impacted at 5 MPH backwards into the pole barrier. This collision resulted in 5 inches of structural collapse which is the same as that predicted by the computer model. Shown in this scene is the vehicle after the 5 MPH rear collision.

An identical vehicle was then subjected to 10 MPH front and rear tests. Although I am showing the frontal impact test first, actually the rear collision was performed prior to the frontal collision. The reason for this is apparent when we see that the radiator was severely damaged in this test. This is a frontal view taken at a 45 degree angle, which shows the severe collapse of the structure. The underneath view dramatically shows the collapse of the radiator support structure. About 17 inches of exterior deformation was measured after the test. This compares with a value of 14 inches that was predicted by the computer model.

This sequence shows the 10 MPH rear impact. The underneath view shows that substantial deformation of the fuel tank took place. The tank was loaded with a fluid that demonstrates some of the characteristics of gasoline. It should be noted that even though the tank was severely deformed, no leakage of fluid occurred.

We have summarized on a slide the comparisons between the predicted values for exterior deformations and the exact values determined as a result of the four tests. It is worth noting that the analytical predictions were reasonably correct for the 5 MPH impacts. However, for the 10 MPH cases, they tended to predict values for the deformation that were somewhat lower than that recorded in the tests. These results for the 10 MPH collision were further investigated after the tests. As a result of this investigation, the modeling of the hood and radiator support structure has been refined. Similar refinements were also made for the trunk region of the rear structure.

We are now in the process of checking the validity of the refined program. For this purpose, a 1969 Ford has been purchased. A Ford was selected for these tests because it represents a structure that is quite different from that of the Chevrolet. Measurements have been made and the input data are being prepared for the computer. It is expected that the computer analysis will be completed before the end of the month. At that time, we will conduct 10 MPH front and rear tests on the 1969 Ford. These results will be compared to those predicted by the computer.

At the present stage of the study, our tentative conclusions are:

- (1) Within the scope of this program, the feasibility of predicting vehicle damage has been established. That is, the present model is highly accurate at 5 MPH and is expected to be refined to be accurate for the 10 MPH collisions. When this latter phase is completed, a valid model will be available for this type of impact condition.

- (2) An attempt should be made to generalize these limited results to other situations, that is, to consider different impact conditions and different types of vehicle designs. The result of this generalization would be a computer program that would allow various potential users the flexibility to quickly and economically analyze various vehicle damage situations.

At this point, I would like to briefly summarize how such a generalized analytical model could be used as a tool in evaluating the low speed structural performance of automobiles. An important application for this model would be in reducing the number of full scale tests required. For example, a vehicle might be impact tested at 10 MPH and mathematical analysis used to determine how the vehicle would perform at other impact velocities. Furthermore, usually only minor structural differences are evident between many of the automobiles produced by the same manufacturer. The mathematical model could be used to determine the effects that these small differences would have on performance without requiring full scale tests of all vehicles produced by a single manufacturer.

We plan to issue a final report covering the project early this summer. Copies will be available from either the National Association of Independent Insurers or Cornell Aeronautical Laboratory. Upon request, copies will be furnished to Congress, automobile manufacturers, governmental agencies and other interested parties.

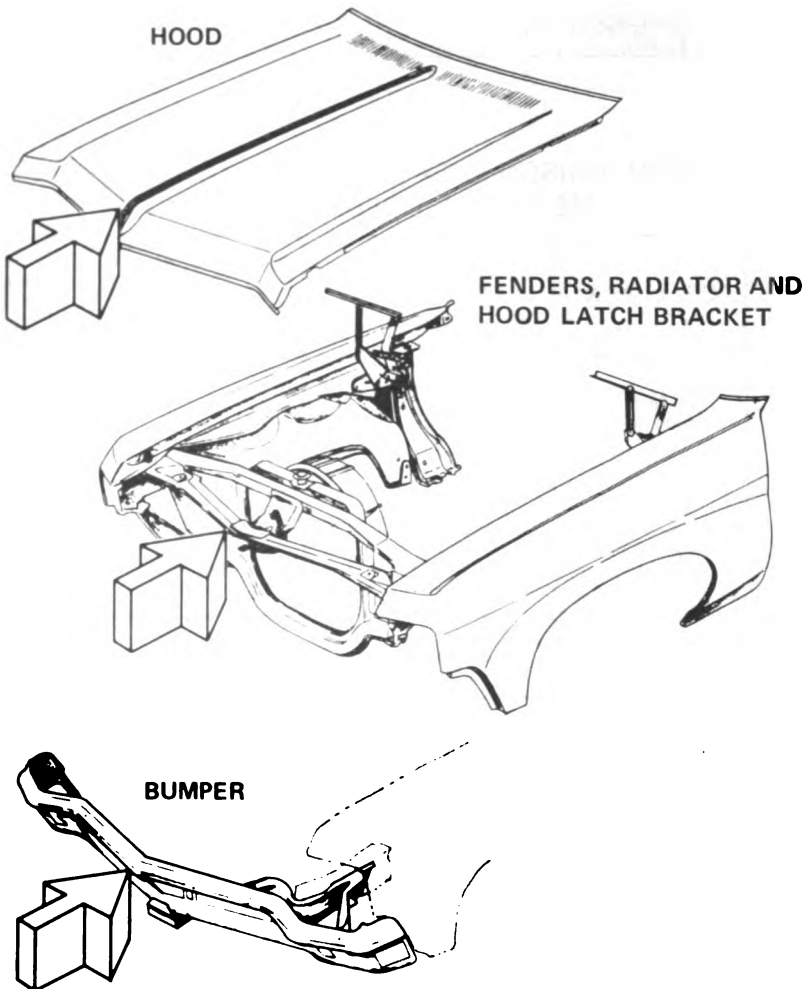

**COLLAPSE DISTANCE (IN INCHES) REQUIRED FOR  
DIFFERENT UNIFORM DECELERATION LEVELS**

IMPACT SPEED	DECELERATION LEVEL		
	2 g	6 g *	10 g **
5 MPH	5 in.	1 2/3 in.	1 in.
10 MPH	20 in.	6 2/3 in.	4 in.

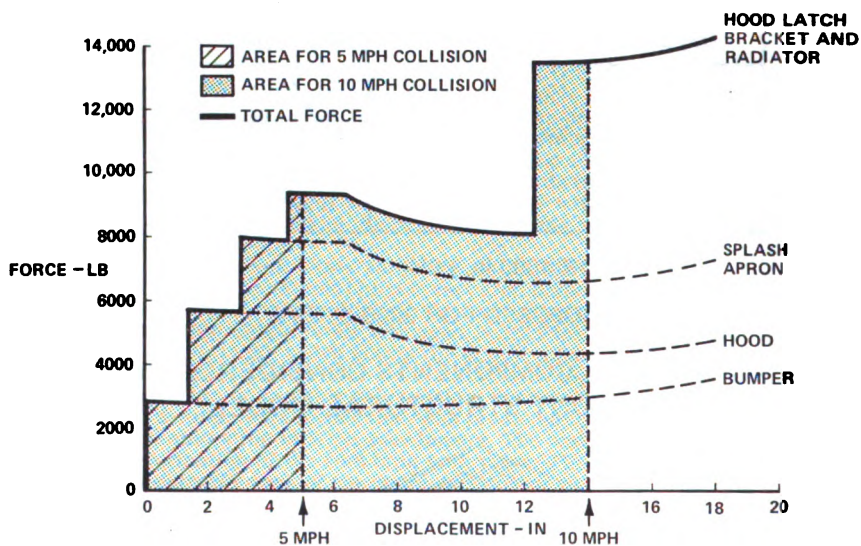

\* LIMIT FOR 4000 lb. ESV

**VEHICLE COMPONENTS CONSIDERED IN  
FRONT STRUCTURAL MODEL**

# FORCE-DEFLECTION CHARACTERISTICS FOR FRONTAL COLLISIONS

## COMPARISON BETWEEN PREDICTED AND MEASURED DEFORMATION

COLLISION	PREDICTED DEFORMATION (IN)	MEASURED DEFORMATION (IN)
5 MPH FRONT	5.8	5.0
5 MPH REAR	4.5	4.2
10 MPH FRONT	14.0	17.5
10 MPH REAR	10.5	16.0

(The questions and answers referred to on p. 1163 follow:)

NATIONAL ASSOCIATION OF INDEPENDENT INSURERS,  
Chicago, Ill., July 23, 1971.

HON. PHILIP A. HART,  
U.S. Senate,  
Committee on Commerce,  
Washington, D.C.

Dear SENATOR HART: Attached is our response to your questions based on the testimony presented to the Senate Commerce Committee.

We hope these answers enable you to clarify the record and better understand NAI's Dual Protection Plan.

Many of the judgments and opinions needed to respond to your inquiry will now be verified or disproved in the real world market place. We are pleased to note that Illinois has adopted a program which is consistent with the major provisions of Dual Protection. Such experimentation is, in our judgment, in the best interest of the insuring public.

Sincerely,

VESTAL LEMMON, *President.*

Enclosure.

#### RESPONSE TO SENATOR PHILIP A. HART'S INQUIRY ON NAI'S TESTIMONY

*1. In describing the Dual Protection Plan, you state that "cost-wise, the basic features of our program are intended to stabilize or reduce the premiums for the average motorist."*

*(a) Does your plan preserve tort liability?*

Answer. NAI's Dual Protection Plan does preserve an individual's vital rights under the existing tort liability system.

*(b) In a successful suit by plaintiff are the first party coverages paid by the plaintiff's insurer set off against the judgment against the defendant, and/or is the successful plaintiff's insurer subrogated to the rights of the plaintiff to the extent it has paid first party benefits?*

Answer. Under NAI's Dual Protection Plan, the insurance company issuing the basic automatic-pay coverage immediately pays the injured party (named insured, family member, guest passenger or pedestrian) medical and disability benefits as set forth in the contract, regardless of fault. The insurer paying these benefits is entitled to reimbursement from a legally liable third party. Reimbursement will occur, either by (1) mandatory intercompany arbitration in all cases in which the tort defendant is insured by a company licensed in the enacting state, or (2) by the subrogation procedure in other cases.

The Plan does not make any specific provisions either requiring or preventing subrogation under the optional Catastrophe Loss Coverage. This is left to the individual insurance company to decide whether to provide for a right of subrogation, subject to the laws of the particular state.

The Plan thereby retains the means and opportunity to allocate the costs of insurance in relation to the variations in hazards among different risks, individually or by class grouping, and retain equitable distribution of insurance premium costs among risks. This preserves the basic concept that motoring should pay its own way, and that those who represent the greatest hazard should bear the largest share of the total premium burden.

*(c) What are the limitations on intangible loss recoveries under your Dual Protection proposal?*

Answer. One of the cost savings and stabilizing features of our program is the standard for pain and suffering awards in the less serious cases. The Plan proposes that such standard apply to certain cases where liability claims are lodged or suits filed against motorists who are covered by liability insurance policies containing basic automatic-pay coverage.

Under those standards, awards for pain and suffering, mental anguish and inconvenience would be limited to an amount equal to 50% of the first \$500 of reasonable medical and hospital treatment expenses and 100% of such expenses over \$500.

While differences of view may occur as to the propriety of distinguishing, in degree of recovery, between medical losses of a nominal amount and those that are more substantial, the recent studies indicate some existing lack of proper balance between nominal medical losses and recoveries for attendant intangibles in comparison to medical losses of more substantial amounts. NAI's Dual Pro-

tection Plan does make a distinction in the allowances for intangibles between nominal medical losses and those of a more substantial amount.

There would be no limitations in cases of death, permanent total or partial disability, disfigurement or loss of limb or other special circumstances shown to involve actual substantial pain and suffering.

We believe the public wants and is willing to pay for reimbursement for these so-called intangible damages from a guilty driver. This has been demonstrated by several comprehensive public attitude surveys.

(d) *Please explain in detail the basic features of your program?*

Answer. Attached as Addendum 1 is an explanatory memorandum of NAI's Dual Protection Plan.

2. *On Page 8 of your prepared statement, you state "We believe S. 945 can only increase insurance costs."*

(a) *You have estimated that your Basic Protection Plan will cover 90% of the total economic loss. It has been estimated that S. 945 would cover 99.6% of the economic losses resulting from automobile accidents. The Basic Protection Plan puts certain limitations on pain and suffering recovery. S. 945 prevents a person from suing another party unless that person has suffered permanent injury or in the language of the bill "catastrophic harm". In other words, there is minimum overlay of liability on the first party mandatory policy coverages. Please explain in detail why S. 945 would increase insurance costs and compare the projected cost factors of S. 945 with the Basic Protection Plan projected cost factors.*

Answer. The quotation from which this question flows is lifted from a portion of a sentence and, as is so often the case in such approach, obscures the complete thought.

As we have pointed out in our statement, S. 945 would increase insurance costs for several reasons which are not even related to benefits or compensation. The present tort liability system contains deterrents which aid traffic law enforcement and traffic safety programs. On Pages 6 and 7 of our statement and in a subsequent question we indicate that the deterrents of the fault system provide a strong incentive to avoid accidents and conduct which may be charged as negligence. S. 945 substantially eliminates these deterrents and consequently will increase costs.

Furthermore, S. 945 would require an insurance company to accept and insure for life every licensed driver who makes an application to that company unless the company can prove that such writings would cause its insolvency. The underwriting process is designed to protect the majority of responsible motorists of normal driving habits from the extra hazardous losses of the irresponsible drivers. This process provides substantial savings to the majority of today's drivers and if eliminated as is done in S. 945, would increase costs for insurance.

The Public Law authorizing the "comprehensive study and investigation of the existing compensation system for auto accident losses" does, by implication, recognize that the information to be developed will involve a degree of estimation in any conclusions reached. The limitations of using data or estimates derived from diverse sources, as a basis for conclusions, are referred to repeatedly in the report to the Congress and the President made by Transportation Secretary Volpe.

The two percentages quoted in this question are not comparable nor necessarily in conflict and yet are, to a substantial degree, compatible. The lesser percentage figure refers to the number of losses while the greater one refers to dollar amounts. The problem involved in attempting to compare unlike data is indicated in the illustration given on Page 1 of the final report made by Transportation Secretary Volpe.

The concepts upon which the Dual Protection Plan is erected and those underlying S. 945, differ. The Dual Protection Plan is a realistic approach to solving the problem of basic compensable economic loss while S. 945 tends to go beyond this and include the "societal" economic loss. The distinction between these concepts is discussed on Pages 4 through 7 of the final report made by Transportation Secretary Volpe.

The thrust of the existing insurance reparations system and the Dual Protection Plan is to deal effectively with the compensable economic losses. On the other hand, S. 945 will tend to encourage recoveries on a broader scale. This seems to be recognized as a fact in Sec. 4 of S. 945 which states "In such cases there may be a recovery for economic loss in excess of that received, or entitled to be received under this act, as well as for other elements of damage."

Since existing insurance systems, as well as the Dual Protection Plan, are designed to evaluate and compensate for automobile economic loss, and not encourage recovery for amounts in excess thereof, whereas S. 945 will permit such recovery it seems clear that the assertion that S. 945 will lead to an increase in insurance costs has a factual foundation.

(b) *For every dollar collected under the Dual Protection Plan, how much money would be returned to policyholders in the form of direct benefits, and please indicate just what those benefits are.*

Answer. It is not possible to predict with certainty the exact "benefit-to-premium" ratio that would be produced by our Plan, or *any* proposed new reparations plan including S. 945. However, we can state with confidence that under Dual Protection a far greater portion of the bodily injury insurance premium dollar would be returned to policyholders in direct claim payments than at present.

There are several reasons for this belief. Under Dual Protection, the policyholder (or any one of the other categories of eligible claimants) will be paid up to \$2,000 for medical expenses and \$6,000 for income loss immediately regardless of fault. Since no lawyer will be needed to collect such benefits, these amounts will be recovered in full by the claimant. As pointed out earlier, well over 90% of the medical/disability losses fall below these limits, so that the aggregate savings in "transfer costs" affected by this feature of Dual Protection will be very substantial.

As to the matter of intangible damages, if the claimant is satisfied that all he is entitled to is the amount determined by the statutory formula, he should have little need or occasion to resort to litigation or incur attendant legal expenses. In cases where his economic losses exceed the basic no-fault coverage, and/or where the seriousness of his injuries indicate he is entitled to greater intangible damages than provided by the formula, the injured party retains the right to bring suit if not satisfied with a settlement offer by the tortfeasor or his insurer. But even when litigation does so occur, the "transfer cost" of the system in delivering benefits will be smaller than at present, because the fee charged by the lawyer can fairly be based only upon the amount he *actually recovers* for the claimant—from which is excluded the no-fault economic loss benefits already collected directly and in full by the claimant himself.

It must be kept in mind that under *any* system of compensating for auto accident losses—first party, third party, "fault," or "no-fault"—it is necessary to incur the costs of determining that an accident has occurred, that injuries were sustained, and to develop the factual data for properly evaluating the alleged losses in dollar amount. Under a third party recovery system it is necessary, of course, to take an additional step and establish the source of fault. However, the bases for establishing fault are contained in the several laws pertaining to this item and are relatively simple to apply.

Controversies, when they do arise, generally involve a difference of opinion as to the dollar value of loss rather than the question of the existence of fault.

A first party recovery system, unless it embodies a fixed dollar benefits—which can compound inequities alleged under a third party recovery system—will not eliminate the controversies as to dollar amount evaluation of losses, nor the costs incurred in arbitrating such matters. As a matter of fact, it is possible that a first party recovery system can accelerate the costs of evaluating losses, depending on the factors for evaluation to be considered.

Because of these several unknowns, it is speculative whether *any* first party recovery system, including both S. 945 and the Dual Protection Plan, will markedly alter the costs of establishing the equitable dollar value of individual losses. In other lines of insurance of a first party type, such as workmen's compensation, accident and sickness, hospital and medical, Medicare and Medicaid where, commonly, scheduled benefits are provided, frequent controversies occur as to the validity of a claim for loss or the dollar evaluation thereof.

While the cost of operating and administering any insurance system is important and cannot be ignored there are other factors equally important.

It is our view that the Dual Protection Plan responds to an indicated public desire and need for a loss recovery system that embodies the *potential* for a saving in cost and an improvement in efficiency. In our judgment, it is more forthright to develop a program that meets a public need and operate it in an efficient manner at minimum cost than to speculate on savings based on inadequate data which subsequent events demonstrate cannot be achieved.

(c) *How does the figure in (b) compare with the projected figure for S. 945?*

Answer. For the reasons cited in (b) above a comparison of specific figures is not attainable on a prospective basis. It is possible, of course, to erect mathematical models that will appear to demonstrate the superiority of one system over the other. This can be done quite readily by varying the assumptions inserted in the model. The vice of this approach is that the assumptions may lack validity, or be based on inadequate factual information, or both, with the result that the conclusion may be misleading and impossible of attainment.

In our view, it is preferable and in the best interest of the public, to provide a recovery system that meets their indicated desires and be perfectly honest in stating the areas of uncertainty as to cost, rather than to make promises as to cost that may not, subsequently, be achieved. Secretary John Volpe made the following observation in his statement before the Subcommittee on Commerce and Finance, House Interstate and Foreign Commerce Committee:

"It is also clear that there exists genuine and warranted concern as to the unknown and *essentially unknowable* price and cost implications of any major change in the system, which of course would ultimately affect the cost and quality of service to consumers of insurance."

The best way to determine these costs is through experimentation. Such experimentation will take place since several states have enacted plans with similar provisions.

3. *On the first page of your prepared statement you say that "Independent companies have long been recognized as the most competitive and progressive segment of the fire casualty insurance business." Twelve years ago this month the Senate Antitrust and Monopoly Subcommittee was told that the NAI, according to its bylaws, "believes in competition in all aspects of the business including forms, services, and methods of distribution and price." If the NAI still believes in competition in all of these aspects, why does the NAI oppose S. 946 which would expand methods of distribution and permit group merchandising?*

Answer. Article I, Section 2 of NAI's Bylaws states:

"To carry out its purpose, the aims of the corporation are:

A. To preserve reasonable competition and thereby to encourage and safeguard initiative, enterprise, improvement and development in the insurance industry under such reasonable governmental regulation as is essential for the protection of the public."

This is one of the main cornerstones of NAI's policy. Another, just as important, however, is this Association's support of insurance regulation on the state level.

As stated on Page 17 of NAI's statement, this Association is opposed to S. 946 because we believe the implementation of group automobile insurance plans should be a matter for individual state determination. We see no justifiable need for Federal intervention in this area since the state regulatory climate already allows for innovative activity in this area.

Half the states are experimenting and have approved group programs. Senate 946 would prohibit states from determining the best policy for its residents.

We opposed both S. 945 and S. 946 because we believe the states should be left the responsibility and authority to change or alter the automobile accident reparations system and to oversee the implementation of group marketing programs.

4. *On Page 16 of your statement you ask Congress to adopt Secretary Volpe's recommendation that no-fault reform proceed on a state-by-state basis. Yet, the NAI apparently fails to include in its Dual Protection Plan one of Secretary Volpe's key recommendations. On Page 136 of the DOT's final report, the no-fault system advocated by Secretary Volpe is described as follows:*

"The goal of the system should be that no recovery for any loss of the type covered by the applicable required coverage would be permitted in any private action for damages." The report goes on to say that "no person should recover for intangible losses (pain and suffering) unless he establishes he suffered permanent injury . . . or that he incurred personal medical expenses . . . in excess of a rather high (emphasis added) dollar threshold." Doesn't the NAI Dual Protection Plan contravene this recommendation of Secretary Volpe?

Answer. A review of our testimony will indicate that NAI has not endorsed all of the recommendations made by Secretary Volpe. As our testimony clearly indicates the position of the NAI is that experimentation at the state level is the most appropriate method of testing and evaluating automobile insurance reform.

The phrasing of your question indicates a belief that Secretary Volpe's proposal for reform has been described in final form. However, as can be readily seen, the Secretary's proposal is tentative and approximate in nature. The following excerpts from the DOT's final report illustrate this point:

Page 133 regarding the proposed system:

"It should be emphasized that this is a goal to be achieved over time, not an action blueprint for tomorrow. Moving in stages toward such a goal would allow us to test its virtues and discover its faults, whereby giving us new knowledge that could serve to modify the goal itself."

Page 133:

"The board outlines of such a system are proposed below."

Page 133:

"It should be emphasized that the policy limits and deductibles used in the following description are *basically illustrative*, . . ."

Because of the approximate nature of the proposed system, there would appear to be no reason to either endorse or reject the entire proposal. It would seem that the public interest is best served by more selective judgments and evaluations.

The two quotations cited in the question refer to very different areas. The first quotation which was taken from the first paragraph on Page 136 refers to the problem of duplicate recovery. The Dual Protection program eliminates duplication within the automobile insurance system because monies recovered under the mandatory no-fault coverage under Dual Protection are deducted from monies recovered under tort remedy. In addition, except as to workmen's compensation cases, Dual Protection has been made the primary source of recovery for auto accident losses.

The second quotation cited in the question deals with the recovery of intangible losses. To the extent that Secretary Volpe's proposal does not completely eliminate recovery for intangible losses his proposal is consistent in principle with Dual Protection. His proposal differs in that it refers to a *threshold* type limitation which denies injured parties any intangible damages (subject to certain exceptions) if their medical expenses do not reach a specified level, but allows *unlimited* damages once medical expenses pass the threshold. Dual Protection on the other hand retains the right of every injured party with subject (with certain exceptions) to formula limitations keyed to medical expenses. We believe our approach to this matter is much more equitable than an arbitrary threshold below which one can recover nothing and above which he can recover without limit. We believe, too, that it is more likely to satisfy the public.

5. In the University of Michigan reparations study cited by you on Page 6, the following paraphrased sentence appears at Page 296 and 297: 33% of the defendants surveyed do not know whether or not the plaintiff (injured victim) had received a settlement from the plaintiff's insurance company. How does this failure of the defendant to know whether or not the plaintiff had recovered affect your argument that the tort system preserves personal accountability and has a deterrent effect upon reckless driving?

Answer. The question, as you have stated it, is difficult to interpret. There would be very little, if any, negligence deterrent on the defendant for benefits paid the plaintiff (injured victim) by the plaintiff's insurance company. These would be first party benefit payments under the medical payments or uninsured motorists coverages. This is the position we have always taken and the point we were trying to make with regard to the deterrent effect of a pure no-fault plan.

After studying the pages cited in your question, we suspect you mean the defendant's insurance company. If this is your question, our response would be that we know that the fault liability system governing automobile accident is not a perfect deterrent but it is better than the other existing reparations systems such as workmen's compensation, social security, etc. The authors of the Michigan study recognize this as discussed in Pages 88 through 102. We pointed this in our statement and the footnotes on Page 6 and 7 of that statement.

The 33% figure cited really tells us nothing very probative about the deterrent effect of the fault system; all it tells us is that 33% of a group of defendants assumed that if the plaintiff was entitled to recover, their insurer had paid him or would pay him—which is of course the very reason for carrying liability insurance—to be able to acquit one's responsibilities if liable for negligent conduct.

The primary concern of a defendant is the determination of his guilt or innocence and not the dollar evaluation thereof. Hence, it is not surprising that the

survey referred to in your question indicates that a substantial quantity of defendants are uninformed as to the quantity of settlement affected. This is one of the reasons we question the results of the DOT's Serious Injury Study cited in Question 9.

6. *The Nationwide Insurance Company, a member of your organization, has proposed their own no-fault auto compensation plan. Under the Nationwide plan, is tort liability completely eliminated as between claimants? In what other significant respects does the Nationwide no-fault plan differ from the NAI's Dual Protection Plan?*

Answer. The Nationwide plan does eliminate tort liability. If you would like more detailed information on their program, we suggest you contact them directly.

NAII has never made it a condition of membership that a member company is obligated to support any program or position taken by the entire membership, if that company disagrees with that position. Nationwide has stated publicly that if a particular state wanted a plan such as Dual Protection, it would support our position as a step in the right direction. In some states, it has taken such a posture.

7. *Attached to this letter you will find a copy of a Farmer's Insurance Claim bulletin to all district managers and agents in the Kansas City, Mo., region date June 6, 1970. That letter describes the way in which State Farm Mutual, Allstate Insurance Company, Safeco Insurance Company, and several other large underwriters have tightened their underwriting rules. The Farmer's bulletin concludes:*

*"Naturally this change in the market will result in diverting this potentially unprofitable business towards Farmers. To avoid this eventuality and help sustain our progress toward meeting our 1970 goal of improving our underwriting loss experience, we find it necessary to amend our accident and citation rules accordingly."*

*(a) Does the NAII consider this kind of selective underwriting competition in the best interest of the public?*

Answer. The Bulletin cited in the above question was not attached to your letter. You indicated that it would be sent under separate cover but it has not been received.

This question pre-supposes that the quoted allegation is an established fact. In our opinion, a proper and succinct answer based on general facts known to us, is an unqualified "no." We feel sure that you would concede that any statement made by a company, in communications to staff personnel, in regard to actions taken by any competitors probably reflects only the view of the writer and may possibly contain a degree of bias to which the competitors may not concur. Hence, it is fallacious to accept a conclusion as fact prior to an examination of the validity of statements made and before those accused are given an opportunity to present facts in rebuttal.

NAII feels that the public is best served when companies with various marketing concepts, underwriting philosophies and rating plans are allowed to compete for a "book of business" which is compatible with its corporate objectives and will not jeopardize its financial solvency. The product of such competition is efficiency of operations with lower costs to the vast majority of automobile insurance consumers.

In our judgment, the natural force of competition, although sometimes imperfect for short periods of time, will serve the public far better than any program that would require companies to insure everyone who submits an application. Our reasons are set forth on Page 13 of the statement.

In response to an inquiry from the Federal Trade Commission a few years ago, we made the following general comments about underwriting operational functions and practices. We feel these comments are also apropos to your inquiry.

"Much of the literature referring to 'underwriting' has over-simplified a complex function and has assumed that there exists 'standard underwriting practices' and 'standard underwriting procedures'. The truth is that underwriting practices vary by company, by state or territory, and over time. Underwriting is essentially a fitting or selection process; it attempts to select that group of consumers whose loss potential fits within the exposure contemplated in the rates filed and approved for that company.

"The parameters of the selection process in any one company at any one time are dictated by a complexity of internal and external factors—for example, the

company type, the character and quality of its administration, the financial condition and aims of the company, the broadness or narrowness of the type of consumer the company has elected or is capable of serving, the adequacy of the feasible rate levels for the markets served or selected, legislative and regulatory restrictions on the selection process, the pricing underwriting and marketing practices of competitors for that market, the willingness and ability of management to subsidize or support social, economic or political needs or aims with respect to its market or the total market or new markets and the willingness and ability of management to continue to employ its resources in the industry."

Risks accepted by the industry on a voluntary basis under this process represent upwards of 97% of the insurance industry's automobile liability insurance market. The other 3% is also served by the industry through its automobile insurance plans.

*(b) By these practices are the companies in your association creating a larger residual market and aggravating the availability problem?*

Answer. NAII's member companies have consistently increased their percentage of both the total voluntary and involuntary automobile insurance market. Our companies write well over 50% of the total private passenger market and in 1970 the automobile insurance premium volume of our members increased from \$5,303,142,000 to \$6,196,832,000, or almost 17%. We feel our companies have done more than any other group of companies to alleviate the availability problem and provide protection for the voluntary as well as involuntary market. The following demonstrates the basis for this conclusion.

PRIVATE PASSENGER NONFLEET EARNED EXPOSURES WRITTEN BY COMPANIES REPORTING TO NAII

Year	Voluntary	Assigned risk
1967.....	27, 119, 136	922, 380
1968.....	29, 036, 101	952, 153
1969.....	31, 779, 829	1, 013, 158

1970 statistics are not available at this time.

Since our companies write the largest portion of the so-called residual market, it would certainly not be to their advantage to create such a market.

*(c) Do your member companies consider all moving accidents for the proceeding (sic) year in accepting, rejecting, or rating a new applicant for auto insurance, or do they consider only moving accidents where the driver was at fault? If fault is considered, where does the company receiving the insurance application find out who was at fault?*

Answer. This is a very general question since you ask about certain specific practices or procedures followed by over 350 insurance companies. NAII is an advisory rather than a rating organization. Therefore, we do not maintain underwriting or rating manuals of our companies. Our membership acts independently on such matters and there is no uniformity of practice. Our response must be based on our general knowledge of such procedures.

Generally most "Safe Driver Insurance Plans" used today only charge for accidents but a few may still have a traffic violation factor. The latter are not commonly used, however, and underwriters as well as raters generally consider only the accident record.

Furthermore, at the present time, most Safe Driver Insurance Plans which assign points for accidents try to restrict surcharges to "at fault" accidents. This is done by "exceptions" to the rule which preclude the assignment of points for which the applicant could not have been at fault e.g. lawfully parked vehicle, hit-and-run, etc.

Under a "no-fault" plan there would be no way of applying surcharges solely to accidents in which the insured was at fault or presumably at fault because fault would no longer be determined. At the present time, a majority of drivers are rewarded for their good driving or accident-free records. It is difficult to conceive of an equitable safe driving plan that will reward good drivers under a "no-fault" system. A Safe Driver Insurance Plan based only on traffic violations or accident involvement, would be replete with enforcement problems as is evidenced by the present trend to "accident only" Safe Driver Insurance Plans. In our judgment, to surcharge motorists solely because of accident involvement without determination of fault would prove unacceptable to the public from a long-range standpoint.

8. *In your prepared statement you argue that a first party reparations system would foster reckless driving. This Committee has received testimony that the accident rate in Puerto Rico actually went down when their no-fault plan was implemented. On what basis, then, do you conclude that a first party reparations system aggravates the accident problem?*

Answer. In our judgment, the Puerto Rico Plan has been in effect for too short a period of time to make such a judgment about the effects of such a complex and far-reaching program on driving attitudes and accident involvement. Furthermore, we feel that one cannot properly draw conclusions about the implications of the Puerto Rico Plan on the motoring public of the States because of the different social, economic and political conditions which exist in that commonwealth.

Some of our company representatives who have been directly involved with Puerto Rico have observed that if the decline in accident rate actually develops for this brief period of time, it may well be attributable to several factors unrelated to the new no-fault law.

First, police have investigated claims faster and obtained more information than under the old system because the government is involved with the payments made under the program.

Secondly, our informants point to the very important fact that during the period of time following adoption of the no-fault law there occurred purely coincidentally a "down-turn" of the economy in the United States which reduced Puerto Rico tourism considerably and resulted in high unemployment of many connected with the tourist industry. It is a proven fact that when people cannot purchase as many automobiles and travel as extensively because of unemployment or other factors, the risk environment changes and accident frequency drops.

Similar results may be observed under the fault system of this country. Many companies noticed improved underwriting results in the United States in 1970 and 1971 when the above-cited economic conditions were operative. Some companies are preparing to adjust their rates for this improved accident frequency.

There are many economic factors affecting our business over which we have no control. Historically, it has been observed that in periods when the general economy is lethargic or in a declining phase, our business tends toward greater profitability. Conversely, in an accelerating economy stimulated by inflationary pressures, profits in the insurance business are depressed or non-existent, the degree depending on the severity and length of the cyclical movement.

9. *In your prepared testimony you state that "it would be unfair and unwise to shift the cost away from those who engage in the pursuit and thereby subsidize it." How, then, do you justify preserving the liability system which the Department of Transportation study reports already shift away costs when delivering compensation to seriously injured accident victims? For example, seriously injured accident victims suffer about \$5 billion in compensable economic loss. The present tort liability system pays for approximately \$1.1 billion of that \$5 billion in loss, or 24% of the compensation received. Other sources pay for 58% of the compensation received. If it is unfair and unwise to shift the costs away from those who engage in the pursuit, thereby subsidizing it, what do you propose to do about the way in which the tort system which you preserve in your Dual Protection Plan presently shifts those costs away?*

Answer. We do not believe it is accurate to state, as the question does, that the liability system "shift(s) away when delivering compensation to seriously injured accident victims." Under the present liability system, the right of recovery of an accident victim in tort is a *primary* right, that is, the defendant cannot reduce his liability to the plaintiff by the amount of any collateral source benefits to which plaintiff has access, such as A & H coverage, sick leave, Medicare, etc. Thus, *in delivering the compensation it is designed to deliver in the situations it is designed to cover*, the liability system provides *primary* benefits.

Dual Protection would greatly expand the scope of basic economic loss protection afforded by the present system to cover many accident situations not now compensated by it. In so doing, it preserves and extends the principle of primacy of recovery now embodied in the present liability system. By contrast, S. 945 would abandon that principle and make its coverage benefits excess over most collateral sources of benefits available to the injured party, subject only to the possibility that one of such collateral sources might choose to make itself excess.

We also question how accurately the figures cited from the Department of Transportation's *Economic Consequences of Automobile Accident Injury Study*

represent the actual economic losses of accident victims and the compensation received from various sources including the tort liability system. In our judgment, the aggregate estimated loss figure is grossly overstated and the aggregate recovery amount is understated. These aggregates were stressed in the news release of the study in spite of the fact that the report itself states that the aggregates are not as reliable as averages or ratios. The following statements are taken directly from the study:

On Page 96 (Part II) of the report, it states:

"Due to the speculative nature of the 'future' losses component of the total economic loss, the tabulations have been presented with and without future losses."

On Page 15 (Part I) the following statement is found:

"Consequently this study does not provide reliable estimates of aggregates. Average losses and reparations, or ratios of one variable to another, tend to be less sensitive to the problem of coverage than aggregates and therefore are more reliable as reported in this study."

On Page 17 (Part I) it states:

"The principle focus of this study is on economic losses (*on a per individual or per family basis*) due to serious injury or death from motor vehicle accidents and reparations for such losses from various sources."

On Page 18 (Part I) it states:

"The sample was designed in such a way as to provide more precise estimates of averages and ratios than to aggregates."

One must question a methodology which accepts without question or verification the exact dollar amount of economic loss suffered and the exact dollar amount of compensation received from each source for an accident which occurred some 2½ years previously.

Much of this information could have been verified. We have been told that the pilot study did ask the respondent to identify their own insurance carrier or the insurer of the tortfeasor. This pilot study revealed that in a significant number of cases, the respondent did not remember or know the names of the insurers and consequently this valuable source of information was not checked. It is difficult for us to understand how a respondent can recall detailed dollar amounts of expenses and sources of recovery but not the names of the insurers.

There are many inconsistencies in the area of recovery. The DOT's *Public Attitudes toward Auto Insurance Study* reported that 78% of its respondents were covered by auto medical insurance (NAII's experience shows over 80%) but this Serious Injury Study found only 54% reported having such coverage and only 37.9% recovered from this source. The same disparity exists for collision insurance. The *Public Attitudes Study* found that 77% of car-owning public carried collision insurance but only 29.8% of the seriously injured collected something from this source. We understand that one of the reasons medical payments recoveries may be understated is that the researchers did not understand that funeral expenses were reimbursable under auto medical payments coverage and did not solicit this information in fatality cases.

Furthermore, since 36% of the cases in the study were single-vehicle accidents, which are generally more likely to result in death or severe injury, the economic loss would be much greater and recovery from tort liability would be unavailable.

These are just a few of the reasons we are reluctant to accept the aggregates listed in your question.

As noted above, NAII's Dual Protection Plan does not shift the costs away from those who drive and subsidize it by other sources of recovery. The Dual Protection Plan would provide the injured accident victim swift payment of his basic economic losses (\$2,000 of medical, hospital and funeral expenses and \$6,000 of income loss) regardless of fault. For more serious injuries, the plan requires companies to offer a catastrophe coverage insuring at least the insured and members of his family up to \$100,000 per person for medical, hospital and funeral expenses, up to \$750 per month for net income loss and up to \$750 per month for survivor's benefits to dependents subject to a \$25,000 limit plus a death benefit of \$5,000 payable to a named beneficiary. In addition, in seriously injured cases the person retains the same right of suit he has today for general damages without any statutory limitations.

## Cost-Cutting Provisions . . .

To minimize the costs of the compensation system, Dual Protection provides that damage awards for pain and suffering in the less serious cases (not involving death, permanent disability, disfigurement, loss of limb, etc.) be governed by a formula of between 50% and 100% of the claimant's medical/hospital bills. The Plan also calls for special settlement procedures to more quickly and economically handle small claims against negligent drivers, court supervision of the lawyers' contingent fee system, and stiffer penalties for fraudulent claims.

## Toward a Total Solution . . .

Dual Protection is a sound and well-balanced approach to solving today's automobile insurance problems. Not only will the Plan's coverage features compensate more injured persons faster and more efficiently, but it sets forth actions and proposals aimed at:

- Curbing the accident toll through research, public education, and stronger traffic laws and enforcement.
- Reducing the severity of injuries by fostering improved automobile safety design.
- Developing economic incentives for the production and purchase of more damage-resistant automobiles.
- Cutting the costs of automobile damage repairs through advanced repair technology.

Thus, Dual Protection treats causes rather than symptoms, and in so doing it promises to make a lasting contribution to the personal and financial well-being of the American motoring public.

# DUAL PROTECTION

## What It Is . . .

Dual Protection is a realistic plan to improve the way in which people are compensated for the injuries they suffer in automobile accidents. Its primary aims are to pay more people more medical and disability benefits faster, while stabilizing the overall cost of the system. Developed by the National Association of Independent Insurers, Dual Protection would:

- Automatically begin paying medical expenses and lost income from work — regardless of negligence — to the driver and passengers injured in an insured car, and to pedestrians struck by it.
- Preserve an innocent accident victim's right to recover additional damages from a guilty driver, including damages for pain and suffering.
- Reduce unnecessary litigation over small claims.
- Eliminate fear of catastrophic financial loss.
- Help reduce the costs of automobile accidents.

## Preserves Accountability . . .

In keeping with the fundamental principle of public policy that each member of society bears a responsibility for due care in the operation of his automobile, *Dual Protection preserves personal accountability for highway misconduct*. The negligent motorist would continue to be held financially obligated to the people he injures.

## How the Plan Works . . .

**Basic Coverage:** Under Dual Protection, the driver and passengers injured in the insured car, as well as pedestrians struck by it, would receive up to:

- \$2,000 for medical, hospital and funeral expenses.
- \$6,000 (\$750 a month) for income lost while unable to work.
- \$4,500 (\$12 a day) for other disabled persons, such as a housewife.

These benefits would be automatically included in all private passenger automobile liability insurance policies.\* They would be paid regardless of who caused the accident.

## Catastrophe Protection . . .

To provide protection against the hazard of unusually large losses, Dual Protection would make optional, low-cost catastrophe coverage available to the policyholder and his family. This insurance would supplement the basic coverage and provide the following benefits up to \$100,000 per person:

- All medical, hospital and rehabilitation expenses.
- A maximum of \$750 a month for lost income from work, or \$12 a day for other disabled persons.
- A maximum of \$750 a month or a total of \$25,000 in survivors' benefits.
- A minimum \$5,000 death benefit to the named beneficiary.

\*Some legislatures might desire to make the basic coverage optional.

## DUAL PROTECTION

## A program for improvement of the automobile accident compensation system

## INTRODUCTION

America today is undergoing a process of critical self-evaluation. Lawmakers, regulatory officials, consumer organizations, newsmen and others are re-examining virtually every institution in our society to determine whether it is operating efficiently and in the best interests of the public.

One such institution is our traditional legal system for determining who is entitled to damages for injuries suffered in automobile accidents, and the amount of damages recoverable. Various studies including the recent comprehensive investigation by the U.S. Department of Transportation have been critical of this system, and have urged improvement or reform.

While nearly everyone with an interest or stake in this question agrees that action of some kind is needed, viewpoints differ widely as to what change is indicated.

At one end of the spectrum are those who urge that nothing be done other than minor modifications of court procedures and adoption of measures to permit damage recoveries in certain situations not now recognized. Some of these proposals would, unfortunately, raise costs without bringing any offsetting savings. Thus they would cause additional, unwelcome premium increases.

At the other extreme are those who propose total abolition of the present liability system and elimination of all personal accountability for negligent driving. They would substitute a system compelling everyone to insure himself against all the consequences of injury and damage from another person's negligence. These proposals have usually been accompanied by predictions of substantial insurance rate cuts—predictions which have been challenged by your Association and others as illusory and unrealistic.

Caught in the middle of this controversy—and often bewildered by it all—stands the American public. Beseet by insurance rate increases, they are understandably receptive to proposals which promise premium reductions. Nevertheless, in recent national opinion surveys they have voiced strong support for preservation of the basic concept of personal accountability for highway misconduct, and for the right of an innocent injured party to recover both tangible and intangible damages from a guilty driver.

We do not believe, therefore, that the public wants a compensation system which rewards the wrongdoer every bit as well as his victim. Nor do we believe they would favor a system which in the name of false economy deprives the seriously injured person of his long-standing right to seek damages from a guilty party for pain, suffering and other intangible losses.

Out of the growing controversy comes this question: Is there a viable middle-ground solution to the problem—one which is responsive to major criticisms of the present system, yet does not destroy its many good features?

NAII believes there is such a middle road. In an effort to be of maximum aid to lawmakers, public officials and others considering the problem, we have developed the Dual Protection Plan, a program designed to compensate—

more injured persons' basic medical expenses and income loss;  
more quickly; and  
more efficiently

while preserving their vital rights under the existing liability system.

The overall purpose and effect of the Dual Protection Plan would be to—

Provide injured persons automatic payment of their basic economic losses, regardless of fault, up to minimum limits of \$2000 for medical expenses and \$6000 for income loss.

Assure availability to the motoring public of optional catastrophe coverage at modest cost, to raise those basic limits of medical/disability protection to \$100,000 per person, payable regardless of fault.

Preserve an innocent injured party's right to recover additional damages from a wrongdoer over and above those compensated by the basic automatic-pay coverage.

Adopt guiding standards governing damages for pain and suffering in the less serious liability cases, and defining the measure of damages for wage loss.

Improve and speed up procedures for litigating small claims; retain the contingent fee system, under court supervision.

Stabilize or reduce auto insurance premiums by attacking the causes of inflation in major cost ingredients, including fraudulent claims, the rising accident toll, and soaring auto damage repair costs.

This program is offered as a realistic means of alleviating on a state-by-state basis the major criticisms of the present automobile accident compensation system within the basic structure of that system.

Details of the Plan are discussed in the following pages.

#### I. AUTOMATIC PAYMENT OF BASIC MEDICAL/DISABILITY LOSSES

The traditional American legal liability system applicable to automobile accidents and most other accidents does not compensate all injured persons in all situations, nor was it ever intended to do so. That system undertakes only to give an accident victim a right of action where another person negligently caused his injury; also, in most states the claimant himself must be relatively free of fault. Once a right of action arises, though, the law recognizes all types of damage, including both *tangible* losses (such as medical expenses and lost earnings) and *intangible* losses (such as pain and suffering).

As applied specifically to the automobile accident picture, the existing legal system and the insurance system related to it have been criticized on the following grounds among others:

An accident victim is not assured a source of compensation of any of his losses where he is injured in a one-car accident (driver falls asleep and car strikes a tree), or in a multiple-car accident where fault is totally absent or impossible to determine.

In those instances where legal liability by a negligent third party may exist, although most claims involving insurance are settled rapidly once the facts are known<sup>1</sup>, investigation and negotiation or litigation of claims nevertheless can necessitate a lag between the time medical bills and wage losses arise and a claim is paid.

Too large a portion of the total cost of the system (insurance premium dollars plus the cost of judicial procedures) is expended in attorneys' fees and court costs, in relationship to the aggregate net recoveries by injured parties.

The insurance industry has already gone part way in responding to these problems, through the growing practice of voluntarily advancing money for medical expenses and wage loss to persons with valid third party liability claims prior to final settlement.

#### *Dual protection responds to the need*

In further response to these problems, the Dual Protection Plan will require that all private passenger automobile insurance policies include as a minimum the following automatic-pay benefits:<sup>2</sup>

Medical expense coverage paying all medical, hospital, dental, surgical and similar expenses up to \$2000 limits.

Disability coverage of \$6000 compensating net loss of income up to \$750 per month;

Benefits up to \$12 per day or a maximum of \$4,500 to other disabled persons such as a housewife, to pay for substitute help to perform services the injured person would have performed.

Medical payments will begin immediately, and disability benefits not more than two weeks after the accident. Net income loss is to be computed at 85% of gross income.

These benefits will be payable automatically, without regard to fault,<sup>3</sup> to any or all of the following persons injured in an automobile accident:

<sup>1</sup> Approximately 80% of all automobile bodily injury liability claims are disposed of within 6 months after notice of accident, and about 90% within one year.

<sup>2</sup> Resolution of the question of whether the policyholder should or should not be permitted the option of rejecting such basic coverage involves a number of important social policy considerations, such as the individual's need for protection, which must be ultimately resolved by each legislature on a state-by-state basis. Therefore while on balance preferring that this coverage be included in every policy, we recognize that some legislatures may be concerned about those persons who may have no need for this coverage. Accordingly, we will assist each such state legislature in the development of measures designed to accommodate the interests of such persons.

<sup>3</sup> The proposed statute will permit the basic automatic-pay coverage, as well as the catastrophic coverage later described, to contain exclusions of recovery by (1) a person who intentionally causes the accident, (2) a person driving or riding in a car he knows to be stolen, and (3) a person committing a felony or seeking to elude lawful arrest by a police officer. The legislature may also wish to empower the insurance commissioner to approve exclusions covering other specified types of extreme antisocial conduct.

The policyholder.  
 Members of his family.  
 Permissive users of the insured car.  
 Guest passengers in the car.

Pedestrians struck by the car (in accidents within the state).

The policyholder and his family will be protected not only in accidents involving the insured car, but where injured either while occupying or by being struck by a car that is not covered by similar automatic-pay coverage.

Well over 90% of the persons injured in automobile accidents incur medical and related expenses of less than \$2000 and income loss of less than \$6000. This plan will therefore assure that the vast majority of auto accident victims will receive immediate payment of all their medical bills, regardless of the type or cause of accident, plus income loss payments up to the prescribed minimum limits. Motorists may also elect to purchase the high-limits catastrophe coverage described later.

#### *Dual protection provides primary coverage*

Except as to injuries covered by workmen's compensation systems, payment under the basic automatic-pay coverage will be made irrespective of whether the injured party receives benefits from other sources, such as employer wage continuation payments, unemployment compensation payments or accident and health insurance. To help stabilize costs, however, an offsetting allowance will be made for benefits payable under this coverage in any liability suit the injured party may bring against a third party. Such benefits will also be offset against any claim by the injured party under uninsured motorist coverage applicable to the same accident.

#### *Interim availability of automatic-pay medical/disability coverage*

A number of NAII member companies have already pioneered on a voluntary basis the offering to each of their policyholders of basic medical/disability coverages similar in concept to what is here proposed.

Pending legislative enactment by the various states of such a program in statutory form, and to make this valuable protection more widely available, NAII has formally recommended that all of its companies voluntarily offer the types of coverage here proposed.

## II. MAKE CATASTROPHE LOSS COVERAGE AVAILABLE TO ALL MOTORISTS

One of the problems highlighted by the Department of Transportation study and other recent studies of the existing compensation system governing automobile accidents is the plight of those seriously injured persons who do not have a source of insurance or other funds available to cover all of their out-of-pocket medical bills and wage losses. These would include:

Those who have no legal right of recovery against a third party, such as victims of single car accidents and of multi-car accidents where fault cannot be proven.

Those with a valid right of recovery, but with economic losses so large as to exhaust the liability insurance limits and assets of the party at fault.

The Dual Protection Plan responds to this problem in what we believe to be the simplest and most reasonable method available—a method which does not overturn the present system and deprive the seriously injured of valuable existing rights and remedies.

First, as noted, all private passenger automobile insurance policies will be broadened to contain basic automatic-pay medical/disability coverage affording at least \$2000 medical benefits and \$6000 income loss benefits. Not only will this largely take care of the economic losses of the vast majority of accident victims who suffer only minor injuries, but it will provide a "benefit floor" for those with very serious injuries, and, very importantly, an immediate source of funds to start paying doctor bills and other out-of-pocket expenses.

Secondly, the plan will require that there be offered with every private passenger automobile insurance policy a new form of supplemental "Catastrophe Loss Coverage" applicable at least to the policyholder and his family. Benefits under this coverage will begin when the benefits under the basic coverage have been exhausted, and will compensate all the following types of expenses and losses up to an aggregate \$100,000 limit per person per accident, regardless of the type or cause of the automobile accident:

Medical, hospital, dental, surgical and related expenses.

Net loss of income up to limit of \$750 per month for inability to work, or, in the case of a non-income producer, up to \$12 per day for expenses incurred for services in lieu of those the injured person would have performed.

In death cases, (1) survivorship benefits to dependents of up to \$750 per month subject to a \$25,000 limit, plus (2) a death benefit of \$5,000 payable to a named beneficiary.

While the cost of this new Catastrophe Loss Coverage will vary somewhat between different areas, classifications and companies, it is estimated that the average premium for an entire motoring family will approximate 6¢ per day—the price of a postage stamp. That average premium may be even smaller if the coverage is made excess over other sources of benefits, as is permitted but not required under the plan.<sup>4</sup>

For motoring families which do not have other comprehensive medical/disability insurance programs, this optional coverage will afford massive protection against the motoring hazard at very nominal cost. Even those families which do already have a fairly broad measure of protection from other sources may well wish to supplement that protection with the purchase of this coverage on an excess basis. For people in both categories the coverage will provide a simple, inexpensive way to close any existing protection gap.

### III. PRESERVE PERSONAL ACCOUNTABILITY FOR MISCONDUCT ON THE HIGHWAYS

Some extreme proposals for "reform" of the present system would in fact totally destroy it and substitute a system where the wrongdoer and his victim would be treated exactly alike. Such proposals would abolish the age-old principle of law requiring each citizen to use reasonable care not to injure his fellow citizen, and the counterpart rule holding him personally accountable if he breaches that duty. They would, in other words, completely immunize a wrongdoer from any legal action by his victim for damages—provided the injury is inflicted by automobile.

We see no reason why a person should be immunized from generally prevailing rules of personal accountability the moment he takes his automobile out of the garage. Motoring is one of the prime areas where personal accountability should be retained and enforced. To abolish it would constitute an implied public policy declaration by the legislature that the state no longer really cares how badly one maims his fellow citizen, so long as he does it by car. Such a step would have a seriously damaging impact on driver attitudes and would also tend to destroy motivation for strong traffic law enforcement, with a resultant rise in accidents.

The Dual Protection Plan we propose *preserves the principle of personal accountability*. More than that, our Association is bending every effort to find ways of increasing driver responsibility and strengthening law enforcement, thereby reducing the accident toll.

### IV. KEEP THE PRIMARY LOSS BURDEN ON THE WRONGDOER

A basic concept which has emerged from the public's concern with auto insurance and accident costs is that, to the largest extent possible, "motoring should pay its way". Acceptance of this premise also requires that motorists creating the greatest hazard bear a greater share of the insurance premium burden, as is generally the case under the present system.

This principle would be destroyed by extreme types of "reform" plans which abolish the fault concept and thereby thrust on careful drivers the full burden of insuring themselves against all the losses inflicted by the more hazardous drivers. Dual Protection, however, will preserve this important principle.

Under the Dual Protection Plan, the insurance company issuing the basic automatic-pay coverage immediately pays medical/disability benefits to persons injured while occupying or being struck by that car, whether or not the accident is someone else's fault. The insurer paying those benefits is then entitled to reimbursement from a negligent third party. Reimbursement will occur either by mandatory intercompany arbitration proceedings (if the third party is insured with an insurance company licensed in the same state) or by conventional sub-

<sup>4</sup> As with the basic automatic-pay coverage, the Catastrophe Loss Coverage would be made excess over any applicable workmen's compensation benefits, and sums payable under such coverage would be credited against benefits recoverable under Uninsured Motorist Coverage.

rogation procedures.<sup>5</sup> Thus, those vehicle owners and drivers causing a relatively greater share of the losses will continue to bear a relatively larger share of the total insurance premium burden.

#### V. ESTABLISH GUIDING STANDARDS GOVERNING DAMAGE AWARDS

##### A. Awards for pain, suffering

Among other frequently voiced criticisms of the present system governing compensation of injuries in automobile accidents are these:

Too much of its total pay-out goes for so-called "intangible" damages and not enough for purely economic losses.

Grievously injured persons with valid claims sometimes fail to recover all their economic losses, while settlements and awards to those with minor injuries average several times their economic losses.

Intangible damages are so nebulous as to be difficult or impossible to measure objectively.

Proponents of total "no-fault" programs use these arguments as a springboard for urging total abolition of all right of recovery for pain, suffering and other intangible elements of damages.

While acknowledging that some remedial action is needed in the area of intangible damages, NAII believes that total or substantial elimination of this basic right of recovery would be unwarranted and contrary to the interests and desires of the American public. It would mean that—

A young mother badly crippled for life by a reckless driver would receive nothing for continued pain and anguish and for the severe difficulties encountered in rearing her children;

A child who loses an arm or leg would receive nothing for the resulting disruption of normal occupational, athletic and recreational opportunities and pursuits.

A girl suffering serious disfigurement would receive nothing for a lifetime of humiliation, ridicule, and social handicap.

Nothing would be recoverable, either, for destruction of one's manhood or womanhood, or for the loss of companionship of a loved one, or, except to the exact extent of any provable pecuniary costs, for loss of sight, hearing, or any of the other vital senses.

We do not believe the public will—or should—stand still for any measures that would take away intangible damages in these and similar situations of serious injury. Our conclusions in this regard are supported by the results of several comprehensive public attitude surveys.

Governing standards of some kind for pain and suffering awards in minor injury cases are needed, however, to help stabilize or reduce the cost of the system as well as respond to the other problems just mentioned. The Dual Protection Plan proposes such standards to apply to certain cases where liability claims are lodged or suits filed against motorists who are covered by liability insurance policies containing basic automatic-pay coverage.<sup>6</sup>

Under those standards, awards for pain, suffering, mental anguish and inconvenience would be limited to an amount equal to 50% of the first \$500 of reasonable medical and hospital treatment expenses and 100% of such expenses over \$500.

No limitations would apply, however, to cases of death, permanent total or partial disability, disfigurement or loss of limb, or other special circumstances shown to involve actual, substantial pain and suffering.

Under this proposal, damage awards for pain and suffering in the case of seriously injured persons such as those in the foregoing examples will continue to be determined exactly as they are at present, without any statutory yardsticks. Awards to persons with less serious injuries involving no permanent

<sup>5</sup> The Plan does not make any specific provision either requiring or preventing subrogation under the optional Catastrophe Loss Coverage; it is left to the individual insurance company to decide whether to provide for a right of subrogation, subject to the laws of the particular state.

<sup>6</sup> It is proposed that the cost-saving benefits of these standards governing awards for intangible damages shall not be extended to those categories of defendants who have not purchased or otherwise been covered by a liability policy containing the prescribed automatic-pay coverage. Thus, the existing legal rules and procedures for determining damages for pain and suffering would continue unchanged for any liability claim or lawsuit against (1) an uninsured motorist, (2) a commercial vehicle (unless basic automatic-pay coverage was voluntarily purchased), or (3) an out-of-state vehicle not carrying a liability policy containing basic automatic-pay coverage.

complications or other special circumstances, though, will be subject to the formula.

#### *B. Income tax factor in liability awards for loss of earnings*

At the present time, damage awards for loss of earnings in liability actions are not subject to income taxes. A person who has been awarded such damages actually receives a windfall, because his award is computed on the basis of gross earnings rather than the "take home pay" he would have received had he not been injured. This overpayment can be sizeable where loss of earnings represents a substantial part of the claimant's damages.

To rectify this discrepancy, and again because of the need to achieve every economy reasonably possible in the automobile injury reparations system, we propose that damage awards for loss of earnings in liability cases be subject to an offset of 15% for the income tax that presumably would have been payable if the earnings had actually been realized. The statute would clearly provide, however, that if the claimant can establish that his earnings would actually have been subject to a smaller income tax rate, or to no tax at all, the tax offset would be reduced accordingly or completely eliminated.

#### VI. IMPROVE PROCEDURES FOR DISPOSING OF CLAIMS AND LAWSUITS

While most claims arising out of automobile accidents are settled within a relatively short period and without necessity of litigation, delay does remain a problem in some instances and areas. It should be noted that delay in many cases is not the fault of the defendant or his insurer. It may, for example, result from lack for adequate or timely information from the claimant as to the nature of his injuries and medical treatment. Or, where a lawsuit is filed, it may be delayed by the backlog of cases that have glutted the court docket or the lawyers' dockets.

For a number of years, NAII and its member companies have been directing their efforts to finding means of streamlining and otherwise improving both the claim settlement process and the judicial process, so as to eliminate or minimize unnecessary delays and other sources of friction occurring at any points in the system, for any cause.

##### *Advance payment procedure*

Thus, NAII members have been in the forefront of those companies employing the advance payment procedure in cases of probable liability on the part of their policyholders. Money is immediately and voluntarily advanced to the injured third party to cover medical bills, wage loss and other expenses; no release is required—only a gentlemen's understanding that if suit is ultimately brought the sums advanced will be credited against the amount demanded.

Through the increasing use of this technique in recent years hundreds of millions of dollars have been put into the hands of accident victims *at the time needed*. Just a few of the many examples of its use are listed in the attached excerpt from the 1968 treatise "Advance Payments in Liability Claims" by Buchheit, Young and Kurtoch.

The legal implications of advancing monies voluntarily without taking a release may constitute some deterrent to even fuller use of the advance payment process in some areas and situations. Therefore, the Dual Protection Plan includes a proposed statutory provision for those states which do not already have one, to make it clear, among other things, that voluntary advance payments shall not be construed as an admission of liability by the insurer or its policyholder, and to assure that sums so advanced will be credited against any recovery in a lawsuit.

##### *Voluntary claim guiding principles*

Several years ago, in furtherance of its member companies' policy of providing the best possible service to the insuring public and to automobile accident victims, the NAII adopted and implemented the attached Guiding Principles Relating to Automobile Insurance Claims. These Principles, which constitute a summary and restatement of long-standing good practices by claimsmen, were developed and approved by this Association's Claims Committee and Board of Governors and distributed to our entire membership in January 1969. They now constitute an important part of the basic policy of this Association and its membership.

### *Expedite small claims*

NAII recognizes that notwithstanding voluntary efforts such as these by insurers to improve and expedite the claim settlement process, problems remain which call for further steps. The sheer number of auto accidents and the necessity for determining their cause and evaluating the resulting injuries and damage occasions some delays, especially where disagreement arises as to either of those issues.

Critics of the present system have emphasized the fact that viewed both from the *time* standpoint and the *cost* standpoint, the system is least efficient where it involves litigation of the *smaller* cases—those entailing minor injuries, or no injuries but just property damage. We believe that the time and expense expended in the trial of a lawsuit under our traditional judicial process can, for example, be justified in a controverted case involving a claim of tens or hundreds of thousands of dollars for alleged permanent disability. But it is wasteful to have to invoke the same costly and time-consuming procedures for the resolution of every disputed claim for a few hundred or thousand dollars.

Again, the solution does not necessitate scrapping the whole system as some would advocate. It can be achieved by remedial steps within the basic structure of the system.

As noted earlier, for the vast majority of automobile accident victims (including many now barred from recovery) the Dual Protection Plan by providing automatic payment of basic medical/disability benefits will eliminate any problem of delay in obtaining funds for payment or reimbursement of economic losses for injuries. Such benefit payments will be made promptly upon receipt of medical bills and wage loss information, without awaiting any determination as to fault or cause of accident.

Property damage to vehicles will continue as at present to be compensated from two sources; (1) by claim against the vehicle owner's own collision coverage; or (2) by claim against the party at fault, if any, and in turn the latter's property damage liability insurance coverage. Like the proposed automatic-pay medical/disability coverage, collision coverage pays off immediately, regardless of fault. The insurer then has a right of reimbursement from an at-fault third party, if any, and his liability insurer.

Thus, both as to vehicle damage losses and basic medical/disability losses, the great majority of automobile accident victims will be compensated promptly and without regard to cause of accident. The issue of which insurance company should ultimately bear those losses in multiple-car accidents will subsequently be resolved either by intercompany arbitration (a very economical process already widely used by the insurance industry) or where necessary by subrogation action. Most important, the basic benefits are paid to the claimant first and then the companies decide between themselves which one should bear the loss.

There will of course remain to be disposed of through the customary settlement procedures, or through litigation where necessary, (1) claims for intangible losses and for economic losses in excess of the basic automatic-pay benefits, (2) claims for property damage not compensated by collision coverage, and (3) injury and death claims arising in motor vehicle accidents not covered by private passenger automobile liability policies issued in the enacting state.

### *Small claims arbitration*

To aid in the prompt, economical disposition of the smaller claims in these residual categories which cannot be resolved by the settlement process, and especially for use in states with a court congestion problem, the Dual Protection Plan includes a proposed statutory provision authorizing creation of a small claims arbitration system to handle all cases up to \$3,000 in amount.<sup>7</sup> This measure is patterned after the highly successful Pennsylvania law under which many thousands of small claims (both third party liability cases and other types of civil cases) have been removed from overburdened court dockets and processed quickly and reasonably.

As an alternative to this approach, our Association would give support to the creation of special small claims courts designed to accomplish the same general objective as the Pennsylvania arbitration plan.

### *Disclosure of medical evidence*

Prompt settlement of claims is sometimes delayed because the defendant and his insurer are denied access to all the information they reasonably need to evaluate the claimant's injuries and validate medical treatment expenses. In

<sup>7</sup> Or such other "threshold" level a state legislature may see fit to establish.

some instances such information is withheld until a lawsuit has been filed and trial commenced.

To alleviate this problem, the Dual Protection Plan provides that persons claiming damages or policy benefits for injuries sustained in an automobile accident shall if requested consent to physical examination by a doctor supplied by the defendant or the insurer. It also requires such claimants if requested to provide any information reasonably needed concerning the injuries claimed and the treatment undergone.

#### *Other remedial steps*

In addition to the steps just described, NAII and its members are prepared to support any specific action or measures needed locally to eliminate special problems that may cause or contribute to unreasonable court delay. Our staff, committees, and company officials have given a great deal of study to the court congestion problem and have initiated or participated in projects in various areas designed to alleviate it. We will continue to work in every way to help make the judicial system operate fairly and efficiently.

### VII. COURT SUPERVISION OF CONTINGENT FEES

One of the most controversial features of this country's existing legal system is the long established practice by plaintiff lawyers of handling most personal injury cases on a contingent fee basis. Under this arrangement no fee is paid or payable unless a settlement or judgment is obtained. In the event of recovery the lawyer receives a percentage of the total award recovered; that percentage often amounts to 33⅓% and sometimes more.

Proposals have from time to time been advanced either to prohibit contingent fee arrangements completely, or to restrict their use to cases involving indigent claimants.

There have unquestionably been some abuses within the contingency fee system. However, contingency fee arrangements do serve the worthwhile purpose of assuring an injured person the availability of legal counsel without the necessity of advancing or committing himself to a substantial fixed fee or retainer.

The Dual Protection Plan calls for retention of the contingent fee system, but with somewhat closer court supervision: It provides for adoption by the courts of rules prescribing maximum contingent fee schedules applicable to all motor vehicle accident cases under their jurisdiction. A lawyer could file for a higher fee allowance from the court in any case where he believes those prescribed are not adequate. Unlike some other programs, our plan does not itself specify any maximum percentage figure; that is left to the courts to prescribe.

Precedent for such regulation of fees can be found in the court rules in several states, as well as in the Federal Tort Claims Act. The probate courts in many states also regulate and require disclosure of fees in probate cases.

We believe that reasonable regulation of contingent fees as here proposed in states lacking such specific procedures will prove beneficial both to the public and to the legal profession. It is our further belief that this type of regulation will elicit support from within the bar itself.

### VIII. CURB INFLATION IN MAJOR PREMIUM COST INGREDIENTS

While Dual Protection is intended, among other things, to stabilize or reduce the cost of automobile insurance, the NAII is aware that truly dramatic premium savings can only come as and when progress is made in curbing the major underlying cost ingredients of the insurance premium dollar. Chief among these ingredients are the highway accident spiral and the upsurge in costs of treating human injury and repairing damaged automobiles.

With this in mind, the NAII and the safety organizations it supports have been engaged for many years in intensive effort to reduce accidents and decrease injury severity through research, public education and the fostering of strong traffic laws and enforcement. In addition to individual company efforts in the traffic safety area, NAII companies collectively have provided the major share of the operational budget of the Insurance Institute for Highway Safety, an independent, non-profit organization dedicated to the reduction of highway accident loss.

### *Attack the larger half of the loss picture*

Though the primary emphasis of our efforts must continue to be focused on curbing deaths and injuries, the greatest opportunity for effecting significant premium savings lies on the material damage side of the loss dollar. Today, almost two-thirds of the auto insurance premium dollar for a typical package of insurance including a late model vehicle is spent for car damage coverages. More than 10 times as many people incur damage to their cars as incur personal injuries!

For these reasons, the NAII has been in the forefront of efforts to stabilize the cost of vehicle damage insurance through programs directed at the improvement of automobile design and the reduction of auto damage repair costs.

Our Association in recent years has been continually spotlighting—in Congressional hearings and elsewhere—the four basic causes behind the upsurge in material damage losses: speed, horsepower and high-performance cars; the spiral in automobile prices and the prices of crash repair parts; the increases in repair garage charges, and the extreme vulnerability of today's automobiles to costly damage even in low-speed crashes.

This constant public airing of a critical problem has helped to touch off an encouraging chain of events. Auto dealers have reported a decline in the sale of "hot" cars; auto manufacturers announced they were shelving certain plans they had for further souping up the horsepower of some of their new models, and several of the major car-makers have said they will install functional bumpers on their cars for 1973 and beyond.

NAII has also been engaged in pioneering research programs designed ultimately to cut the costs of repairing damaged automobiles. One of these projects is being conducted under NAII sponsorship by the Cornell Aeronautical Laboratory. Its purpose is to determine if the damage to a car in a given crash situation can be analytically projected before the crash takes place, and even before the car is put on the market. If this concept proves feasible, as preliminary indications suggest, then cars can be indexed according to their relative vulnerability to damage and their cost to repair. Premium rates, in turn, could be based upon such an index.

In addition, the NAII has been devoting intense study to the need for establishing an industry-sponsored research center whose purpose would be to pioneer new cost-saving techniques in the field of automobile crash repair. A team of NAII staff and member company representatives recently traveled abroad on two occasions to study the operations of the Motor Vehicle Crash Research Centre in Britain, and a similar facility in Sweden. Though they have been in existence for only a short time, these unique facilities have already produced a number of advances in repair technology. The NAII is continuing to explore this concept to evaluate its feasibility and practicability in the United States.

Our Association is optimistic that through projects and studies of the kind just described, we will be able to make a substantial contribution to the goal of reversing the rising trend of automobile insurance costs.

### *Crack-down on claim fraud*

As mounting loss payments exert increasing upward pressure on automobile insurance rates, the insurance business must devote extraordinary efforts to eliminate every element of unnecessary cost. One serious and regrettable continuing source of waste is claim fraud, a scourge which adds tremendously to the insurance cost burden borne by the American public.

Programs to expose and combat claim fraud have long been carried on by individual insurance companies and organizations. In order to increase the effectiveness of such actions NAII and the other leading casualty insurance trade associations have recently participated in the creation and staffing of a separate new instrumentality, the Casualty Insurance Fraud Association (CIFA), to deal solely and specifically with the problem. CIFA will aid and complement the work of overburdened law enforcement agencies nationally by investigating suspected fraudulent activity in automobile and general liability insurance situations. It will give priority to exposing and bringing about the prosecution of organized auto accident fraud rings, which ruthlessly pick the pockets of the insurance-buying public by countless millions of dollars annually.

To provide a more adequate statutory framework for prosecution in states now lacking strong and explicit laws on the subject, the Dual Protection Plan proposes legislation imposing stringent penalties for conviction of any type of claim fraud arising out of automobile accidents. It calls for a fine of up to \$500

or imprisonment up to one year, or both, upon conviction of a first offense involving a claim up to \$100 in amount, and a fine of at least \$500 or imprisonment up to 10 years, or both, for convictions of a fraudulent claim of over \$100 or for a second or successive conviction regardless of amount of claim.

#### CONCLUSION

By way of summary, the Dual Protection Plan will :

Compensate the basic economic losses of the vast majority of automobile accident victims, including many now receiving nothing from the accident reparations system.

Afford optional protection against the hazard of catastrophic economic loss, at nominal cost.

Pay such benefits immediately when needed, without regard to questions of fault.

Preserve the innocent injured party's right to recover additional damages against a wrongdoer.

Adopt reasonable standards for ascertaining damages for pain and suffering in the less serious cases.

Retain personal accountability for negligent driving, and keeping the major share of the premium cost burden on those who present the greatest hazard on the highways.

Increase the speed and efficiency of the present system, particularly as to smaller claims and losses.

Help relieve court congestion.

Stabilize or reduce automobile insurance premiums and cut the overall cost of the accident reparations system.

#### *State-by-State implementation*

NAII believes that determination of the rights, responsibilities and compensation of individuals involved in automobile accidents should remain a matter of state law, as at present. The Dual Protection Plan is designed for that purpose, and is readily adaptable to the specific problems and statutory settings of different states. It is submitted as a program of evolutionary reform which will bring the public an increased measure of protection against economic loss without sacrificing their vital rights and valuable benefits under the present system.

Additional information about the Plan is available upon request.

---

#### EXCERPT FROM "ADVANCE PAYMENTS IN LIABILITY CLAIMS"

(By Buchheit, Young, and Kurtock—October 9, 1968)

The following examples submitted by contributing companies will assist the reader in understanding the scope of advance payments in present practice.

1. A Canadian insured, operating his vehicle on a gravel, wet road, failed to negotiate a curve and struck a tree stump. His passenger, a 33 year old waitress, sustained a fractured femur, with open reduction and subsequent infection. Her total period of hospitalization was 153 days. Her husband had been unemployed, and the bank was threatening foreclosure proceedings on their home mortgage. The adjuster paid off the mortgage as well as the hospital and medical bills, in an advance payment of \$5,800. The mortgage officer of the bank was an enthusiastic promoter of the company and its advance payments program, and the action taken was a topic of discussion in the community for many weeks thereafter.

2. Claimant, a minister, sustained an injury to his larynx, and while recuperating, was unable to talk above a whisper. A replacement minister was unavailable. The adjuster purchased an amplifier system for the church which was received by the minister and congregation with gratitude. The claim was concluded for actual expenses incurred, and the amplifier system was donated to the church.

3. One claim involved a serious chartered bus accident on a snow drifted mountain road, resulting in three deaths, three serious injuries, and thirty-five minor personal injury claims. All of the claimants were soldiers on their way home for Christmas. The company claims representative met with the commanding officer of the army base and arranged for a charter flight, with advance payments to each soldier to cover his personal expenses, plus air line tickets for his

return home, and return to base. The General Staff of the army at the Pentagon in Washington, D.C. were most complimentary of the manner in which this case was handled.

4. In a remote section of the Northwest, a young man sustained severe and disfiguring facial injuries as a result of an accident arising out of the insured operator's gross negligence. His parents were of modest financial means and the carrier arranged to transport him periodically to a large city where he was attended by one of the city's top plastic surgeons. Total funds advanced exceeded \$10,000. The ultimate results were excellent, and the young man subsequently invited the adjuster to his wedding.

5. A college senior was killed. In attempting to effect an adjustment with the parents of this boy, the adjuster realized that the parents were not interested in financial compensation as such. After some consideration, the adjuster proposed establishing in perpetuity a scholarship at the university in the name of the deceased. He also purchased a permanent trophy to be maintained at the deceased's high school from which he graduated as valedictorian of his class. The names of scholarship awardees will be inscribed on the trophy.

6. A sixteen year old boy was seriously injured by an automobile while riding a motorcycle. He sustained comminuted fractures of the right femur and of both bones of his left forearm. Faulty healing required a long period of disability and it was feared that the boy might never return to high school. In addition to advancing the money to pay the medical and hospital bills, the company arranged to have a two-way speaker system installed between the hospital room and the classroom. The boy not only hears what goes on in the classroom but he recites and takes part in classroom discussion.

7. Over \$72,000 was advanced by one company to a quadriplegic. A rehabilitation program caused restoration of some function and the injured party is now able to take care of herself without round-the-clock nursing service. The case was finally settled by the purchase of an annuity.

8. A fifty-two year old man sustained serious back injuries. After advance payments had begun, the claimant retained an attorney through whom payments were continued. The attorney and the adjuster worked with the State Rehabilitation Board and succeeded in putting the injured party through an educational program which resulted in full rehabilitation.

9. A twenty year old girl sustained serious fractures of both femurs. Repeated surgical procedures were required. Payments were advanced in excess of \$7700, including over \$1,000 for the services of a Christian Science practitioner and over \$800 for telephone communication with this practitioner who was located in another state. Included in the total advanced was a special tuition allowance to permit the claimant to keep up with her education while disabled. In this particular case, a final settlement offer was made at which time the claimant consulted a prominent attorney. His recommendation was that the settlement offer be accepted.

10. A fifty-seven year old executive sustained an extremely severe injury to the knee in 1966, and has been unable to work since. A total of \$17,736 has been advanced to date, and the company is now considering a choice of annuity arrangements together with a policy which will take care of further medical or surgical expenses resulting from the injury.

11. A fifteen year old girl sustained a skull fracture, comminuted fracture of the left femur and other injuries. She was in a coma for three days and her life was in danger. The company, notwithstanding a low policy limit, began paying medical bills, paid the private duty nurses weekly, and paid the mother \$100 a week so that she could quit her job—relocate near the hospital and help her daughter recover.

12. A twenty year old married truck driver sustained an injury which required the amputation of a leg. The company advanced hospital and doctor bills and net take home wages. A lawyer was engaged by the family shortly thereafter and the advance program was continued through him. The case was ultimately settled in what the company believes was a very favorable climate produced by their willingness to give immediate assistance.

13. A fifteen year old girl sustained severed ligaments to her hand and nerve damage. Hysteria was tightening the hand into a mere claw. The local physician recommended the attention of specialists. The girl was immediately sent to a Hand Rehabilitation Clinic at a nearby university, undergoing surgery twice, and emerging with only a 15% residual disability. The family was one of moderate means and could not have afforded this care without the assistance of the insurance company.

14. An automobile occupied by two young people was hit head-on by the insured. Both claimants were hospitalized. The parents arrived from out of town and the adjuster assisted them in registering at a motel, arranged airplane tickets, purchased new clothing for the injured claimants, took care of the hospital bill, had the automobile repaired and paid for it, and finally took the family to the airport for their return home.

15. The claimant, a laboring man traveling on motorcycle, sustained a badly crushed leg which the local physician felt would necessitate amputation. An offer by the adjuster to move the claimant to a large medical center some distance away was gratefully accepted. The best orthopedic talent was put on the case and the leg was saved. During the period of convalescence, the adjuster made arrangements to have the wife near the center and took care of her transportation and room and board. A total of \$17,000 was advanced and final settlement was made directly with the family for a substantial additional sum of money. Total treatment, including extensive therapy and rehabilitation, took approximately two years.

16. A twenty year old married claimant was struck head-on by the insured's tractor-trailer. He sustained numerous serious and disabling injuries. Advance payments were begun, and continued after claimant obtained legal representation. In less than eight months, a total of almost \$11,000 was advanced for medical, wages, and incidental expenses, plus \$1200 for damage to the automobile. The case was settled without litigation.

17. A fifty-seven year old married female suffered fractured legs, fractured arms, and a fractured nose, jaw and ribs. Before the accident she operated a gift shop. The husband had to leave his job and run the shop during her convalescence. Advances of approximately \$5,000 were made for hospital expenses not otherwise covered, lost wages and incidental expenses. The case was settled directly with the claimant for a sum very close to the substantial policy limit.

18. An elderly woman sustained a fractured hip in a fall and was hospitalized and later placed in a rest home for convalescence. Her principal concern was the possible loss of her small apartment because of her inability to pay for rent and utility. The adjuster saw that these expenses were taken care of monthly, and presumably at this date the claim has been disposed of amicably.

19. A college football player, seriously injured in a crosswalk, lost his football scholarship. The company advanced his tuition and other expenses to permit him to continue college, prior to settlement. The young man has now graduated from college and the case brought to a satisfactory conclusion.

20. A claimant, injured in a fall, required physiotherapy and was reluctant to make continued visits to a doctor's office. The claim representative advanced him \$100 to take out a membership in a local health club which provided the needed facility. The claimant later returned \$30 of the advance to the claim representative, advising that the membership was only \$70.

## GUIDING PRINCIPLES RELATING TO AUTOMOBILE INSURANCE CLAIMS

### INTRODUCTION

The National Association of Independent Insurers and its member companies believe that the administration of automobile insurance claims is the ultimate service and product of automobile insurance. The claims function must be performed with integrity within the framework of the American legal and judicial system, governmental regulation, and the contractual provisions of automobile insurance policies. We continue to conceive our objective in the disposition of automobile claims to be the administration of justice in the day-to-day affairs of men by the application of these factors to each individual occurrence.

Because of our contractual relationship, we owe a loyalty and duty to those whom we insure. We represent them, and we act in their interests. It is our duty to act efficiently and economically. In addition to our contractual duty to our insureds, we recognize our obligation to process claims in such manner as to serve the social and economic welfare of the American public. In keeping with this obligation, many of our companies are employing various new techniques in payment and settlement such as payments in advance of final settlement, rehabilitation and open-end releases.

Now, therefore, we reaffirm and publish these Guiding Principles relating to Automobile Insurance Claims. They are of necessity general in scope and as in

the case of any other general principles must be read in the context of the law and practice in the state or area in which business is conducted. We declare it to be our earnest intent and purpose to:

1. Conduct claim investigations in a diligent search for the facts as promptly as possible.
2. Contact claimants promptly as to an accident initially reported by an insured in which there is reason to believe the insured may be legally liable.
3. Contact the insured promptly as to an accident initially reported by a claimant, and continue processing the claim.
4. Determine the amount of automobile and other property losses promptly and fairly.
5. Respond promptly, when a response is indicated, to all communications from insureds, claimants, attorneys and other interested persons.
6. Give a prompt, courteous and forthright explanation to each claimant as to the company's position with respect to his claim.
7. Conclude each claim, large or small, on the basis of its own merits, in the light of the facts, the law, and the coverage afforded.
8. Pay meritorious property damage claims promptly without requiring simultaneous settlement of bodily injury liability claims.
9. Investigate coverage questions expeditiously; inform the insured and claimant of the companies' position as promptly as possible; litigate only meritorious policy defenses.
10. Assist in the physical rehabilitation of injured persons where such procedure is indicated by the injury, the liability and the policy provisions.
11. Facilitate, in the case of claims involving more than one company, the prompt and fair disposition of the claim, later seeking to resolve any controversy between insurance companies without recourse to the courts.
12. Co-operate in every proper way, when a claimant files suit, to secure prompt disposition of the litigation.
13. Review at the management level all complaints received concerning claim handling.
14. Adhere to the ethical standards set forth in the Statement of Principles adopted by the National Conference of Lawyers, Insurance Companies and Adjusters.
15. Seek and support new methods designed to provide improved claim services for the public.

(Whereupon, at 5:45 p.m., the hearing was adjourned to reconvene at 10:00 a.m., May 10, 1971.

# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

MONDAY, MAY 10, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met, pursuant to recess, at 10 a.m. in room 5110, New Senate Office Building, Hon. Philip A. Hart presiding.

Present: Senators Pastore, Hart, Moss, Cotton, Pearson, Griffin, Baker, and Stevens.

Senator HART. The committee will be in order.

Our first witness this morning, and I welcome him, is a distinguished citizen of Michigan, the vice president of Ford Motor Co., Mr. John J. Nevin.

Mr. Nevin, you were good enough to furnish us in advance with your statement. I apologize, but over the weekend I have not had a chance to read it. We will order it printed in full in the record, and if there is any extension you care to make—footnoting or summation—feel free to do it.

## STATEMENT OF JOHN J. NEVIN, FORD MOTOR CO. VICE PRESIDENT, CONSUMER SERVICE DIVISION, THE AMERICAN ROAD, DEARBORN, MICH.

Mr. NEVIN. Mr. Chairman, my name is John J. Nevin; I am a vice president of Ford Motor Co. Ford welcomes this opportunity to express its views on S. 976.

The Senate Commerce Committee has sought, on several occasions in recent years, to enhance the knowledge and the freedom of choice of the consuming public through legislation. The sponsors of S. 976, without doubt, have a similar purpose.

Ford is unable, however, to support many of the provisions of S. 976. S. 976 is concerned largely with the repairability and damageability characteristics of automobiles. It is similar to safety and air pollution control legislation in that it would permit or require administrative actions that might add significantly to the selling prices of automobiles. It differs, in our opinion, from safety and air pollution control legislation in that it deals with vehicle characteristics that are more the concern of the individual buyer than the concern of the public in general.

S. 976 goes far beyond the goal of enhancing the knowledge and the freedom of choice of the consumer and proposes a vast new system of regulation for an industry already thoroughly subjected to regulation. Standards promulgated under the authority of the Safety Act of 1966 and the Clean Air Amendments of 1970 will require a virtually

(1211)

complete reengineering of motor vehicles during the next few years. Our engineering resources are even today overtaxed by effort to comply with air pollution and safety standards that have been assigned the highest level of priority. To conserve these resources we have taken action to severely limit our efforts on other engineering and design programs.

Ford accepts the desirability and, in fact, the necessity of adding costs to automobiles in order to accomplish public air pollution and safety objectives. We believe, however, that new legislation requiring or authorizing actions that might affect the prices of new cars should be adopted only after giving full consideration to the possible cumulative impact on car prices of the proposed legislation and of legislation that has been previously enacted.

Ford also accepts the desirability and necessity of limiting the consumer's choice by establishing compulsory vehicle standards that affect the safety or pollution characteristics of a vehicle. We believe, however, that compulsory standards may not be desirable when those standards affect only the repairability or damageability characteristics of a car. The establishment of such standards could, in our view, unduly restrict the choices available to the consumer.

In summary, Ford believes that S. 976 would require that engineering and research resources in the automobile industry be directed from high priority air pollution and safety programs, would permit the promulgation of regulations that might add significantly to new vehicle prices, and would unnecessarily restrict customer choice in the automobile market. For reasons that will be reviewed in the material to follow, Ford concludes that S. 976 offers no substantial promise of offsetting reductions in insurance and repair costs for the American consumer.

If I may move to the discussion of the individual sections of the bill and deal first with compilation and distribution of data on comparative damage susceptibility.

Proposed section 125 (a) directs the Secretary of Transportation to:

\*\*\* develop and prescribe by regulations issued not later than July 1, 1972, a system of tests and testing procedures designed to allow a determination and comparison of the susceptibility to damage of passenger motor vehicles involved in traffic accidents which reasonably may be anticipated to occur at normal speeds and under normal operating conditions, including, but not limited to, collisions at speeds of 5, 10, and 15 miles per hour.

Proposed section 126 provides that:

\*\*\* no manufacturer shall sell, offer for sale, introduce or deliver for introduction in interstate commerce, or import into the United States—any passenger motor vehicle manufactured on or after January 1, 1973, unless production models of the make and model of such motor vehicle have been tested in accordance with the regulations promulgated by the Secretary under section 125 (a) of this Act.

The bill would require the testing of production models rather than preproduction prototypes. Normally, we may have as few as 45 days between the start of production and the public introduction of the new model. The Secretary would probably want, and in regulations issued under the provisions of the 1966 act he has required, submission of performance data at least 30 days prior to introduction day so that he would have time to review the data before it is provided to customers at the time the new models go on sale. We would, therefore, have as little as 15 days from the start of production to the time at which

we would be required to complete testing and report results. The alternative would be to stockpile large quantities of new models for some indefinite period of time.

The major consumer interest in the damageability characteristics of an automobile is associated with the probable cost of vehicle ownership. For the majority of consumers contemplating the purchase of a new car, the most meaningful index of damageability is one that advises him that a specified reduction in insurance premiums can or cannot be obtained by choosing a particular model. From this information he can infer parallel savings on repairs he may have to pay for himself.

In dealing with insurance premiums, however, the bill requires only that:

The Secretary shall—make such information available to insurance companies and business organizations engaged in the business of selling or underwriting vehicle insurance in interstate commerce \* \* \*

and

\* \* \* report to the President and the Congress on February 1, 1973, on the extent to which the motor vehicle insurance industry is utilizing such information in the determination of insurance rates.

No further action is required of the Secretary or the insurance industry. In fact, the Secretary is not even required, in establishing tests, to determine that insurance premiums will be adjusted to reflect differences in damageability.

The insurance industry uses a variety of rating criteria in establishing premiums for an individual policyholder. The great majority are related to the age, sex, traffic record, and driving characteristics of the person to be insured. While the rating of the policyholder has reached a high level of refinement, little effort has been made to rate the safety or damageability characteristics of the vehicle.

It is to be noted that in the 5 years since the passage of the National Traffic and Motor Vehicle Safety Act of 1966, no adjustments in insurance rates have been made to recognize the effect of the many compulsory standards that have been promulgated to improve the safety characteristics of recent model American cars. Ford believes that the absence of such ratings results from the fact that any premium reductions justified by differences in the car to be insured would be dwarfed in their impact on the policyholder by ratings related to the characteristics of the person to be insured.

Only one major automobile insurance company in the United States has stated that it would reduce premiums on cars equipped with a design feature as substantial as 5-mile-per-hour bumpers front and rear. The reduction that has been offered would be limited to collision coverage. It would produce savings of less than \$15 per year for the average American policyholder and less than \$25 per year in a high insurance cost area like Washington, D.C. It should be noted that the effect of rating characteristics as subtle as whether or not an 18-year-old male driver in the family was a good student, or whether or not the insured drives more than 19 miles to work, would have an impact on premiums five to six times the size of the reduction offered for 5-mile-per-hour bumpers.

If I may interrupt for just a moment and explain the table in my testimony: In Washington, D.C., (the basic insurance premium

for \$100 deductible is \$122 for a 1971 Ford Galaxie. The premium would drop to \$92 in the second and third years and \$79 in the fourth and fifth years. Assuming a 20-percent reduction in collision premiums only, the policyholder would save \$24 in the first year in a high-cost area like Washington, D.C., something like \$18 in the second or third year, and something closer to \$16 in the fourth and fifth years.

You will note from the table that the reduction offered if an 18-year-old qualifies for a good student rating or if the driver drives more than 10 miles to work, the reduction and the increases are in excess of \$100.

Returning to my testimony, Ford believes that the imposition of vast new testing requirements on the automobile industry, at a time when the industry is faced with the extraordinary testing demands of higher priority air pollution and safety standards, is unnecessary. Ford recommends that no new testing requirements be imposed on the automobile industry until the Secretary of Transportation has developed a method of comparison that the insurance industry is prepared to accept and until the legislation provides assurance that meaningful reductions in insurance premiums will result from the data gathered in these comparisons.

At the point in time at which these criteria are met, Ford would have no objection to the publication of data advising the consumer that he could obtain specific reductions in his insurance cost by purchasing a specified make or model.

We believe, however, that the requirement that production versions of each make and model be tested at various different speeds is unnecessary. We suggest that the industry be permitted to use the same reporting procedures, with respect to damageability, that it is now permitted to use in reporting the safety characteristics of the car.

Personal injury risk comparisons: Proposed section 125(d) would require the Secretary to—

Undertake a study of the feasibility of developing tests and testing procedures designed to allow a determination and comparison of the risk of personal injury or death to occupants of passenger motor vehicles from traffic accidents which reasonably may be anticipated to occur at normal speeds and under normal operating conditions.

The proposal requires the Secretary to report his findings and recommendations to the President and the Congress by July 1, 1972, but if he finds such tests are feasible, he is required to prescribe a system of tests and test procedures without further scrutiny by the President or the Congress.

Ford would fully support a study designed to improve the information available to consumers. We believe also that information gained from such a study might assist the Department of Transportation in establishing needed priorities to guide the Department in promulgating future standards affecting the safety characteristics of automobiles.

We think it is important to note that in the 5 years since passage of the 1966 act, it has not been possible to develop tests that would permit comparisons of the relative risk to occupants of cars built before and after the effective dates of many of the compulsory safety standards that have been promulgated. We doubt, therefore, that the re-

quirement that the proposed new study be completed by July 1, 1972, is reasonable. Ford suggests that the reporting date be extended.

We believe, however, that the Secretary should not be authorized to take further action on the basis of this study alone. Because inaccurate comparisons could mislead consumers and do serious harm to manufacturers, we think the President and the Congress should be provided the opportunity to review and act on the results of the study before the Secretary is authorized to proceed further.

**Property loss reduction standards:** Proposed section 125(b) requires the Secretary to—

As soon as possible, after July 1, 1972, promulgate property loss reduction standards which will minimize the economic losses associated with motor vehicle accidents.

Proposed section 125(c) requires the Secretary to—

Promulgate a property loss reduction standard which requires that all motor vehicles manufactured after January 1, 1975, and offered for sale in the United States, are so designed and constructed with energy-absorbing bumpers capable of withstanding impacts, front and rear, of 5 miles per hour into a solid fixed barrier.

Ford does not believe that the establishment of compulsory standards governing the damageability of automobiles is desirable. If the issue is solely damageability, we believe that Government efforts should be directed at providing the consumer with the information on comparative insurance costs that could be made available if the damage susceptibility testing provisions of S. 976 were modified as previously suggested.

The establishment of compulsory standards would restrict the consumer's choice by requiring him to accept an advantage in damageability at the price of compromises in other elements of the purchase that may be of greater importance to him.

If an automobile buyer elects to accept a damageability risk in exchange for an appearance gain or some other benefit that is of importance to him, that would seem to us to be his decision to make and not a matter of public policy.

If I may, Mr. Chairman, interrupt the prepared statement, I described a possible \$24 reduction on a Galaxie in the first year in Washington, D.C., in that table.

If you move to Cedar Rapids, Iowa, which is a far lower cost insurance area and you assume that the insured has purchased a Pinto instead of a Galaxie, the collision premiums on a Pinto are \$48 in the first year and they drop to \$36 in the second and third year.

That means the consumers' savings, if all insurance companies gave the 20-percent reduction that a single insurance company has offered, would be about \$10 in the first year on a Pinto, about \$7 in the second or third year, and all of \$6 or \$5 in the fourth, fifth and sixth years.

This matter of consumer choice is one that we think is important. We think it is very possible that a buyer of a car like the Galaxie in a high insurance cost area like Washington, D.C. would want to purchase a high-impact bumper. We think it is far less probable that a buyer of a far less expensive car in a much lower insurance cost area would want to have exactly the same requirement imposed on him.

SENATOR PASTORE. Is there a relationship between this damage and the question of personal injury? We seem to be overlooking that.

For instance, if a car can be damaged, it means that the susceptibility of injury to the individual is the greater, isn't it? You keep talking about premium cost. How about the human element here?

Mr. NEVIN. Senator, when the Department of Transportation recently promulgated I believe a 5-mile-an-hour front bumper standard and 4-mile-an-hour rear bumper standard, the basis of that promulgation was the possible damage to safety-related components.

I think that the Department made no suggestions, sir, that there was any impact on passenger injury. As a matter of fact, one of the technical problems that the industry is faced with in dealing with this problem of damageability is to find designs in bumpers that will absorb energy and not require that the passenger or the occupant absorb it.

The problem, sir, is technically the reverse. To the extent that that sheet metal is crumbling in the automobile, it is absorbing energy. As it absorbs energy, that is energy that the occupants are not going to absorb as they crash into instrument panels or something else.

Senator PASTORE. Do I understand you correctly? You are telling me that if you have a bumper that can be easily damaged or more easily damaged, the susceptibility to personal injury becomes less, is that what you are saying now?

Mr. NEVIN. No, I did not mean to say that.

Senator PASTORE. That is the way I understood you.

Mr. NEVIN. What I said—

Senator PASTORE. You are talking about absorption of energy. Who is to absorb it, the bumper or the individual?

Mr. NEVIN. Let me see if I can restate it, because I apparently was not clear.

First, in answer to your question is passenger injury wrapped up in a bumper standard. I would answer your question negatively, sir. The Department of Transportation in promulgating the standard made no representation whatsoever that passenger injury was involved. The basis for the standard related to the Safety Act was that safety-related components might be damaged in the collision.

S. 976 provides for inspection of cars after an accident which would accomplish the same objective. But there was no representation by the Department—

Senator PASTORE. Let's forget the Department's representation. You are representing the Ford Co., you are speaking here as an individual. Let me ask you: Is all this related in any way to the personal injury of the individual driving that automobile, regardless of what it means on premium rates?

Mr. NEVIN. No, sir. Ford has no information to suggest that the damageability characteristics of an automobile relate to passenger injury, and we know of no evidence that has been presented by the Department of Transportation or anybody else to suggest there is any such relationship.

Senator PASTORE. Have you made any studies along this line?

Mr. NEVIN. Yes, sir, I started to describe those studies.

The studies we have made indicate that one of the technical problems, not a problem that I am going to represent to you is nonresolvable, but one of the technical problems we will have as we try to improve the damageability characteristics of automobiles is to accom-

plish designs that permit that improvement without reducing their passenger injury characteristics.

But the two objectives are contra one another in terms of design and those problems must be resolved, sir.

Senator HARR. On that point, I am grateful the Senator from Rhode Island raised it. On Friday last there was testimony from the Cornell Aeronautical Lab far too technical for me to inhale on Friday afternoon, but hopefully all of us can better understand it as we read the record, that suggested that there was a compatibility between the safety to occupant and the damage avoidance design and construction of the vehicle.

The one thing that he emphasized that I do recall was, we must seek to avoid a bounce-back effect involving the occupant.

Mr. NEVIN. I do not think it is appropriate for me to comment further. As you know, I am not an engineer, and I probably should avoid trying to take a technical position here. I am sure it varies depending on what speed you are talking about and how much damage you are trying to prevent at what speeds.

If an automobile buyer elects to accept a damageability risk in exchange for an appearance gain or some other benefit that is of importance to him, that would seem to us to be his decision to make and not a matter of public policy.

Ford doubts that the requirement that vehicles be equipped with 5-mile-per-hour bumpers will result in commensurate savings to the consumer. The single automobile insurance company that has committed to a reduction in premiums for cars equipped with these bumpers has stated that that reduction will be limited to 20 percent of collision premiums.

In 1969, collision premiums collected by the companies included in Best's Aggregates & Averages totaled \$2.7 billion. In 7 or 8 years, when almost all insured vehicles are equipped with such bumpers and if all insurance companies provide the 20-percent reduction on collision premiums, consumers might save \$540 million annually.

During the next several years, when only recent models will be equipped with such bumpers, insurance savings will be far lower. If Ford's belief that a price increase of about \$100 per car to provide 5-mile-per-hour bumpers is accurate, the consumer is unlikely to recover, through insurance savings, the added costs he incurs at the time of purchasing a new car.

A 20-percent reduction in all collision premiums would have the effect of ultimately, when all cars have the new bumpers, reducing total automobile insurance premiums by only 4.7 percent. In recent years, automobile insurance premium costs have risen by close to twice that amount each year. If the consumer is to benefit from the new bumpers, very major gains would have to accrue to uninsured motorists or to persons incurring costs as a result of collision coverage deductibles.

The data published in Best's Aggregates & Averages suggest that if the objective of the bill is to accomplish a reduction in insurance costs and, thus, in the costs of automobile ownership, the establishment of damageability standards for new cars should not constitute the initial course of congressional action.

The insurance companies whose results are reported by Best spent some \$12.3 billion in 1969. Of that total, \$4.5 billion was spent in ma-

terial damage payments to policyholders; \$3.3 billion was spent in bodily injury payments to policyholders and \$4.5 billion was spent to cover the administrative and selling costs incurred by the insurance companies themselves.

The data included in Best's *Aggregates & Averages* indicate that 36 cents of every insurance expenditure dollar was used to cover overhead costs and not to reimburse the policyholder. Even that estimate of the cost of delivering benefits may be understated. An extensive and detailed Department of Transportation study indicates that, of the \$3.3 billion paid out in bodily injury claims to policyholders, close to \$1 billion was used to cover legal expenses.

The costs incurred to deliver benefits to an automobile insurance claimant are considerable. If the calculation of benefits paid considers legal costs to be a benefit rather than an expense, the automobile insurance industry incurred a cost of \$4.5 billion in 1969 to deliver \$7.8 billions in benefits. Expressed differently, the insurance industry incurred a cost of \$58 for each \$100 of benefits it delivered to policyholders.

If the almost \$1 billion in legal fees are considered to be an expense of the system rather than a benefit, the industry required \$5.5 billion of expense in 1969 to deliver \$6.8 billion in benefits. On this basis, \$81 of overhead cost was required to deliver each \$100 of benefits to policyholders.

Ford understands that it costs about \$20 to deliver \$100 of benefits under private health and accident plans, about \$8 to deliver \$100 of benefits under Blue Cross plans, and about \$3 to deliver \$100 of benefits in the social security system.

Moving now to standards to facilitate inspection and repair. Section 128 of S. 976 requires the Secretary to "as soon as practicable, promulgate Federal motor vehicle safety and property loss reduction standards which require that all motor vehicles manufactured after Jan. 1, 1975, and offered for sale in the United States, are so designed and constructed as to facilitate motor vehicle inspection and to facilitate the repairs necessary to meet the requirements of such inspection."

When the 1966 act was passed, Congress determined that vehicle safety standards should be performance standards and that the Government should not become involved in determining how cars are designed and constructed. Proposed section 128 of this bill appears to contradict that determination with respect to the repairability and inspection characteristics of an automobile.

Differences in the time required to inspect or repair vehicles are very frequently directly related to differences in vehicle features and equipment. A Mark III is substantially more complex than other vehicles offered for sale by Ford and often more difficult to diagnose and repair. We believe that the buyer of a Mark III understands that he has accepted those compromises and believes those compromises to be reasonable relative to other advantages he finds in the vehicle.

We don't believe that the public interest would be served by either directly involving Government in the design and construction of vehicles or by limiting the consumer's right to make choices in these areas. We are, in fact, aware of no special difficulties in inspecting motor vehicles for safety performance that would be eased through economically justified changes in car design. Ford does not, therefore, support this portion of S. 976.

## VEHICLE SAFETY INSPECTION AND UNIFORM CERTIFICATES OF TITLE

Section 501(a)(1) of S. 976 requires the Secretary of Transportation to "not later than January 1, 1973, amend Highway Safety Program Standard No. 1, relating to periodic motor vehicle inspection" \* \* \* to \* \* \* "require inspection of a motor vehicle whenever the title to the motor vehicle is transferred for purposes other than resale and whenever the motor vehicle sustains damage if any safety related mechanism, subsystem or functional nonoperational part as defined by the Secretary is damaged."

Section 501(a)(3)(b) requires the Secretary to "not later than January 1, 1973, amend Highway Safety Program Standard No. 2 \* \* \* to include requirements for a State motor vehicle registration and uniform certificate of title program \* \* \*."

Ford has actively supported mandatory vehicle safety inspection and uniform certificates of title for many years. We support these provisions of S. 976. We believe, however, that there is merit in requiring periodic inspection, rather than requiring inspection only before resale and after an accident.

As a matter of fact, if we were to make a recommendation to you it would be both periodic inspection and inspection after the accident and eliminate the requirement at the time of resale, so that the car that stayed with one owner for 6 or 8 years would be subject to inspection.

We do not believe that the requirement that garages, service stations and dealerships be precluded from serving as inspection stations is in the public interest. The diagnostic equipment and the manpower skills required to provide effective inspection and repair of motor vehicles are interchangeable, expensive, and, in many parts of the country, in short supply. Business outlets repairing automobiles will require the same equipment that is used to inspect vehicles in order to make certain that repairs have been accomplished in a manner that will meet inspection demands.

The requirement that inspection stations be businesses not engaged in vehicle repair would add consequentially to the costs of the inspection program and probably add significantly to the inconvenience a consumer must accept in order to meet inspection requirements.

Again if I may interrupt and depart from the testimony, I understand that the committee is considering an amendment to this inspection requirement that would incorporate a requirement to inspect vehicles to determine their air pollution characteristics, to determine that air pollution standards were being met.

The Environmental Protection Agency I believe is now deeply involved in a study to develop the kind of equipment and diagnostic techniques that might accomplish that objective in the field. I suspect that that will be a difficult technical job. I suspect it will require very skilled people; I suspect that it will require some rather sophisticated equipment.

Under these circumstances, we think, Ford believes that it would be unfortunate to say that those people must be employed separately in diagnostic stations and in places that do not do repair work. The same technology, the same personnel skills, the same equipment is certainly going to be needed in the places of business that attempt to

accomplish whatever repairs are needed to bring the car up to the standard.

We assume that the requirement that inspection stations be separated from garages is designed to prevent frauds associated with inspection reports that require the consumer to pay for unnecessary repairs. We believe that the objective of avoiding such frauds could be more economically attained through programs designed to monitor the performance of the outlets licensed to perform inspection services.

Much of our concern with the provisions of S. 976 results from conclusions we have reached with respect to the probable cumulative impact on new car prices of actions that would be required or authorized by S. 976 and actions that are now required to achieve air pollution control and safety objectives.

It can be demonstrated that changes in the design of automobiles have produced considerable improvements in their average emission characteristics. Carbon monoxide and hydrocarbons were the first automotive pollutants to be identified and controlled. Vehicles produced prior to controls emitted about 77 grams of carbon monoxide per mile; today's vehicles emit less than 25 grams per mile, a reduction of 70 percent. Cars produced prior to controls emitted about 16 grams of hydrocarbons per mile; today's vehicles emit less than 3 grams, a reduction of 83 percent. Cars produced beginning in 1973 will emit oxides of nitrogen at rates about 44 percent below those of cars produced prior to controls.

There is less compelling, but very encouraging, evidence to suggest that gains are also being accomplished in reducing traffic fatalities. In 1970 the absolute number of traffic fatalities in America declined despite an increase in automobile usage.

While significant gains have been made to date in controlling automotive pollutants and in reducing highway fatalities, the industry is now involved in efforts to meet even more stringent Federal standards that will be effective in 1973, 1974, and 1975.

The 1970 amendments to the Clean Air Act require that automotive pollutants be reduced to levels about 95 percent below the levels that existed prior to controls.

In addition to other safety-related actions, we are attempting to improve occupant protection features of our products to accommodate, as fully as possible, the objectives of a new standard that requires fully passive protection of unbelted occupants in crashes at speeds up to 30 miles per hour.

Needless to say these are substantial technical tasks.

S. 976 would establish a third set of goals. It should, in our opinion, be evaluated in terms of its possible cumulative effect on car prices during a period in which the consumer will be confronted with substantial price increases as a result of higher priority air pollution control and safety-related actions.

During the 1966-67 period, the prices of new cars were increased as a result of requirements that windshield washers, backup lights, outside rear view mirrors and other equipment, that had previously been optional, be installed on every car in America. The actions that have been taken in more recent years to improve automobile safety and reduce automobile pollution have also had an impact on car prices.

In 1968 the Bureau of Labor Statistics recognized a \$70 increase in the retail price of the average American car as being the result of added safety and emission control devices. The cumulative impact of safety and emission-related retail price increases, recognized by the Bureau of Labor Statistics, totals \$162 for the 1968-71 period.

The Environmental Protection Agency estimated, in a recent report to the Congress, that emission control devices to be added between 1972 and 1975 will add about \$223 more to the price of American cars. The estimate is probably too low, but it is adequate for the purposes of this testimony. Ford estimates that the addition of passive restraint systems and other safety devices, exclusive of high impact bumpers in the 1972-75 period, will add an additional \$100 to \$250 to the price of the average car sold in the United States.

By 1975 Ford would estimate that the price of the average American car will have been increased by from \$450 to \$600 to accomplish national air pollution control and safety objectives. That increase is in current dollars; it does not provide for the effects of inflation. If it is assumed that new car sales volumes will average 10 million units per year during the next decade, the American public will pay from \$4.5 to \$6 billion annually to finance these programs. All but approximately \$1.5 billion of that annual expenditure will be added during the next 3 years.

To summarize Ford's views:

Ford's inability to support many of the provisions of S. 976 results from a desire to protect the consumer's right of choice, and a desire to avoid the risk of unnecessary further increase in the prices of new cars. It would seem appropriate to summarize our views with respect to these two issues.

Ford is aware of the fact that large numbers of American consumers place a very high priority on repairability and damageability in evaluating the relative merits of the automobile offerings that compete for their attention.

We have placed considerable emphasis on repairability in the design of the Maverick, Pinto, Comet, and Capri car lines that we have recently introduced in the United States. That emphasis has been directly rewarded through increased sales and profits. We do not believe that compulsory repair standards are necessary to assure the consumer of the opportunity to choose a new car that offers advantages in this area. We are concerned that such standards would prevent the consumer who places higher priority on other vehicle attributes from exercising his choice in the market.

We are also aware that very large numbers of American consumers will place great emphasis on damageability characteristics when they purchase a new car. We doubt that any seller of automobiles in the United States could hope to compete successfully in future car markets unless a significant portion of his product line offered advantages in the damageability area. We do not believe that compulsory standards are necessary to provide the consumer, who seeks these attributes, with the opportunity to find a suitable product when he enters the market. We fear that the effect of compulsory standards will be to unnecessarily restrict the choice available to consumers with other interests.

We have noted that we see no reason why the buyer of an American made car should not be permitted to accept a compromise in damageability in exchange for vehicle features that are more important to him. Similarly, we see no reason why an American consumer should be unable to purchase a Jaguar or a Mercedes if low volume overseas producers found it uneconomic to meet American damageability standards but offered offsetting values to attract the American consumer.

If, in the future, a car manufacturer decided there was a market for a car that was significantly less damage resistant than competitive models, but offered other appeals, we assume that the insurance industry could impose a surcharge when establishing premiums for that car in much the way it now imposes a surcharge for cars equipped with high performance engines. If the consumer found the other appeals of the new model overriding and accepted the surcharge, we see no reason for legislation that would prevent the exercise of that choice.

Again if I may depart from the testimony Senator I think that there is a parallel to the approach that Ford suggests in fire insurance coverage for a home and in such things as a homeowner's policy.

I am going to use cities that may not be familiar to anyone except Senator Hart, but in the Detroit area if a man buys fire insurance on a \$15,000 home for 1 year in Detroit he pays about \$29.60 per year. If he moves out to Hazel Park or to one of those suburbs, he goes up to about \$31. In Southfield and Bloomfield, he goes up to about \$37. If he moves out to Franklin Village he is at \$48. So, he is now paying a premium of \$48 where he could pay \$30 in Detroit. If he moves to a completely rural area, he pays \$57 for the same coverage.

In a homeowner's policy, if a man buys an all masonry home and insures it for \$15,000 in Detroit, he pays \$45. If he insures a frame home in a rural area, he will pay \$68 for the same coverage. What we are really urging is that the effort of the Congress to make sure that the consumer has information with respect to the insurance premiums he has to pay and with respect to the costs he is incurring to exercise any other option at the time of car purchase rather than establishing a standard that would make cars identical.

With respect to price increases, Ford believes that actions taken to accomplish national objectives in the safety and air pollution areas will have an impact that is so sizable as to require that every effort be made to avoid additional actions that might lead to further increases. Even though it can be assumed that there is wide public support for the safety and air pollution control programs that will lead to these increases, there is a point at which the consumer's ability to pay becomes a critical consideration.

In our opinion, there is a considerable risk that the price increases required to meet safety and pollution objectives and those that will be required to offset the effects of continuing inflation during the next several years may be so sizable as to exceed the ability of many consumers to pay. If that were to happen and the effect were to be a decline in new car sales volumes, our country would suffer in several ways: First, the achievement of national objectives in the air pollution control and safety areas would be seriously delayed. The cars being produced by the industry today are both safer and more pollutant-free

than the older cars that they will replace on the American highway. A decline in new car sales volumes would have the effect of deferring the replacement of the older vehicles that are the most serious contributors to safety and pollution problems.

And, second, a serious decline in new car sales would also have adverse economic effects that would extend well beyond the automobile industry. An automobile slowdown would affect thousands of supplier plants in dozens of supplier industries throughout the country.

Such an economic reversal would produce unnecessary income losses for the employees affected and result in reduced tax revenues at the municipal, State, and Federal levels of Government with attendant adverse effects on the ability of the governments to fund a wide variety of needed programs.

That concludes our testimony. We are grateful for the opportunity to appear today.

Senator HART. Mr. Nevin, thank you.

Most of all thank you for being explicit in the position that Ford takes on the several proposals and legislative enactments. As I get it, the thrust of your opposition with respect to the authority vested in the Department of Transportation to set safety property loss standards hinges on the fact that the engineering resources available that could be put to the job of property loss reduction are tied up in attempts to meet the safety and air pollution standards, that there is a limit to the resources; and, second, that you anticipate that the cumulative price impact of safety requirements, emission requirements, and property loss reduction and vehicle inspection requirements would be a disservice to the consumer or put it another way it would dampen car sales; and, third,—well, you question the desirability of requiring everybody to buy cars with minimum property loss reduction standards that are federally required, suggested that those requirements restrict really consumer choices; and, finally, that the proposed bill S. 976 really offers no substantial promise of offsetting reductions in insurance and repair costs.

Have I fairly summarized your statement?

Mr. NEVIN. That is a very fair summary of the points I have attempted to make, sir.

Senator HART. So we can evaluate it—and I wouldn't anticipate that you can give me the answer to the question that I am going to ask you, but we would ask you to provide it for the record—would you tell us how many engineers Ford Motor Co. now employs, and of the total how many are working on safety programs, emission control, and design features, the three categories?

Mr. NEVIN. Yes, sir. I will attempt to get you a specific answer. I think I can give you a general answer. The air pollution standards the Congress has set for the 1975 period, of course, involve the carburetion system of the automobiles, all the engine systems; the great bulk of the power and exhaust systems are wrapped up in that.

Regardless of what work an engineer is doing on a car that is going to be produced in that period, he must be concerned with the impact of that work on our ability to meet that standard. So, in terms of the power train components I think the statement could be made—and I wouldn't want to literally prove it—that there is no engineer concerned with carburetion or the power kind of components of the car who

doesn't have to be concerned with the air pollution objective, because that's where the problem is—in exhausts.

When you get to the safety standards that have been promulgated, when you talk about passive restraint systems, and you understand what I am talking about here, a system that will protect the occupant without belts, you must consider major redesigns of the instrument panel of the car and the interior of the automobile, and by the time you move from there to the bumper regulation that has already been imposed, you have begun to define design parameters of the front-end sheet metal.

I am not trying to give you an offhand answer and I will try to answer it for the record, but I am only trying to describe for you, by the time you take these two major Federal objectives, safety and air pollution, I think the representation we have made that meeting Government standards in these areas will require a completely, virtually complete, redesign of automobiles, is a fair representation for the committee's consideration.

I will do what I can to get you a more specific answer, sir.<sup>1</sup>

Senator HART. I am impressed and am reminded by your testimony of the intensity of the manufacturer's efforts to design a vehicle that does enhance the safety of the occupant and in more recent days your concern about design for repairability.

Where I disagree with Detroit is that this concentration of effort is principally the result of what Detroit thinks is an unfair intrusion by the Congress in its business. I salute and I anticipate the kind of figures we will get on those engineers, but certainly in the period of time I have been here, until we really looked serious about doing what so many in Detroit felt was outrageous, there wasn't this kind of concentrated drive.

Are you game to react to that?

Mr. NEVIN. Yes; but carefully. Let me avoid your direct question, Senator Hart, as to whether Detroit in previous testimony responded in the way it might wish it today had to these public objectives.

Whatever answer I gave to that question, I think you and the other members of this committee would agree that you have now taken sufficient action to get our attention. I think there is no question but that the standards that have been established for the middle seventies in air pollution and in occupant safety are not subject to quarrel between us and the Department of Transportation or the EPA in terms of whether they are terribly demanding standards.

There may be some fringe quarrels as to whether this can be done or whether that can be done or what the number would be, but I think there would be no responsible administrator in either of these programs who would come to this Congress and say anything other than that these are terribly demanding standards that do encompass substantial reengineering of major vehicle systems and in some cases virtually complete reengineering of cars.

I have to agree, I ducked your basic question and tried to answer one close to it.

Senator HART. Thank you for that.

Back to the subject matter more directly here, you indicated that the total cost to the consumer of these several standards that we are

<sup>1</sup> See p. 1391.

talking about would be that the cost benefit wouldn't be there. If the Federal Government required every car to have bumpers able to take a 5-mile-an-hour barrier crash without damage, what price at retail would that bumper protection carry?

How would you price it?

Mr. NEVIN. Ford's estimate at this point in time, Senator, for 5-mile-an-hour front and rear, our estimate is that will have an impact on car prices of approximately \$100 at retail.

That is an estimate. I think it is the most accurate answer I could give you to your question, and it is that kind of an estimate with respect to cost that, particularly in the case of a car like a Pinto, leads us to believe that if the policyholder is going to get a \$10 insurance premium reduction the first year, \$8 the second and third year, and \$6 in the fourth and fifth, that there is merit in the Congress pursuing the proposal of this legislation which is to ask the Secretary to study damageability characteristics.

I must be candid with you, I don't hold out much hope for that study, sir. I think when property insurance companies have been rating the fire risk in houses depending on whether it is brick or frame and depending whether it was close to water or not and what kind of fire department it has had for years, when the insurance industry has had a chance to rate the safety characteristics of the car through 5 years of very intensive Government action to improve the safety characteristics of the car and has found no reason to reduce premiums, I must say I think when they get done with the study those rating characteristics that they assign to the characteristic of the driver, whether he has got a bad accident record, his sex, his age, the kinds of things they now use, will remain so dominant—and I hope you understand I am not trying to be critical of the industry, I honestly don't believe they will find from one car to another differences that are so substantial as to base ratings, to use them, and I guess the one piece of evidence I would bring to your attention besides their past performance is even where they have brought to the Congress data as to what it costs to repair Ford, Chevrolets, Plymouths in 5-mile-an-hour accidents, 10-mile-an-hour accidents and 15-mile-an-hour accidents, I think you would agree, sir, there is a remarkable similarity in the cost which suggests that this is what at the current level of design it takes to correct that kind of damage and there is no evidence to my knowledge of dramatic differences of one car to the other.

Senator HART. They are all too high is the reaction of the audience. Not to hold you to any more precise figure than about \$100 retail, what would that 5-mile-an-hour bumper add to the price at wholesale?

Mr. NEVIN. I would judge that if the \$100 number is at retail, the wholesale number would be in the order of magnitude of \$80. Some of our cars have a 25 percent discount; some of them have a 17 percent discount. Depending on the car line, \$100 at retail would perhaps range from \$75 to \$83 at wholesale.

I may be getting more accurate than I should be.

Senator HART. The record may be corrected.

Mr. NEVIN. So long as you accept it as a ballpark kind of answer, I am happy to give it to you.

Senator HART. I will ask a ballpark question. The Bureau of Labor Statistics would indicate that the wholesale price on at least safety

related changes has been double; that is, if it was \$100 at retail for that bumper it would run about \$50 at wholesale.

That is not your impression?

Mr. NEVIN. That is not my impression, sir. I would be happy to correct that for the record.

As a matter of fact, I believe that the basis on which the Bureau of Labor Statistics makes this judgment is to evaluate the retail increase first and then fall out the wholesale impact on the basis of the relationship between our selling prices to dealers and the suggested retail prices.

But I will be happy to give you a more definitive answer.

(The following information was subsequently received for the record:)

The estimated wholesale and retail price relationships for the five-mile-per-hour bumper are consistent with the wholesale and retail prices for safety items submitted to the Bureau of Labor Statistics and on which ultimately retail price announcements were made by the Bureau of Labor Statistics.

Ford Motor Company's wholesale prices range from 70% to 78% of suggested retail prices, depending on the car line. The difference between the price levels represents dealer margin and excise taxes only. Ford's communication to the Bureau of Labor Statistics, including safety and emission items, is on both a wholesale and retail price basis.

Senator HART. The Senator from Rhode Island.

Senator PASTORE. In your statement, you say "By 1975 Ford would estimate that the price of the average American car will have been increased by from \$450 to \$600 to accomplish national air pollution control and safety objectives."

Have you any figures that would indicate by 1975 what the cost would be to the consumer because of styling?

Mr. NEVIN. Yes, sir. I believe that the amortization and special tools—now, I am going to use special tool amortization, Senator, because that is the best measure I can give of what it costs to style a car—the amortization of special tools in our 1970 financial statement totalled \$400 million and that is against \$14,900,000 of sales. So tool amortization the writing off of tools that have been disposed of because of styling changes, amounts to about 3 percent of total Ford Motor Co. sales.

We have announced publicly, sir, that we will reduce the rate of styling change in the future both to conserve engineering resources and to minimize the kinds of costs that we have to pass on to the public. The opportunity for reduction here in my judgment has been overstated. First, it is only 3 percent of sales and, second, there are very major tooling expenditures in the automobile industry associated with the accomplishment of these standards.

The accomplishment of the standards is not limited to a variable cost penalty, something you buy from another manufacturer and simply hang on to the car. When you put a 5-mile-an-hour bumper on the car, it is frequently necessary to restyle the front end of the car so that the fenders are protected by the bumper.

I am not exaggerating when I tell you, sir, that there are now in our styling studios cars with appearance changes that we had not planned. We had not planned to change the appearance of the car, but, because of the requirement that we have a 5-mile-per-hour bumper on the car, we either got, without wanting it, a changed appearance in the re-

design required to accommodate that bumper or we were able to get an appearance change at no additional cost because every piece of metal had to be changed anyhow.

I think the best direct answer I can give you is every effort is being made to save here in terms of styling for styling sake, that it is only 3 percent of sales to start with, so it cannot have an enormous impact and some of the effort to save will not show up in terms of cost saving because the tooling expenditure must be made for another purpose, the far more legitimate purpose of meeting a public objective.

Senator PASTORE. I would like to have an answer that is related to the cost, if you can. If you cannot do it, that is another thing, too. You are very explicit here in giving the layman the idea of what these national air pollution and safety objectives will cost the consumer by the year 1975 and you relate that to an individual car, and you stated it is between \$450 and \$600. Now, this dissertation that you just gave me, could you reduce that in terms of what it would cost for the individual car by 1975 so that the man who buys a car can understand that?

Mr. NEVIN. I will attempt to do that.

Senator PASTORE. If you cannot do it now, would you put it in the record for us?

Mr. NEVIN. I think I can attempt to do it now. I start from the 1970 number of \$400 million of tool amortization against \$15 billion of sales. Approximately 3 percent of our cost is in tool amortization. If you assumed we had no tools, which of course would not be true, we would still have to stamp out the car, but just assume none, we could have reduced car prices by 3 percent, \$90 on a \$3,000 car.

Now, I think the answer to the question, the answer I was trying to give you was that we hold little hope that there will be consequential offsets in tooling costs by the middle 1970's that could be passed on to the consumer, and the reason is not that we continue to restyle the car but, rather, that the tools are being bought except the purpose of purchasing those tools differs now. Instead, to have the front end round instead of square or something like that, the tools are being bought to redesign the car to achieve some structural objective related to damageability.

Senator PASTORE. Why is the styling changed so often? Is it to meet competition, is it to create jobs, or what is the reason for it?

Mr. NEVIN. I think that the automobile industry has thought—and I am using the past tense here—has thought that it was dominantly a style industry through many years. I think there is—I won't say think—I am certain there is enormous evidence to suggest today that there are large numbers of American consumers who no longer regard their automobile as a style item, who seek pure function. As we design cars like the Maverick and the Pinto, for example, we simply made the statement that the rate of styling change is going to be far less than it was in the past. You have probably noted, and if you have not yet you will in the future, but even the rate of styling change on the higher-priced American cars has been reduced. I think the reason for that change in approach in the market derives from several factors. First, large bodies, of consumers are simply not interested in. I guess it was in 1955 that you could say that the American public paid close to \$20 million to get wraparound windshields. I don't think that

would happen today. I do not think there is a styling feature you could put on a car that would cause consequential numbers of Americans to say I have to have that. The emphasis is far more on the cost of ownership and on reliability.

The attempt to conserve engineering resources to avoid cost in a time when we are critically concerned with costs contribute further. I hope you don't misunderstand the dollar data on price increase I presented to you, Senator.

Senator PASTORE. I don't think I did. You said it cost about \$90. You multiply that by four or five to get a total figure in 1975?

Mr. NEVIN. It is about \$90 per year.

Senator PASTORE. And if you multiply it by four, it comes out about the same, doesn't it?

Mr. NEVIN. No, sir. It is \$90—the \$400 million is a single year.

Senator PASTORE. That is what I am talking about. So to get 1975, you multiply that single year by four?

Mr. NEVIN. No, sir. It's not cumulative.

Senator PASTORE. You mean to tell me that the styling will cost the consumer only \$90 by year 1975, the change in styling?

Mr. NEVIN. To be more exact, sir, the translation to a \$3,000 car may be modestly inaccurate, but to be more exact the cost of special tooling to the Ford Motor Co. in 1970 represented about 3 percent of sales; and I would say that special tooling on a \$2,000 car accounted for \$60 of its cost; on a \$3,000 car, \$90 of its cost; on a \$5,000 car, \$150 of its cost.

I was trying to use that number, because that is where we are today.

Senator PASTORE. I know it, but that is 1970.

Now, how about 1971? How about 1972, how about 1973?

Mr. NEVIN. I can honestly hold out to you no hope for any consequential reduction, because I think the level of tooling we are going to have to amortize each year will at least stay constant except the reason for the amortization will not be that we decided we wanted a different shape fender but rather that we were meeting some new standard for the next year which required that the car be retooled in order to accomplish the objectives of that standard.

Senator PASTORE. Are you saying to me that while it will cost between \$450 to \$600 to accomplish the goals that have been set for aid pollution and safety, insofar as styling is concerned, there will be no additional cost?

Mr. NEVIN. Yes, sir. I think I have to agree with that, there will be no offset as a result of reduced tool expenditures even though the rate of styling change will be dramatically reduced.

Senator PASTORE. I will be here in 1975 with the grace of God and I will ask you the question again.

Mr. NEVIN. Yes, sir.

Senator PASTORE. And I don't mean any impertinence by that, but it is hard for me to digest that statement, that insofar as styling is concerned, by year 1975 the consumer will not pay a nickel more than if you had remained the same. I just cannot digest that statement.

Now, I come back to the same question again. Why is the styling change at all? Is it because it is better to create jobs and keep more people working, because it improves the esthetics of the industry, or is it done to meet competition, both domestic and foreign?

Mr. NEVIN. I think that the basic——

Senator PASTORE. You see there are some people who feel we change our styles too often and this is carried on the back of the consumer. Then there are other people who say if you don't change the style, it means you don't have to manufacture more tools, and a lot of tool industries will be hurt.

I was wondering whether a study had been made of this to bring it in more or less proper perspective?

Mr. NEVIN. I think there are two results of a styling change. First, let me answer your question, I would have to say that the major reason for styling change in the past has been the belief that a fresh, new look would attract the consumer.

That has been the overwhelming reason.

Senator PASTORE. Yes, sir. There has been both an adverse and what I would hold out to you a beneficial effect of that on the American consumer, on the consumer, not on the automobile companies. The effect of this, and I will use subjective terms, adverse, the man buying a new car has tended to pay a premium for it; he has paid more money because it was restyled, but that styling change re-created in America something that is a phenomenon not available in the automobile market in the rest of the world to any such extent is the used car market.

The process that led one group of Americans to say I will pay a premium to buy this car which is new, and you may not or I may not agree that we will use our money to do that, but these Americans said they would also lead that group of Americans to dispose, at the end of a year, or 2 years, of a car that had an enormous remaining life in it, perhaps as much as 80,000 miles or 75,000 miles and permitted another group of consumers with different sets of values who said I don't care about styling change, I would rather have a 2-year-old Ford and save \$600 or \$800—I don't know what the exact number is—to buy that car. That phenomenon does not exist in European automobile markets to anything like the same extent.

The rate of styling change doesn't lead to the same rate of car replacement. As a result, a consumer in order to buy a car must be prepared in most instances to pay the new-car price.

I would hold out in a society like ours in which an automobile is so often a necessity as opposed to simply an optional decision on the part of a consumer that there has been an economic benefit to that. The man who didn't want style could buy a very much cheaper car in the market.

Some of our critics in this area of style sort of draw a picture for the Congress of all the 2-year-old cars in America being driven off a cliff somewhere into the ocean.

That, of course, is not true. Those cars do stay on the American road 10 years, they do move through the hands of perhaps three or four owners, and each of those owners with a different set of values or perhaps a different set of economic capabilities makes a judgment, I would rather have a 2-year-old car and give up the prestige or whatever other attribute he sees in it of a new car because that is a better value to me.

The historical reason for the styling change I have to say was a marketing reason. It was believed that it would attract more new people to our showrooms and sell more new cars.

Senator PASTORE. Has the industry changed that as a result of a lesson we have learned from foreign-made cars?

Mr. NEVIN. I think in part, and I think it is also a function of the number of cars that are offered. It was not more than a decade ago, Senator, that Ford offered a Ford car for sale and Chevrolet offered a Chevrolet car and Plymouth offered a Plymouth car and there was one car you associated with a dealership.

Now, you go into a dealership and you find as many as four or five different kinds of cars. We have got the Thunderbird, the Galaxy, and so forth. Ford has six different kinds of cars.

Six years ago you could run a picture in Life magazine on introduction day and say here is the new Ford and most of America 2 weeks later would know what the new Ford looked like. I do not think it is true anymore. With each maker having six or seven different kinds of cars, most consumers have doubts about what the difference is between perhaps one or two of the cars we made last year, much less what the styling differences are between this years model and last years model.

So, the advantage of styling change as a marketing tool is changing because of the variety of cars offered in my opinion now—I am answering subjectively—the demand for it is changing because so many more Americans are looking for more functional values, and our capability to provide it is changing because of our desire to hold down prices and to meet these other more pressing demands.

I think all those things are working in the same direction, which is to reduce the rate of styling change. My response to your prior question, sir, was only to indicate that I did not think that was going to have a dramatic effect on price in the near future.

Senator PASTORE. Relating this to number of jobs, would the number of jobs be affected considerably if we didn't change our styling so often?

Mr. NEVIN. No, sir.

Senator PASTORE. It wouldn't?

Mr. NEVIN. No, sir.

Senator PASTORE. It is not related at all? I mean appreciably?

Mr. NEVIN. I am going to reach for a number, but I think that probably we are going into an area where substantially more than 75 or 80 percent of new car sales will represent replacements of cars. You know, it isn't new families deciding we want to own cars. We have an economic society where most families do own a car.

I think the combination of the growth in the number of families in America, replacement of cars that are already on the road would suggest that automobile sales would not be appreciably affected over the longer term by reduced styling.

I do not expect that to have an adverse impact. To the extent we give a consumer other values he seeks, it could have a favorable impact on jobs. That is a terribly subjective answer to your question, but I wasn't prepared factually to answer it.

Senator PASTORE. Thank you.

Senator HART. The Senator from Kansas.

Senator PEARSON. Thank you, Mr. Chairman.

I first want to associate myself with the Chairman's complimentary remarks concerning your testimony. I recall that when this committee

a year or so ago addressed itself to legislation concerning standards of quality for automobiles and warranties Mr. Nevin was the only industry spokesman who came up to help us make a record on that subject.

These hearings deal with the question of safety, with the inevitable damages to property, injuries, loss of life. We have sought, as lawyers say, to make the parties whole. And for a long time our instrument to do this has been insurance.

But this system now is breaking down high premiums and limited coverage. So I take it, from your testimony this morning Mr. Nevin, that it is the position of your segment of the automobile industry that the burdens upon you to meet the new safety standards, and the burdens upon you to fulfill the requirements of the elimination of auto pollution are so great that that is about all the industry can do now without the added responsibility of solving the insurance problem.

MR. NEVIN. Yes, sir, but further than that—

Senator PEARSON. But there is an indirect aid in the safety improvements that you are making pursuant to the Federal requirements?

MR. NEVIN. I would hope my testimony would not be understood by the committee to represent an automobile industry versus the insurance industry position. The insurance industry—

Senator PEARSON. I understand that. I stated it poorly.

MR. NEVIN. No, I just wanted to make sure it was understood. The insurance industry, as I understood it, best aggregates again, suffered an underwriting loss of 700 million last year. In other words, what they paid out exceeded what they took in in premiums. No business enterprise is going to continue on that basis, and it is going to result in more uninsured motorists and more price increases. I simply doubt here that there is evidence available based on the bumper standard and the indicated savings to policyholders, based on the cost structure of the industry, that the savings you seek in insurance costs can accrue to the American public through changes in car design in the near term.

The first disadvantage we have is there is no way we can change that car population that the industry is insuring for 7 or 8 years. Even when we take a dramatic kind of step, dramatic relative to past steps, the impact on insurance premiums, 4½ percent, the number I quoted in the testimony, is so small relative to the rate at which insurance costs are increasing each year. If the insurance industry was making a fortune and increasing rates at that kind of rate, I would have a different kind of testimony. But there is no evidence they are doing that. They are not making the kind of profits that would attract capital. I doubt that the emphasis that has been placed on damageability will deal with their problem.

Senator PEARSON. You place great emphasis on the continued consumer freedom of choice. Isn't that precisely the road we have been going?

MR. NEVIN. I will give you one example. I think that the role of consumer freedom of choice is one of the reasons why imported cars grew so rapidly in the United States in acceptance; the American consumer had the freedom to accept values in cars that had not been previously offered. It is certainly one of the reasons for Detroit's response to that kind of a market. Two years ago perhaps 5 percent of

our sales were in a car like the Maverick. Today we have got a Maverick, a Pinto, a Comet, and a Capri out there on the market, and roughly 25 percent of our sales in this model year have come from that kind of a car.

This area of consumer choice, I think there is a great difference in what damageability characteristics a consumer might want to pay for, depending on whether he lived in Detroit or Boston or Providence or Washington—high-insurance-cost areas—or lived in Cedar Rapids or an area where insurance costs were much lower. I think preserving that choice is important. I think if a consumer decides that he puts a higher value on fuel economy, on overall length of the car, even on aesthetics, so long as the Congress, so long as the committee takes action to make sure that the consumer has the information——

Senator PEARSON. Now, how do we do that?

Mr. NEVIN. Our recommendation here, sir, is that you proceed with just what is in S. 976, that you have the Secretary of Transportation do the study of relative damageability of cars. Now, we would hold out that we should not be asked to test our cars against those standards before we can sell them until you develop the relationship between the results of those tests and insurance premiums. But if the Secretary were to undertake the study that is incorporated in this legislation, S. 976, if he were to determine that there was a difference between the damage susceptibility of the right front fender——

Senator PEARSON. But how do I make that understandable to John and Mary Brown in Topeka, Kans.?

Mr. NEVIN. I think we may on occasion underestimate the American consumer. In fire insurance I would doubt there are very many consumers who are unaware of the fact that they pay less for fire insurance if they own a house in the city of Detroit where you have got a very sophisticated fire department and a lot of water than they pay if they are in the suburbs.

The consumer reaction to the cars we have introduced recently, the low-priced car, suggests that the consumer who wants fuel economy, who wants repairability seems to have some very informal but highly sophisticated ways of finding out who is doing what for him.

Senator PEARSON. I do not disagree with your point and I do not disagree that the Government has some responsibility. We are educating so many people on so many things today, that I wonder what the saturation point is or how effectively we are doing it.

I thank you, sir; and I thank you, Mr. Chairman.

May I say I had a note from our colleague, Senator Griffin, that he would be here—and the record shows, he is a member of this committee—but the minority leader is gone and he has to hold the floor.

Senator HART. I was momentarily distracted by the concept it is cheaper to get fire insurance if you live in the city of Detroit. That depends on where you live.

Mr. NEVIN. Yes, sir.

Senator HART. Admittedly it is a sobering figure that you show on a chart here. As I say, my impression from the Bureau of Labor Statistics' statement was that there was about a markup of about 100 percent wholesale to retail——

Mr. NEVIN. Let me accept that and use \$100 instead of \$162. I think we can correct the record later.

Senator HART. Then the increase to you—take the 1970 and 1971 table there, that shows a \$29 retail increase—

Mr. NEVIN. Twenty-nine dollars retail increase for safety and emission equipment; it is greater than that in total.

Senator HART. For purposes of the discussion without holding either of us to this BLS impression that we have, that would be \$14.50 wholesale.

Now, we move to the column where you get this estimated 1975 increase which is a cumulative thing that so disturbs you; that would be the estimated retail increase associated with the standards, safety and air, and if we are correct on the wholesale figure, we would reduce that by about half, and it is still very substantial.

Mr. NEVIN. No, sir; the \$223 figure is from the report of the Administrator of the EPA to the Congress, and that is described in that report as the addition to the purchase price—that is not including profit, et cetera—that is the addition to the purchase price. I think that \$223, my view is the consumer probably buys what is shown as \$162 which is closer to \$135 or \$140. The \$223 is constructed in a different manner. We commend the EPA for being so candid, because accomplishing these goals is one that will cost money. That is an EPA number; it is not our number, sir.

As a representative of Ford I commend the EPA for the candor with which it has been willing to discuss the fact that the accomplishment of these very urgent public objectives will involve effects on prices. I think that candor is desirable and I think the American public is going to be willing to pay, but far more willing to pay when it has been warned in advance and it buys in advance than it will be if somebody suggested that they are going to get all this for free.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Nevin, so that I can understand your argument that we do not mandate bumper standards, let me ask you again what your estimate, retail, for bumpers will be to meet the 5-mile per hour front and rear barrier crashes without sustaining damage?

Mr. NEVIN. Ford would estimate that 5 miles per hour front and rear will involve a price increase of about \$100.

Mr. SUTCLIFFE. Have you received any figures estimating component costs for that bumper capability?

Mr. NEVIN. No, I have not. But no design decisions are made without some pretty careful approximations of probable cost. The designers know what kinds of configurations they are going to use to accomplish the objective, and they have what you would have to describe at this point in time as estimates of what kinds of costs they will ultimately incur from suppliers in order to purchase the components that will be added to the car.

Mr. SUTCLIFFE. You think the \$75 range is appropriate for the manufacturers' cost for the bumper protection?

Mr. NEVIN. Well, I don't want to overqualify these figures. If it is a hundred dollars at retail, it would turn out to be about \$75 at wholesale, \$75 to \$85.

Mr. SUTCLIFFE. In your statement you say that the bill, S. 976, promises no offsetting reductions in insurance and repair costs for the American consumer.

From the diagnostic inspection provisions of the bill, the Department of Transportation has estimated a 0.7-cent-per-mile maintenance and operating cost reduction. That translated into the trillion miles driven by car owners in this country amounts to an annual savings of \$7 billion.

It has been estimated that the prevention of unnecessary or improperly done repairs would add another \$6 billion of annual savings. Savings resulting from detections of defects in used cars prior to their sale has not been ascertained, but would reflect an additional amount of savings.

In the insurance are the titling and motor vehicle registration provisions that have been estimated to save \$1 billion of the annual loss of \$1.5 billion. And conservative estimates for property damage premium reduction for bumpers, 20 percent, for example, of the \$8 billion annual premium would after a certain population figure amount to, conservatively, \$1 billion of savings.

Senator HART. I do not know what it is made of and I would hope that we can get for the record the elements that go into it. I continue to question it, because if you take, as one example of the relationship between the total price I pay when I buy a car to that element which is attributable to safety and emission removal, your Galaxie in 1970 sold for \$3,026 and the 1971 Galaxie sold for \$3,246. That is an increase of \$220. If this tabulation is correct only about \$30 of that \$220 increase was standard related.

What I would like to find out is, if it was only \$30 to \$220 between 1970 and 1971, what will it be in 1975 as between the \$450 to \$600?

Mr. NEVIN. Perhaps I can read off some numbers for you, Senator, because I have tried to represent these prices as being solely those associated with safety and pollution. The total price increase in cars in 1968 was \$139. Now, I show \$70 as being associated with safety and emission by the Bureau of Labor Statistics. There was another \$69 associated with other considerations. There was another \$58 increase in car prices in 1969. We show \$31, the difference between \$70 and \$101 in the tab. So there was \$27 more associated with other factors.

In 1970, the increase was \$107 in total, \$32 of which, the difference between \$101 and \$133 associated with emission and safety, and the big increase was in 1971. The total increase, the average American car went up about \$220, and that was \$29 for safety and emission, and \$199 in reaction to the inflation.

That price increase I believe in a Bureau of Labor Statistics press release was represented to be a 5.9-percent increase in the price of new cars. That is adjusted with the safety and pollution costs of the increase adjusted out. That is in a year in which the cost of living in other areas of the country went up by over 7 percent and it is in a year in which the automobile industry for the first time in 5 years took any consequential price action at all.

I think you are familiar with the history of the industry in terms of profits. In 1966 when we began this process, the Big Four automobile manufacturers in the United States were earning profits that represented 6.6 percent of sales. By 1970 profits as percent of sale were down to 2.6 percent. Automobile profits are very substantially below those of Dow Jones industrial companies, et cetera, and I think the record indicates that we have not succeeded or attempted, however you

wish to phrase it, in passing on our costs; if we had our profits would not have declined as they have. We are not earning profits as a percent of sales as good as those of the other companies in the Dow Jones, for example, and I personally see no great hope—I certify, and this is really in response to Senator Pastore's question, too, that faced with these financial problems, every effort is being made to cut costs in other areas, but I can see no great hope for absorbing these costs.

Mr. NEVIN. No, sir. The only collision premiums that are paid by the American society add up to \$2.7 billion. That is Best's Aggregates number on collision premiums and the only offer of reduction has been associated with collision premiums, not the total insurance costs.

Mr. SUTCLIFFE. I think this is an appropriate time to analyze the cost figures, because you are giving the figures on the basis of collision coverage.

My figure of \$1 billion was presented upon a reduction savings based upon premium cost for the property damage area as a whole, including liability insurance.

So, let me turn to your point about insurance cost savings and price differentials.

How are insurance rates set in this country?

Mr. NEVIN. I am simply not qualified to respond to that. They are certainly not set in response to changes in automobile design based upon the record.

Mr. SUTCLIFFE. Based upon the record.

Theoretically, does a company have a right to set its own price, or does it have to go to a State insurance regulatory authority?

Mr. NEVIN. It goes to State regulatory authorities, but those regulatory authorities vary widely in the amount of flexibility they will permit in the establishment of premiums.

Senator PASTORE. On that point, just so we can clear it up, it does depend on what the insurance company has to pay out in damages. I mean the more a car is damaged and the more they have to pay out, the higher the premium rate. The less the damage for any reason and the less they pay out, the premium comes down. That is fundamental isn't it, regardless of who sets it? I mean that is how you justify a rate before any utility board.

Mr. NEVIN. No, sir, I don't mean to quarrel with you, I am only expressing a point of view here, but in an industry where you have got 36 cents of every dollar being used to cover administrative costs, in an industry in which when they are appraising something like a 5-mile per hour bumper, they say 20 percent of the collision premium which would be less than 5 percent of the total premiums and premiums have been going up at a 10-percent per year rate, I really doubt whether what you are seeking to accomplish, which is a reduction of insurance rates, is going to be accomplished by changing automobile design.

Senator PASTORE. I am not justifying the administrative cost on the part of an insurance company, maybe that is subject to investigation too—as a matter of fact. I think we have tremendous concern in that area—but all I am saying is this, that the more that the insurance companies have to pay out for damages to automobiles that are insured by them, the higher the rate goes.

That is the argument they make when they go before a utility administrator. It might be well be that the chances are their administrative costs are too high in comparison with what their disbursements may be, but that is another problem.

But fundamentally, if we can get these cars in a position where the damage is less, won't we be in a better position from the public interest in arguing before any rate increase board that they are asking too much for the premium?

I am sorry for the interruption.

Mr. NEVIN. I would certainly not dispute the point. I would question the priorities, sir. If those rates are going up at a rate of close to 10 percent a year, if car redesign can't change the car population for 7 or 8 years, I do think I would put a higher priority on dealing with the problems within the industry.

I know the industry witnesses, the automobile insurance industry witnesses, have placed great emphasis on car design. I can't accept the idea that the American consumer is going to get his maximum benefits if you impose vast new damageability standards on the automobile industry at a time when you are asking the industry to meet safety and air pollution standards which I am sure you would judge to be higher priority and at a time when all the evidence available says that there will be no significant changes in automobile insurance premiums as a result of those changes in design. That seems to me to be established by the 5-year record under the Safety Act, where under all the promulgated standards we haven't had the first example of someone saying this is worth a reduction of the insurance premiums.

Senator PASTORE. That is an indictment of the insurance industry, but if we can promote a bumper which at the rate of 5 miles per hour doesn't cause the damage of \$450, and those are figures given to me by the staff—we have had instances in the record where an automobile going 5 miles an hour and it hits a solid barrier and the damage is \$450. I don't think you can get many cars to go 5 miles an hour today; they are geared up so high.

Now, if you can cause \$450 worth of damages going five miles an hour, just imagine what the damage would be to an automobile if you hit an object going 20 miles per hour. You are telling me if you can eliminate that damage that it won't affect the premiums? There is something wrong somewhere.

Mr. NEVIN. No, sir. I am telling you that the people who are establishing the premiums are saying if you eliminate that 5-mile an hour damage, they will reduce premiums by 4.7 percent. I wasn't representing what should happen, and I don't presume technical competence there. I was simply stating that one insurance company in all America has said it would reduce premiums as a result of that 5-mile an hour bumper. The others have overwhelmed America by their silence except when they talk about automobile design.

Senator PASTORE. We will get them here to talk to.

Mr. SUTCLIFFE. Mr. Nevin, you would agree, then, that an insurance company cannot unilaterally determine its rate reduction, that this is based upon a filing with the State insurance commissions?

Mr. NEVIN.

Mr. SUTCLIFFE. So the 20 percent was not necessarily a fixed figure for what premium reduction rates would be?

Mr. NEVIN. I would have no reason to challenge any statement you make on this subject, but I don't think it is appropriate for me to attempt to testify as to how the insurance industry sets its rates.

Mr. SUTCLIFFE. But it relates to the premises and assumptions you make in your testimony. Let me suggest that you look at your chart entitled "Indicated Effect of 5-Mile-Per-Hour Bumper on Automobile Insurance Costs."

Now the savings presented there seem to be predicated on two assumptions: One, that only a 20-percent rate reduction will be required by State insurance authorities, and that the present liability system for compensating auto accidents will be retained.

Are those two fair assumptions for the information on that chart?

Mr. NEVIN. Yes; but if I may, I would like to get out of the tone of "only." Twenty percent was offered by one company in this country, and no one else has followed them, and that company has said that for 5 miles per hour and 4 miles per hour it will give 10 instead of 20. That is the record to date.

The statement the insurance commissions won't force larger reductions, you are right, I can't assure you they won't. But I will ask you to look at the record of 5 years of standards under the Safety Act in which to my knowledge no insurance commissioner in any State has said why is it that now you have got a collapsible steering column the American public shouldn't get a lower liability premium charge or now that you have better door locks so people don't pop out of cars—and there is a great number of thought-out standards that have gone into automobiles—and I know, sir, of no evidence that that's been recognized in insurance premiums and all I'm urging is that the Congress establish that relationship before it imposes, on this industry, another set of testing and standards at a time when we're struggling to try and achieve what I judge to be enormously higher priorities in the areas of safety and air pollution relationship that that has had any effect on insurance premiums. And until you are certain you are going to get the kinds of savings you are promising the consumer, we would urge you not to impose that kind of new workload on us, that kind of new possible price increase. And I said "possible increase" on the American public, because the burden of what they are going to carry is going to be high enough. I hate to try to defend absolutes here. I am trying to defend a position with respect to priorities.

Mr. SUTCLIFFE. I am just trying to understand the picture you depict on this chart.

Where on this chart have you depicted the potential savings to the consumer who would not have to pay his \$100 deductible because his car wasn't damaged in a 5-mile-per-hour crash? Those savings are not reflected on this chart: is that correct?

Mr. NEVIN. No, in the last sentence of the testimony associated with that chart, I say:

If the consumer is to benefit from the new bumpers, very major gains would have to accrue to uninsured motorists or to persons incurring costs as a result of collision coverage deductibles.

I attempted to cover that point in the testimony.

Mr. SUTCLIFFE. Have you calculated what the premium reduction might be if property damage losses were paid on a first-party no-fault basis only?

Mr. NEVIN. No sir; I have not. I think that the major impact of that, and I suspect you do too, would be on the administrative cost as opposed to the damage payout to policyholders. I have not attempted to calculate it, and I wouldn't have the basis to calculate it. In order to have that information before the committee, which was the basis for that chart.

Mr. SUTCLIFFE. Let me present information which was given to the House Interstate and Foreign Commerce Committee by Prof. Samuel Loescher, of Indiana University, who estimated that premium reductions would be increased by a multiplier of three if a first-party compensation system were adopted.

He said:

The magnitude of specific differentials by model on a no-fault collision option would triple over current levels.

Now, applying that formula to your chart, this would mean that even a 20-percent reduction in collision premiums on a first-party basis would increase savings from \$540 million to \$1.6 billion.

Mr. NEVIN. But the other billion dollars you can get without the bumper.

Mr. SUTCLIFFE. This was a savings reflected on the basis of combining and rating a car owned by the individual. You know what car you are insuring, and, therefore, your premium reduction capability factors out at three times what it would be when you have to break out between your liability insurance and your collision premiums. In other words, he is combining the collision premium payout and the property damage payout to get a factor of three to indicate what the potential savings are under a first-party system as opposed to the present system, and that does not take into account the reduction in administrative cost because that is not factored into the premium benefit payout. That would come through other premium reductions reflected in the total \$8 billion assessment, premium assessment for property damage.

Mr. NEVIN. You have just lost me.

Mr. SUTCLIFFE. Let's assume that a change to a first-party system, as Professor Loescher has testified, produces a multiplier—

Mr. NEVIN. I am not qualified to comment on the professor's testimony. I haven't read it, and I am not familiar with the data he used. I have no reason to quarrel with you, but I would like to avoid questions on testimony that I have not had the opportunity to review, to read or to understand.

Senator HART. Maybe I could help counsel and the committee and you.

Mr. NEVIN. Thank you.

Senator HART. Maybe we could do an arithmetic problem here, making some assumptions, without accepting the assumptions. Let counsel state the savings that the professor testified would result and then apply them to the figures that you have presented here.

Mr. SUTCLIFFE. I simply wanted to point out that the chart in your statement may have a different result if you put the insurance on a first party basis according to the testimony of Professor Loescher.

In other words, if we are considering S. 945 and S. 976 simultaneously, we have to try to understand what impact changes in the compensation system might have upon the total savings resulting from property loss reduction standards.

Using that factor of 3, the savings from the total premium dollar collected comes up to 13 percent rather than the 4.5 percent.

Mr. NEVIN. No, sir; I just understood your conclusion. I do not disagree.

The reason why many people in this country have supported and many of the members of this committee have supported so-called no-fault insurance is the belief that that will substantially reduce the total premiums that the American public has to pay to get the same kind of coverage from automobile insurance, substantially reduce the total premium.

Now, if you presuppose—and let me pull a number out of the hat, because I don't claim competence here, I do support what you are trying to do in the no-fault area, in trying to find better solutions, but if you presuppose the American public is paying \$100 today for a given form of coverage and presuppose that that coverage could be made available to the public for \$80 under a no-fault system—I don't want to represent that is true, I am just using it as an example—then at that point any moneys that you put into the car to reduce damageability will have a lesser payout than they would have under today's system, not a greater payout, because the consumer would be paying less money in the future under that system to get the damage paid for than he is today, and, therefore, the payout, the possible payout to him in terms of reduced premiums associated purely with car design would be lower.

I would have to go back to that—I am not familiar with the testimony—but to the extent you reduce the basic cost, then clearly the percentage further reduction that can accrue as a result of car design is going to be reduced and the payout for any costs that go into the car to accomplish an improvement will be longer and economically less feasible.

Senator PASTORE. You predicated this on a savings of \$20 on no-fault. What if the savings is \$80 out of \$100.

Mr. NEVIN. Then it is that much harder, I think, Senator.

Senator PASTORE. For whom?

Mr. NEVIN. It is that much harder to justify any addition to the car's cost. Let's assume for the moment, you assume a design feature, let's take a 5-mile-an-hour bumper at \$100. If the consumer is paying \$122 for collision coverage today, a 20-percent savings may have an attractiveness to him, \$25 a year the first year, perhaps it declines to \$17 in the second or third year.

If the consumer is only paying \$60 for the same collision coverage, the hundred dollars payout isn't going to be nearly as attractive. Collision is really no-fault coverage as it is written today, because you get your car covered regardless of whether it was your fault or somebody else's, so the principal applies more to the property damage number than it does to collision insurance, because in effect collision coverage is no-fault today.

That is the portion of the policy that pays the damage to my car when I bang into someone else's and it is my fault.

Senator PASTORE. You see you have lost me now.

Mr. NEVIN. We are now together, sir.

Senator PASTORE. Let's go over this again.

You pay \$100 more for an automobile because you have this bumper that gives you protection against an accident, right?

Mr. NEVIN. Yes, sir.

Senator PASTORE. If today you are buying insurance, you are saying you are paying \$122 per year for premiums. Let's assume you cut that premium down in half, and you keep your car for 5 years, are you telling me that you are not saving money?

Mr. NEVIN. No, sir.

Senator PASTORE. That is the argument you are making?

Mr. NEVIN. No, sir.

May I ask you to turn to this chart in my statement.

Senator PASTORE. That is your chart. I don't care about the chart.

You see, you are predicating your presentation here today—I am not quarreling with you. I think after all you have a perfect right to state your case and you make a good case for the Ford Motor Co.

Our job here is for the consumer and our job here is for the general public. All we are saying is this, today under the construction of the front of the car and the makeup of the car, with the kind of a bumper that you are putting on it or without the bumper that you are not putting on it, the result is that at 5 miles an hour sometimes you create a damage of \$450.

We are either trying to cut that down or eliminate it by the construction of the bumper. You come here today and have said, "Gee, if you do that it is going to cost the consumer a hundred dollars." I cannot question that. You have priced the car and it is going to cost the consumer a hundred dollars.

All we are saying here is if we get this insurance industry in a proper context and we get ourselves under no-fault insurance where we can avoid all these astronomical administrative costs that you have pointed out here today, that we can make an appreciable discount in the premium that an individual has to pay, that over the years while he is running that automobile the savings on these premiums will more than pay him for the extra cost of \$100 when he bought your automobile.

That is all I am saying.

Do you dispute that?

Mr. NEVIN. I would dispute it with respect to some consumers, Senator. Without hypothesizing, let me give you two examples. The consumer in Washington, D.C., who owns a Galaxie and pays \$112 in collision insurance gets 20 percent and he starts off with \$25 a year, he gets \$18 in the second and third year, and \$16 in the fourth and fifth, I suspect would find the \$100 premium on the car attractive. I suspect he would be happy to pay it, would be glad to have it.

A man who is buying a Pinto, a lower-priced car, who lives in Cedar Rapids, Iowa, and who has a basic premium cost for collision coverage of \$48 as opposed to the \$122 for a larger Galaxie in Washington, D.C., who would only get a \$10 saving in the first year, \$7 in the second and third and \$6 in the fourth and fifth would be far less attracted to buying it, and I don't mean to confuse you, I am simply concerned that that kind of action—

Senator PASTORE. Yes; but if you have one fellow in Grand Rapids that you talk about and you have thousands in Washington, D.C., I mean where would you put your emphasis?

That is what we are dealing with here. We are dealing with the whole Nation.

Now, you can pick out exceptional cases. I know that. There is always an exception to the rule. There may be some localities where you may be right, but we are talking here about overall, in the long run. Wouldn't we be better off if it cost a little bit more to the consumer? After all, look, anything that Ford puts on an automobile, anything, whether it is a Federal regulation or the decision you have made, the consumer ultimately will have to pay for it.

The only thing we are trying to do here is to gage our priorities in such a way that the consumer once in his lifetime will come out the winner, and up to now he has always been the loser.

Mr. NEVIN. Senator, I am not—I guess one of the points I have not succeeded in making clearly, is I am not certain that the choice is between no 5-mile-an-hour bumpers and everyone must have them on every car in America. I am not sure that we wouldn't be better off if you had a system of rating in insurance—let's say that the 20 percent is valid, let's say that is what the consumer should get—then, I see no reason why an American consumer who says: "If I live in Cedar Rapids I don't live in New York, I don't have this risk, and therefore I don't want a 5-mile-an-hour bumper. I will buy a car that is a hundred dollars cheaper that doesn't have it," should be excluded from making that choice. We do not impose that decision on him with respect to men's wear. I can buy all kinds of shirts that have varying washability characteristics. The Federal Trade Commission or the Congress would certainly want to make sure that a maker did not suggest one shirt could be washed in the washing machine and the other has to be dryclean, if that wasn't true.

But to the extent that it is true it doesn't seem to me there is any great public interest served in saying to the man who is willing to pay to have his shirt drycleaned, or fire insurance on a house is a better example, than a man who wants to live in the country, even though premium rates are higher, that he cannot do that.

The insurance industry is doing that today. They put substantial surcharges on high performance engines for example that go into a car. I really do not see why you can't have consumer choice and the benefits you are seeking, sir.

Senator PASTORE. We did that with television sets not too long ago in order to promote UHF in the public interest. We required that as a matter of law all sets be all purpose. We might have to do this in automobiles, because the number of people who will benefit will greatly outweigh those people who might be in the exceptional cases.

And the Congress of the United States in meeting this problem will have to make that decision. I get the point that you are making, but the point still remains there is some substance to the arguments that we are making.

Mr. NEVIN. Yes, sir, and I hope you understand—

Senator PASTORE. If you were sitting up here rather than down there, you might be asking the same questions I am asking and you may be a little amazed at the answers that you are giving me.

Mr. NEVIN. I don't mean to—

Senator PASTORE. I don't mean to be impertinent at all, but you see your function is just a little different than ours. We are listening to

you, and you make some sense in some areas, and then in other areas your responsibility varies from ours. We have a different responsibility.

We are not trying to encroach upon the automobile industry. In fact, we think it is one of the greatest things that ever happened to this country. I think it is one of the finest things that has happened in the world. I am not here to deprecate the Ford Motor Co. It has given a lot of people a lot of jobs, it has fed a lot of families, but we are beset with the situation that today when you get a little bit of a dent in your car you have to go to the repair shop and take your house mortgage with you.

Mr. SUTCLIFFE. Mr. Nevin, you argue that the Federal Government not mandate bumper requirements because you think that the consumer choice in the marketplace will cause manufacturers to build bumpers with higher damageability protection characteristics.

At the same time you tell us that you are very suspicious about the way in which insurance premiums and the cost savings reflected in those insurance premiums will cause consumers to make choices in favor of cars with damageability protection.

Mr. NEVIN. I did not mean to use the word suspicious, if I did use it.

Mr. SUTCLIFFE. I am putting words in your mouth, then.

Your chart that you have shown us shows, according to you, that only \$24 price differential would be reflected under the present reparations system. Does it make sense to you, again going back to Professor Loescher's statement, that that \$24 figure would be multiplied by a factor of three under a first party reparations system, so now the consumer buying the car, the average consumer, would have an effective savings of \$72 a year rather than \$24?

Mr. NEVIN. If that was the proposition available to me, I would have been out of here by 10:15. If the proposition was \$100 of cost being added to the car and the consumer would get back \$60 or \$70 in the first year, I would want to sell that. I can't imagine anything that I would find easier to sell to the American public than that kind of a savings.

So, I don't quarrel with what view I would take if we could put a hundred dollars of cost into a car and save the consumer \$70 per year. There is no question as to what view the Ford Motor Co. would take on that kind of a proposition. We are not aware yet of a system that is going to produce that result.

Mr. SUTCLIFFE. But if there were a system that could produce that result—

Mr. NEVIN. If there were that kind of a system, I would endorse without qualification actions that added a hundred dollars of cost to a car and gave the consumer \$70 back the first year, without any qualification.

Mr. SUTCLIFFE. So, your argument of freedom of the marketplace is dependent upon the consumer having signals for cost differentials and those signals—

Mr. NEVIN. That is the first argument.

The second argument would be a little different. I really do not believe that there is any consequential public gain by saying to the consumer who puts a very high priority—let me take the most con-

troversial of all arguments, esthetics. He likes pretty cars with damageable bumpers. You create a system that says to this man the price of a pretty car with a damageable bumper is \$75 more a year forever in an insurance premium, and he says it is my \$8,000, I am using it to buy a Continental, I would love to pay \$75 a year more in insurance premiums and have that damageable car. I would not take this position in safety or air pollution. You must restrict consumer choice in those areas to accomplish worthy public objectives that are high priority.

I doubt that you must do that in the areas of damageability. Let me use a more specific example. Overseas producers who have volume in the United States but whose volume in the United States is not consequential as a percentage of their total volume, and I will exclude Volkswagen for the moment, because their volume in the United States is very consequential as a part of their total volume, but producers, and I don't have any information that causes me to use these names, but Jaguar, Mercedes, the makers of a variety of overseas automobiles, it's perfectly possible that one of those producers could say the tooling engineering cost of a 5-mile-an-hour bumper for the 10 percent of our cars that go into America just isn't worth it.

Now, I don't believe that the public interest is served by saying to the American public you cannot buy Jaguars any more or Mercedes any more because in our wisdom you ought to have a 5-mile-an-hour bumper. If they offer some benefit to the American public, that the American public finds to be greater than that insurance savings, then I honestly see no reason for the Congress to decide that it must take action to prevent the American public from making that choice.

Senator PASTORE. What a big difference that would make to the balance of payments.

Mr. SUTCLIFFE. Let me ask you then hypothetically what your feelings would be if through inattentiveness you happened to run into the back end of that particular car you were describing, the \$8,000 car, perhaps a fiber glass body no bumper protection, you'd purchase 5-mile-an-hour bumper protection for your car, you hit him at 7½ miles, your car is not damaged, his car has \$800 to \$1,000 worth of damage on it. As a result your company that you are insured with has to pay the liability premiums and your policy is canceled.

What would your position be in that situation?

Mr. NEVIN. Let me ask you to define which of the two insurance systems I am answering the question under. I was just answering the last question as if you had already passed no-fault. Have you passed no-fault when I'm asking this question or is it still a matter of serious public issue?

Mr. SUTCLIFFE. Let's answer the question both ways. Under the present liability system, what would your feeling be?

Mr. NEVIN. If you are going to keep a liability system that says that if I have no-fault I am entitled to collect from somebody else, then I would say that you have got to make sure that that system assures me that the guy who bangs into me is insured. That is one of the great failures of the system we have right now.

I may do what I think is prudent and insure myself against damage I do to somebody else, but if somebody bangs into me and hurts my wife and my children I may find out too late he was not insured. So,

I don't consider an insurance system to be acceptable, whether it is no-fault or tort liability, that says some significant number of people may take risks on the highway of hurting me and I may through the luck of the draw end up uncompensated by that loss.

So, if you presuppose now that I bought my Jaguar and it is my fault, you can have a deductible, the insurance companies could impose that we will pay no more than the first \$100 or the first \$200 on a Jaguar, but I don't think that that problem is large enough to say that you want to exclude large numbers of cars.

MR. SUTCLIFFE. Let's go to the second situation where you are under a first party no-fault benefit. If you, through your inattentiveness, had hit that damaged prone Jaguar—

MR. NEVIN. Under no-fault it's no problem, I have to agree with you. If it is no-fault and I have got to pay for any damage done to my car, then my insurance company says Mr. Nevin you bought a Jaguar, the Jaguar has miserable bumper systems and you are going to pay \$50 more for your premiums a year and we're going to insure you. Then I have no trouble. Anybody can bang into me, and I am responsible. I agree it's more complex if you don't go to no-fault. But not so complex that I'd say that nobody can buy a car that doesn't meet the standards or that I would say that was desirable if the Congress could find an alternative. I don't mean to be so positive.

MR. SUTCLIFFE. But under a no-fault situation, then, you would only be responsible for your own car, and if you chose to buy damage protection for your vehicle, you would have that damage protection reflected in lower premiums. If someone else chose not to, they would have higher premiums for that particular car.

MR. NEVIN. The ideal system would be one where I carried the full financial burden of my choice which was to buy a Jaguar.

SENATOR PASTORE. If I understand you correctly, you would not oppose this legislation if it could be shown to you that where a person has to pay \$100 more to buy a car because of the safety features he would be saving commensurately and even more on his insurance policy, and you put the case if they could show you that you could save \$60 or \$75 the first year, you would have no opposition to it at all; is that correct?

MR. NEVIN. No; I said I would want the opportunity to sell that because I would try and sell it. I don't think, Senator, I would take the next step which is to say that I would want to make sure that anyone who didn't find that \$70 saving attractive couldn't take the course of action in the market he wished to.

There are many parallels. We don't require the American public to use plastic dinnerware because Dresden china is highly breakable. If the public is informed, if the public knows what it is doing—and I fully support and have supported in this testimony efforts to provide information—then, unless the Congress concludes there is no other course of action available, I see really no reason to impose a limit of choices on the consumers of automobiles. You don't do it on housing. You can buy a house that is frame in the country and pay a big premium to cover it with fire insurance.

SENATOR PASTORE. How does the auto buyer know that? Do you mean the auto buyer would go to the dealer where he has that option and the dealer would say if you pay \$100 more to get these bumpers you

are going to save a bill of \$450 damage because this bumper will cause \$450 and this one wouldn't cause any at all?

Don't you think there is a responsibility on the Congress to protect the consumer without the consumer being always placed in the position of caveat emptor?

Mr. NEVIN. I think it is a matter of degree, Senator, and I would give you one example.

The insurance industry has in the last several years put substantial premiums on cars that were equipped with high performance engines, cars that had big engines relative to their weight. They actually set a standard in terms of power-to-weight ratio where an engine had a certain amount of power relative to the weight of the car and therefore a speed capability that the insurance industry thought was excessive.

You have never seen anything dry up faster in America than sales of that kind of car. That suggests to me that the American car buyer did understand if I buy this kind of engine in this kind of car I am going to take an insurance premium increase of some consequence, and I am not willing to do that and therefore I am not going to buy.

It also suggests to me that the guy who bought a car with that kind of an engine must have had the same knowledge and said for my use I want to do it.

Senator PASTORE. If it would work out that way, Mr. Nevin, you may be right, but we have had too many experiences where freedom of choice has actually added up to caveat emptor.

Mr. NEVIN. I hope you don't think I am urging that on you, sir. I am not.

Senator HART. Senator Griffin?

Senator GRIFFIN. No questions.

Senator HART. Would you for the record submit whatever comments you might want to make on the amendments that involve controlling the odometer and the vehicle to in-use pollution inspection features?

Mr. NEVIN. Yes; I would.<sup>1</sup>

Senator HART. I appreciate the directness with which you have commented on the other proposals. I only regret the conclusions that you have reached with respect to them.

We certainly appreciate the testimony that you have given. Thank you very much.

Mr. NEVIN. Thank you, sir.

Senator PASTORE. Thank you, Mr. Nevin.

Senator HART. Our next witness and one of the too few examples that people cite of individuals that can affect the enforcement of the system is Ralph Nader, whose influence on the automobile industry has been not as great as he would like but it has been significant nonetheless.

#### STATEMENT OF RALPH NADER, WASHINGTON, D.C.

Mr. NADER. Thank you. Mr. Chairman, distinguished members of the Senate Committee on Commerce, I am grateful for your invitation to comment on S. 976, the Motor Vehicle Information and Cost Savings Act, which is designed to put more product integrity into the automobile and stimulate competitive forces which even the collusive auto

<sup>1</sup> See p. 1391.

industry cannot completely ignore in its continuing quest for greater fraud at higher prices for more millions of Americans.

The burden of this proposed legislation dwarfs the feeble provisions which are to be its tools. That burden is trying to stop the yearly toll of billions of dollars and unnecessary hazards imposed on motorists due to the calculated design, construction, servicing, and repair costs of the automotive industries—all calculated to create a series of repercussive consumer demands for goods and services which arise out of the deficiencies of the original motor vehicle's design and construction in the first place. The automobile industry, coldly and with slide rule precision, has developed a product which, from bumper to tail light to engine, supports a parasitic aftermarket, a many-billion-dollar-a-year market, marked by enormous and monopolistic company mark-ups on replacement parts. The most visible exploitation, bumpers that are fragile and ornamental, illustrate the millions upon millions of dollars which the auto companies make by requiring motorists to buy portions of their cars twice or thrice.

I would like to at this point illustrate what I mean here. This is, of course, one of many possible illustrations. This is the photo of a Mercury Montego with the hood very vulnerable to damage as well as posing injury to anybody who might be struck by the front of the car. The cost of the hood according to current prices is \$94.25. The cost to repair that front after a 5-mile barrier crash is \$402.11. These I submit for the record.

Senator HART. They will be received.  
(The illustrations follow :)

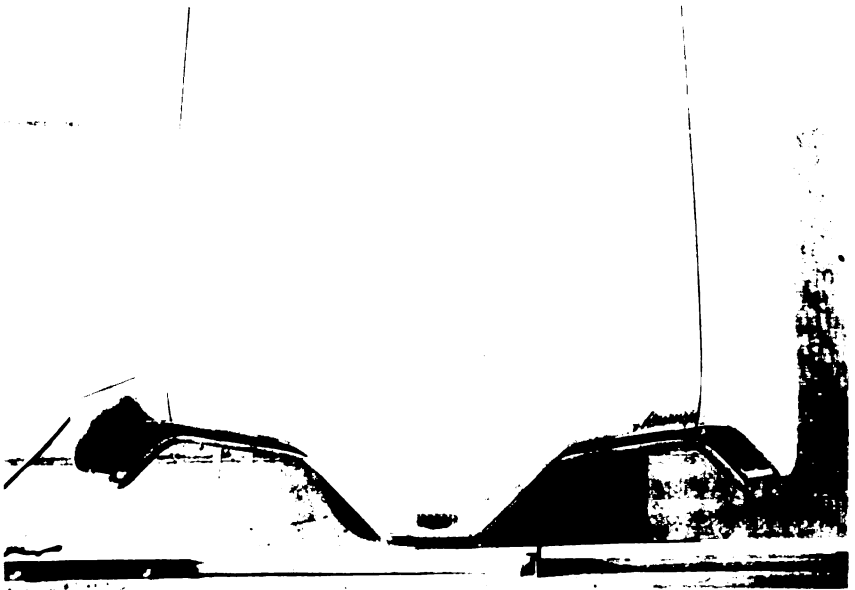

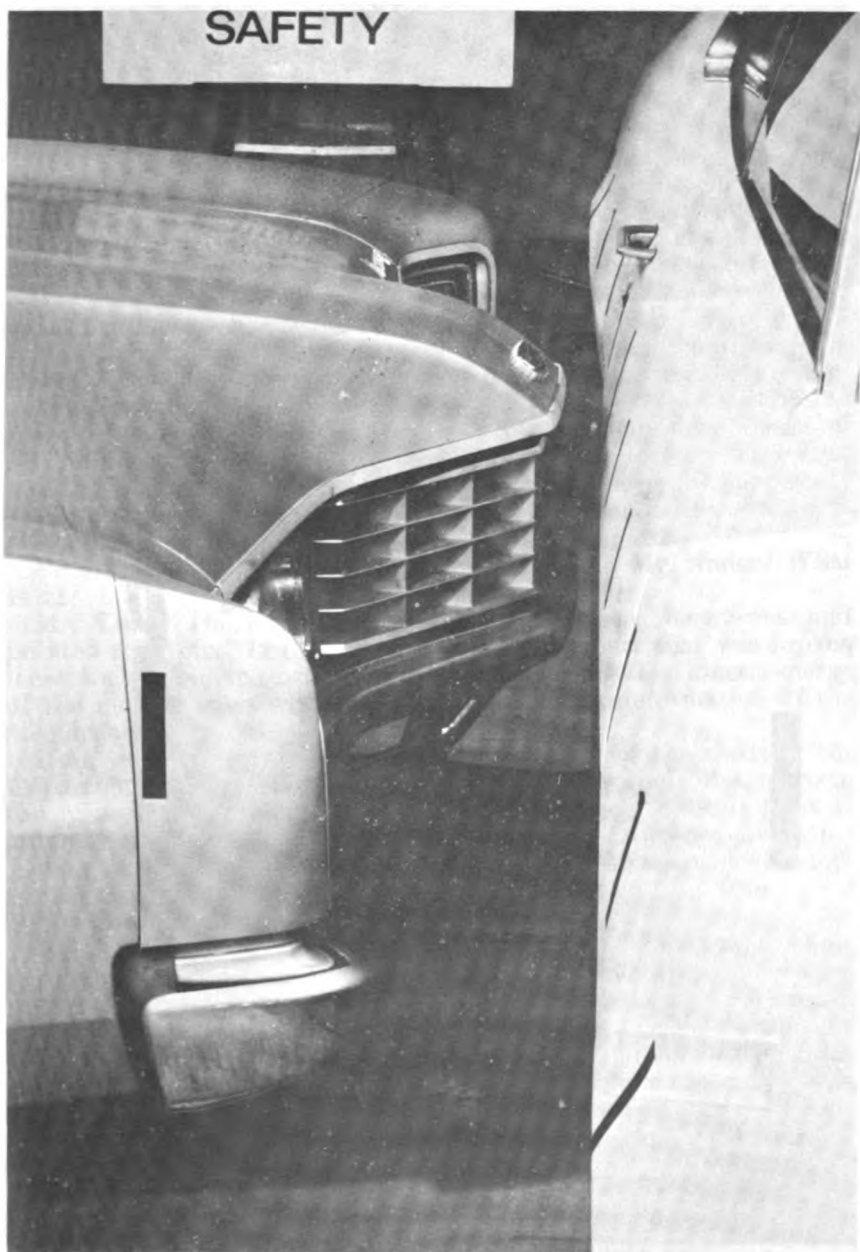

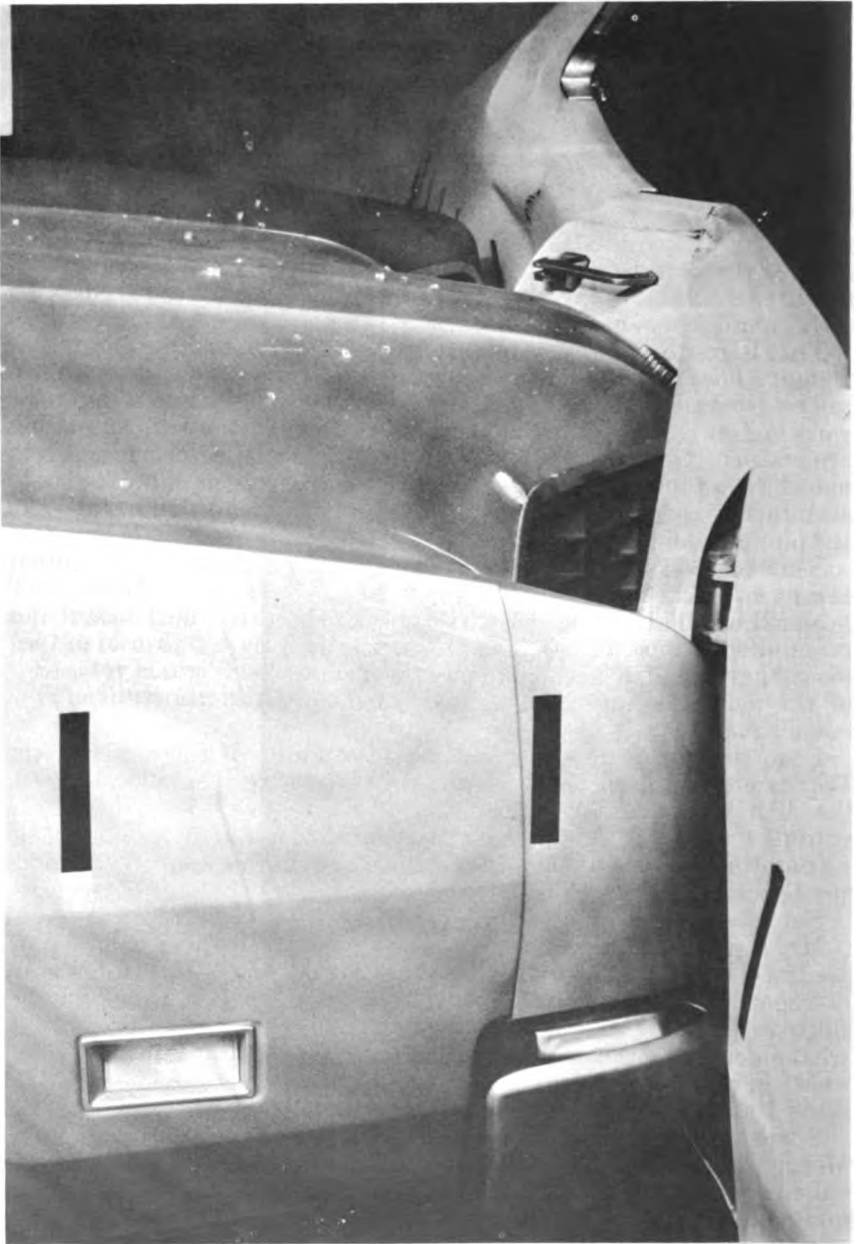

FIGURE 1.—Wedge-shaped design of 1971 Mercury Montego front end, believed capable of directing impacted pedestrians downward and under the car.

**FIGURE 2.**—“Battering ram” and pointed front end contour of 1971 Mercury Montego.

**FIGURE 3.**—Closeup of 1971 Mercury Montego front-to-side impact at 10 miles per hour with another 1971 Mercury Montego. Note fender extension “chopper” design cutting into side of impacted car.

**MR. NADER.** In addition, these fragile bumpers support a subindustry which sells us millions of dollars of bumper guards.

Also, I would like to interpose here the necessity for the committee to entertain alternative bumper design systems outside the auto industry, and there are many, and one I would like to just submit also later for the record comes from the Lawrence Radiation Laboratory where an emergency energy absorbing device was developed as a byproduct of a mission that the large radiation laboratory had to perform, covered by U.S. Patent No. 3,181,653 issued on May 4, 1965.<sup>1</sup> The device was further developed in 1960, and the inventor has assigned as he does under the law the patent rights to the U.S. Government through the AEC, available on a royalty-free basis, presumably.

This is just by way of illustrating that a patent search of our U.S. Patent Office by the Department of Transportation more systematically across the board might be able to find some of those individuals working on Government contracts who have come up with ideas that are eminently sensible and at least define the area of concern and at most have a fairly well-developed answer to the question, although only an industry can apply the capital necessary to bring the invention to the point of refined production.

**Senator PASTORE.** Can you describe that patent, Mr. Nader? What is it?

**Mr. NADER.** The device is an assembly of sheet steel membranes and pointed steel pins. If the pins are struck by a part that was broken loose, they would, in turn, puncture the membranes. The kinetic energy of the moving mass would be dissipated by the deformation of the membranes.

I am submitting this, Senator, as an example of the need for the Department of Transportation to begin searching their files, to go to the AEC, to go to NASA, to go to all these areas to see if there is spinoff technology for civilian use. Obviously, Lawrence Radiation Laboratory has one of the preeminent places in the scientific development area.

**Senator PASTORE.** I am familiar with it.

**Mr. NADER.** The importance of focusing on the bumper as it is now designed is that if the auto companies can so brazenly display such disregard for the consumer's pocketbook with bumpers which are for all to see and still try to justify them and still try to in effect circumvent what is obviously commonsense dealing with fraud, one can imagine what they will try to do once inside the vehicle where the visibility is much less and the components are more complexly interrelated.

I would also like at this point to illustrate the mentality of Ford Motor Co. I must say that in the last 5 years the industry has shown some progress. Five years ago they showed depravity. Now they show coherent depravity, judging by their statements, and the more they seem to change, the less there is actually any change.

Here is an advertisement in the April 30 *Washington Post* of this year where Ford displays their expenditure of millions of dollars over a national scope to try to convince an increasingly skeptical consumer that there is one auto company that even tries to listen. The section here deals with a statement "What you don't like about us."

The Ford ad quotes the following: "It isn't all roses, though"—that is rather gratuitous—"one third of our mail falls into the complaint

<sup>1</sup> See p. 1906.

category. People are mad about a lot of things, justifiable in many cases." Then they quote a letter from Mr. J. Highs, of Painesville, Ohio, as the following: "Why in the name of reason can't you people make practical, functional bumpers that will protect the car instead of adding to the damage that a collision of the most minor force causes?"

Ford concludes: "Ford Motor Co. isn't about to solve every gripe overnight."

This isn't a gripe that suddenly came to Ford Motor Co.'s attention, it is not a gripe that they have just been put on notice to solve overnight. It is a gripe that goes back at least years when bumpers lost all pretense of protection. It is a gripe that goes back to Mr. Henry Ford II's grandfather who certainly had better ideas as to how to build a functional bumper than his illustrious grandson. Yet this is the type of tripe that is fed to the American public where they can brazenly quote this type of complaint, forget about the past, forget about the billions of dollars lost and the profits unjustifiably made, and then say we are trying harder, we are listening for the future.

Senator Hart expressed one major impact on the consumer well on February 25, 1971:

American consumers spent \$25 billion to \$30 billion a year on auto repairs. Various studies on the quality of the work were presented to us. They rated the poor, unneeded, or not done work at amounts ranging from 36 to 99 percent. Even taking the low figure, that means consumers are wasting \$8 billion to \$10 billion that they lay out for auto repair work yearly.

The thrust of this bill is that a strategy of prevention concentrating on the disclosure of comparative susceptibility of automobile models to property damage and their crashworthiness, coupled with timely automated diagnosis through inspections, will save the consumer much money and improve safety. A sturdier, safer automobile reduces the likelihood of fraud and shoddy service in the repair, replacement and insurance markets. An ounce of prevention is worth a pound of cure.

Fragile bumpers which release between \$300 and \$400 worth of economic demand for 1971 models crashed at 5 miles per hour offer sizable opportunities for rapacious sellers. On the contrary, bumpers which protect cars at such speed levels or higher, would foreclose such opportunities.

Yet, without a recognition of the preconditions which permitted this pyramiding of costs—to the consumer—and sales profits to the industry, the proposed bill cannot be seen in its exceptionally modest context. These preconditions are:

1. An anticompetitive, collusive pattern of industry behavior, dominated by General Motors.

I will refer you to 11 recommendations by top staff of the Antitrust Division, economists and lawyers in the last 5 years, including former Assistant Attorney General Donald Turner recommending that there exists quite capable antitrust doctrine and economic reasons to break up General Motors and Ford to restructure a more competitive industry for better price, better quality, better innovation to the consumer—real consumer choice.

2. Criminal fraud or criminal negligence in the design of motor vehicles.

We don't think we can attribute any kind of motivations other than calculated criminal fraud to the auto companies who year after year

design these bumpers knowing full well the immense property damage and cost to the consumer and knowing full well that they have the available technology at virtually no cost to prevent such damage. It certainly can't be attributed to anything but knowing calculated criminal fraud.

3. Vast secrecy over facts and profits which the consumer has a right to know and obtain easily about vehicles, marketing practices and available, alternative ways of reducing costs and injuries.

4. The lack of any rule of law and enforcement dealing with this overworld crime backed by adequate inspection and enforcement resources.

I think if we judge the criterion for criminal intent, that is the knowing development of a condition which harms people, the knowing awareness of alternatives, and the profiting from the consequences of the harm, and the repetition of such behavior year after year after year, that fulfills the classic definitions of criminal fraud.

S. 976 clearly falls far short of treating these preconditions, although its pretensions are quite ambitious. The bill reflects the endemic weaknesses of political timidity to do much about the brazenness of corporate crime continually documented by studies and materials brought before this committee and the Senate Subcommittee on Anti-trust and Monopoly. If after being exposed to details about the auto industry's massive thievery, its massive contempt for both the consumer and the Congress, for the past 5 years—totaling many volumes of hearing record—if this is the best legislation your political antennae permit you to come up with, then it is respectfully suggested that some of you who are most concerned take some time out and begin to ponder, like Lucretius, on the nature of things \* \* \* relating to the corporate state of our times.

Even adopting the frame of reference of the bill's proponents—that a little is better than nothing—is this bill workable? Can a bill which tries to replace entrenched greed with more decent corporate behavior work without criminal sanctions for knowing and willful violations, without other civil sanctions initiated by government and aggrieved citizens, without explicit authorization levels to fund the programs described by the legislation? How many examples of deceptive packaging must this committee send to the Senate floor before it ceases grovelling before the Senate Committee on Appropriations with such boilerplate language as in section 503 of the bill—

Senator GRIFFIN. I wonder if I might interrupt the witness for a moment, Mr. Chairman?

Senator HART. Senator Griffin?

Senator GRIFFIN. I have listened with attention here as you have used a lot of very colorful language. I am sure it probably makes good press, Mr. Nader, and such terms as "calculated criminal fraud," "brazen corporate crime," and so on and so forth, but when you get down to the point where you are accusing this committee of "groveling before the Senate Committee on Appropriations," I rather resent that contemptuous language, and I just want to make sure that the record reflects it. This committee does not grovel. This committee in my humble opinion has done a very outstanding job regardless of what your opinions are, and while the automobile industry is by no means perfect and we have a lot of work to do, we could regulate it to death, and we are very close to doing that, in my opinion.

I think frankly that you don't need to use such language to get attention for your views. Your statements are going to be widely covered if you will stick to the facts. But that is only my advice, and if you want to use those kinds of adjectives and accuse people of such things, including the Members of Congress, I guess you can do so, but I hope and I would think it would make your testimony less effective.

Thank you, Mr. Chairman.

Mr. NADER. Senator Griffin, I am quite aware——

Senator HART. Let me just interject here.

I have steamed about what we ought to do about the Appropriations Committee, and I suppose if I were on it I would feel differently. I always think the authorization committees do probably know better what is required for a program, but when you stick the figure on, then you are told that the Appropriations Committee knows better what the total pot is.

Mr. NADER. That is my exact point.

Grovelling is defined in the dictionary as "an abject subservience." I do not believe we need——

Senator PASTORE. Would you leave the word "abject" out?

Mr. NADER. It is quite clear, Senator, if you need any more facts beyond what is permitted in the short testimony and time available, I would really refer you to Mr. Crandall and to the volumes of testimony that he and others can bring to your attention, with documented, calculated examples of gross criminal negligence at least, if not calculated fraud.

If you will let me finish the statement, I will give additional examples. But as far as the Appropriations Committee is concerned, I am asking this committee to stand up for its rights. What committee knows better after having all these hearings how much money is needed and at least to suggest with a documented case to the Appropriations Committee how much money is needed?

There is case after case after case that can be cited, and I refer to some in a moment, where the Appropriations Committee in fact takes the Senate Commerce Committee's legislative concern which passed the Congress and emasculates it totally, and one of the reasons is that it receives no clear-cut mandate or no clear-cut communication with adequate, detailed studies from the legislative committee.

I would submit that this has happened so frequently that it betrays the feeling by nonappropriation committees that this awesome Appropriations Committee cannot be advised, cannot be given in detail the facts to help it make up its mind more explicitly.

Look at the bill, "There are authorized to be appropriated to the Department of Transportation such sums as may be necessary to carry out the provisions of this act."

It gives absolutely no guidance to the appropriations committees who do not hear the facts, who do not get the feeling such as being expressed here this morning, who aren't exposed to the testimony, and who even if they had good intentions are going to give this a much lower priority than would the legislative committee.

Senator PASTORE. Mr. Nader, you are saying something that it is a little bit beyond your competence. I think you have done a marvelous job in alerting this country and this Congress to consumer rights, and many times you have been rather enthusiastic and we applaud you for

that. I think had you not come on the scene, maybe the picture would not be as healthy as it is today, as much as it might still be sick. But the fact still remains that a member of that Appropriations Committee is the chairman of this committee, Mr. Magnuson. I am also a member of that committee.

We have a tremendous amount of interest and compassion for the legislation of which you now speak. But now after all, the coffers of this country receive a number of dollars. This year we will have an actual budget that will run about \$30 billion short of the amount of money that we receive. If we appropriated all the money that is required by the Committee on Health, Education, and Welfare alone, we would have to double the taxes in this country.

Now, we have to consider everything.

The FCC comes before our committee, and they have many deficiencies there and they need more staff. The SEC comes before our committee and they have a tremendous responsibility. The Federal Power Commission—all these come before the Appropriations Committee.

Now, it is like the father of a family—I don't know if you are married and have a family—it is like the father of a family who brings a paycheck home. There are a lot of things he would like to do, a lot of things he needs to do, but he has to confine his activity within his pocketbook.

There is no deliberate intent to deny relief in this respect, but it is a question of allocating the priorities. It isn't a question of cases being presented. The case is presented, it is understood. Any Member of the Senate has the perfect right to introduce an amendment if he is dissatisfied with the amount that is recommended by the Appropriations Committee, and, then, of course, it is up for debate.

But these problems are not as simple as a question of carrying out every thought and every mandate of every legislative committee.

I don't mean to lecture here. All I am trying to tell you is you have got just as much heart on this side as there is heart on your side. You have just as much interest here. I am just as much interested in the consumer as you may be.

Mr. NADER. That is my point, Senator. My point is the Appropriations Committee needs detailed guidance from the legislative committee.

Senator PASTORE. No, we need more money, and there is only one way of getting it.

Mr. NADER. Suppose they ask how do we know how much to spend for this bill, shouldn't they have from your committee, this committee—

Senator PASTORE. It is being done, sir. They don't get everything they ask for because when you begin to cut up the pie, you have to take care of health, you have to take care of education, you have to take care of poverty, you have to take care of every other facet within our society that is crying out for help. It isn't only for the automobiles. It is everybody.

Yes, we do fall short in appropriations as against the authorizations, but it is a natural phenomenon, and there is only one way to cure it. Every mayor wants more money because he wants to get rid of the ghettos. What is more important, getting rid of the ghettos or

putting a bumper on an automobile? We have to decide that. Is it more important keeping a child in school, giving him a little education before he goes to school on the Headstart program or is it more important to put a bumper on a car?

All these things naturally have to be considered. So when you sit there and you give a general indictment that the Appropriations Committee is not listening, then I think myself you are doing a disservice to yourself, too, because that isn't the question at all.

You are privileged to come before our committee at any time you want, and if you feel that any legislative committee is derelict in presenting its case, you have a perfect right to come there. But I repeat again it is a question of allocating priorities, and we have got a big headache.

Mr. NADER. I couldn't agree more, Senator. All I am pleading for, because there has to be a contention between the dollar budgets, between the various programs, all I am pleading is that the Senate legislative committee on a bill be more specific in providing a justification for whatever level it thinks it warrants. The Appropriations Committee will undoubtedly slash it, but at least the Appropriations Committee will have something to go on.

Suppose I ask to testify before the Senate Appropriations Committee on one of your laws and urge them to appropriate a certain amount and they say to me, "We haven't heard from the Senate Commerce Committee about how much money should be appropriated in this bill." Where does that leave any citizen?

Senator PASTORE. They haven't said that.

Mr. NADER. The point is they haven't.

Senator PASTORE. No; we have witnesses coming before the Appropriations Committee. The legislative committees are being heard, and they are being heard on the floor of the Senate if we do not do the right job. I repeat again it is a question of money, and that is the eternal dilemma, more money.

Mr. NADER. Look at the utter failure of the Oil and Gas Pipeline Safety Acts and the Radiation Control Act and observe their miniscule appropriations—a caricature of recognition of your deliberations by your fellow Appropriations Committee. When is this committee going to fight for adequate funding support for its consumer protection bills by taking the first step of stating at least an explicit authorization level with backup detail?

When is this committee going to stand up to Lloyd Cutler and his industry cohorts and say that if there are criminal penalties for the poor and deprived, if there are criminal penalties for other industry and labor practices, then there must be criminal penalties for the automobile industry when its executives knowingly violate standards designed to protect citizens from injuries and systematic fraud?

For example, I think the Gas Pipeline Safety Act had an initial year's budget of something like \$250,000. This is for about 500,000 miles of gas pipeline, to set the standards and make sure they are enforced.

Let me go on to several other weaknesses in the bill which call for a complete redrafting in my opinion.

(1) Section 125(d) as written appears to ignore recent history by having the Secretary of Transportation undertake a feasibility study

relating to a crashworthiness index, and if by July 1, 1972, he finds it feasible, he is to develop and prescribe by regulations "issued as soon as may be practicable such a system of tests and testing procedures." In the first place, if the committee doesn't stipulate a date, "as soon as may be practicable" could trespass on eternity. Even when the committee stipulated a date, as for the used car standards—due by September 1968 and still not issued—in the 1966 National Traffic and Motor Vehicle Safety Act, the Department will violate its own statute. But the Congress has no control whatsoever over "agency discretion," as that term is charitably used unless there is a specific date for such regulations. Even more to the point, the Department has already recognized the feasibility of such a crash-injury rating system. Crash-injury specialists have long known such a system to be feasible.

In testimony by the Department of Transportation itself before this committee on April 14 and 15, 1969, the National Highway Safety Bureau's "Comparative Crash Survivability" program was described in some detail. (See pp. 93–100 of the hearings.)<sup>1</sup> A memorandum from the Department of Transportation stated:

Informing the consumer of the comparative crash survivability of all vehicles on the market is an indisputably important aspect of assisting him to make an informed choice in the marketplace, a provision clearly mandated in the legislative history and embodied in the substance of the law.

The Bureau accordingly has launched a program aimed at assessing the comparative crash survivability of all vehicles.

At the hearings the Department of Transportation, per Frank Turner and Robert Brenner, said the plan would be delayed by 2 months during which the Safety Bureau would obtain its own anthropometric dummies and develop a more sophisticated procedure for testing.

On June 26, 1969, Senator Hartke wrote to Frank Turner, Administrator of the Federal Highway Administration—at that time the overlord of the highway safety and motor vehicle safety programs—to request a status report on the comparative crash survivability program and particularly the projected date for completion of the crash survivability index. Some 5 months later, on November 18, 1969, Mr. Turner responded to Senator Hartke.

I would like to submit that letter for the record.

Senator HART. It will be received.

(The letters follow:)

U.S. DEPARTMENT OF TRANSPORTATION,  
FEDERAL HIGHWAY ADMINISTRATION,  
*Washington, D.C., November 18, 1969.*

HON. VANCE HARTKE,  
U.S. Senate,  
Washington, D.C.

DEAR SENATOR HARTKE: I am writing in response to your inquiry about the resumption of vehicle to vehicle crash testing and the current status of the Department's Comparative Crash Survivability (CCS) Program.

In answer to the specific questions you raised, we have completed the initial program planning work for the projected six-year program and the following is in progress:

1. Within 30 months we should be able to publish quantitative ratings of the survivability characteristics of vehicles by weight class based on analysis of accident data with limited crash testing.

<sup>1</sup> See Senate Commerce Committee hearings record, Serial No. 91–17.

2. At the end of FY 1975, we will be able to augment the first vehicle rating schedules by rank ordering the automobile population by make and model according to quantitative measures of their overall crash survivability characteristics. This will be based on not only statistical but also on significant crash testing experience.

3. We have arranged to resume vehicle to vehicle crash testing in December 1969. In addition, make and model measurements will be obtained from crash tests conducted for other Safety Bureau purposes.

4. We have procured anthropometric test dummies suitable for dynamic testing. Delivery of the last of the three test dummies on order in April was taken July 18, 1969.

As I have mentioned previously, carefully selected and controlled crash tests will provide useful inputs to the development of a meaningful comparative crash survivability index. However, to obtain a meaningful comparative crash survivability index it is essential that we do much more than just crash test automobiles. Such data alone cannot provide all of the information which will be needed. For this reason we will be combining and integrating the crash test information with the following:

1. Analysis of mass accident data.

2. Mathematical modeling and computer simulation techniques.

3. Utilization of multidisciplinary in-depth accident investigation team reports.

In order to get the maximum benefit from the various vehicle crash tests conducted by the Safety Bureau, each test will be programmed to obtain as much data as possible. At the present time it is our intention to conduct crash tests in fiscal year 1970 to obtain performance data on passive occupant restraint systems, integrated seats, and energy absorbing bumpers, and we will, as in the past, conduct compliance crash tests for those motor vehicle safety standards which require them. On each of these various tests we will be piggybacking requirements for the other program areas for maximum utilization of this activity.

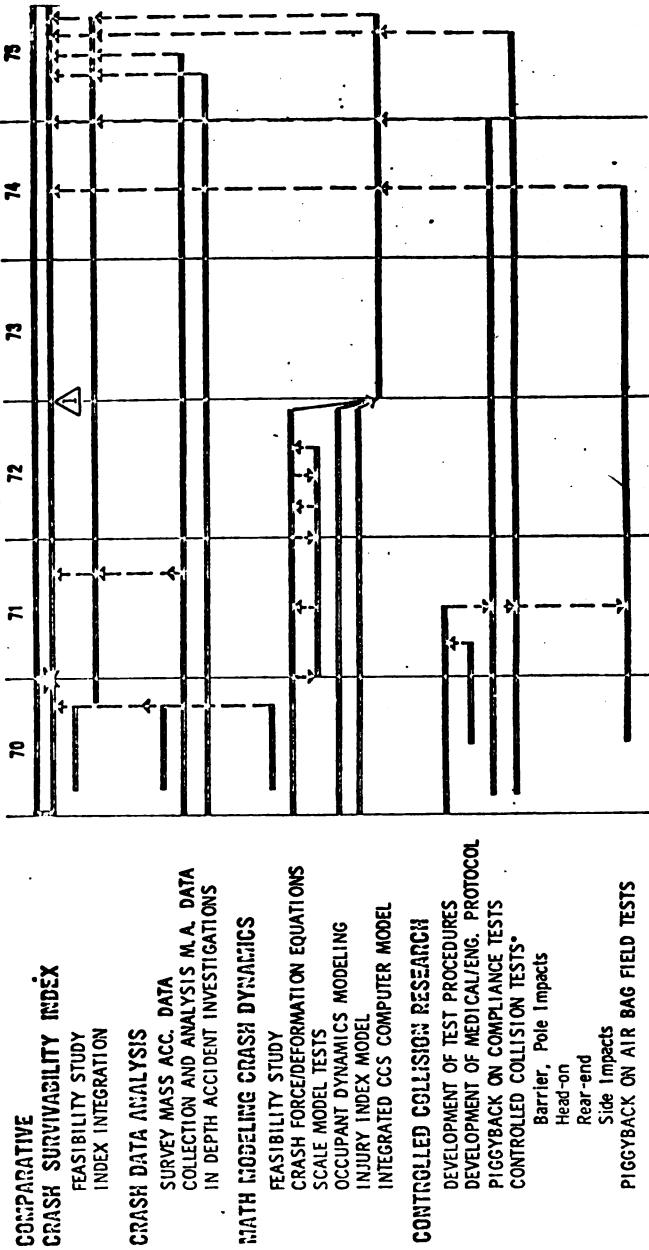

However, I would like to stress that we are broaching the state-of-the-art in the CCS Program; heretofore, no one has ever attempted to obtain a quantitative measure of a whole vehicle's crash survivability characteristics. Thus, the program plan represents our best estimate of how and when we may develop a meaningful comparative crash survivability index. While we are very optimistic over what can be done, our rate of progress will depend on the resources made available for this job.

I trust that this information is responsive to your request. If you would like additional information I will be happy to supply it.

Sincerely,

FRANK C. TURNER.

# COMPARATIVE CRASH SURVIVABILITY PROGRAM SCHEDULE

\*With Medical/Engineering Team Evaluations and Recommendations

\*Program Direction Decision

△ Comparative Crash Survivability Ratings by Vehicle Weight Cla  
△ Comparative Crash Survivability Ratings by Make & Model.

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
Washington, D.C., June 26, 1969.

FRANCIS C. TURNER,  
Administrator, Federal Highway Administration, Department of Transportation,  
Washington, D.C.

DEAR MR. TURNER: As you may recall, at our recent hearings to review the implementation of the National Traffic and Motor Vehicle Safety Act, we discussed in some detail the Highway Safety Bureau's program to crash test various motor vehicles in order to develop a comparative crash survivability index, by make and model, of all automobiles sold in the United States. At that time you indicated to me that the Bureau's crash testing would be delayed for approximately two months while the Bureau obtained its own anthropometric dummies and developed a more sophisticated procedure for the testing of these cars. You indicated that the dummies would be available in approximately 60 to 90 days and that testing would then resume almost immediately.

Since two months have now passed since you described these plans to the Committee, I appreciate receiving some information on the current status of the crash survivability program. Has the Department yet obtained the necessary test dummies? If so, when were these dummies received, and if not, when do you expect them to arrive? Has the Department completed the formulation of its new test procedure which you indicated would speed up the testing of various motor vehicles and accelerate the accumulation of meaningful data which could be made available to consumers? If so, would you please send me an outline of the proposed test program, and if not, could you explain when such a program will be available? Finally, can you indicate the projected date when the Department initially expects to have available a complete crash survivability index?

I believe that it is extremely important for information about the comparative safety of various types of motor vehicles to be made available to all consumers who are considering purchasing a new car. The Department's crash survivability program will be essential in developing this information in a form which will be intelligible to prospective car buyers, so I hope that your commitment to this project is as great as you indicated when you testified before the Committee on April 14th.

Sincerely,

VANCE HARTKE, *U.S. Senator.*

NATIONAL HIGHWAY SAFETY BUREAU, FEDERAL HIGHWAY ADMINISTRATION,  
U.S. DEPARTMENT OF TRANSPORTATION

COMPARATIVE CRASH SURVIVABILITY OF MOTOR VEHICLES

ABSTRACT

This report describes a program of the National Highway Safety Bureau to assess the comparative crash survivability of motor vehicles and to inform the public accordingly.

*Part I.*—Describes the concept of comparative crash survivability, the method and scope of the Bureau's program in this area.

*Part II.*—Describes the proposed general program.

*Part III.*—Describes in brief the preliminary phase of the program dealing with tests on the SUBARU, KING MIDGET and VW vehicles.

*Part IV.*—Presents the overall program schedule and funding requirements.

PART I.—INTRODUCTION

1. Background

The overriding purpose of a motor vehicle and highway safety program is to reduce the number of traffic deaths and injuries. This can be accomplished by either: (a) reducing the likelihood that crashes take place, (b) increasing the survivability of crashes that do occur, (c) increasing the chances of ultimate full recovery of victims from injuries they suffer in crashes.

This report deals solely with the crash survivability aspects of this comprehensive approach, more specifically, with a program for determining the crash survivability inherent in the design and construction of the vehicle itself. It is

important to bear in mind that the concept of rating vehicles according to some measure of their overall crash survivability is new. The development of a meaningful crash survivability rating system will be a difficult, complex undertaking, requiring a considerable investment in manpower, funds and time.

The historical antecedent of this program is in research started in the late 1930's due to DeHaven,<sup>1</sup> which established that many motor vehicle crashes would be survivable—even at high impact speeds. This has now been amply demonstrated in operating experience and in widespread reports on the effectiveness in crashes of seat and shoulder belts, of the energy-absorbing steering assembly, and of the HPR (high penetration resistant) windshield. All of these items are now Federal requirements. (See Figures 1, 2, and 3.) A number of other crash survivability aspects of the vehicle are covered in Federal standards now in effect or in rulemaking actions which are now in progress. Thus, vehicle design for crash survivability has become a very important dimension of automotive engineering practice.

## 2. Comparative crash survivability

The Federal motor vehicle safety standards for crash injury reduction and post-crash protection have been established for vehicle performance under standardized test conditions that produce comparable impact forces to those produced in actual crashes on the relevant vehicle components, such as the loads produced on the driver's chest by striking the steering wheel, or the front passenger's head striking the windshield or instrument panel. The consumer can thus be assured of the survivability of the degree that crash survivability is embodied in the standards in effect for the vehicle in which he is riding.

However, he also must know something about the crash survivability of the complete vehicle. Although he knows that all new vehicles (aside from the exempted classes) must meet minimum safety performance standards he does not know how much additional safety he is buying in larger and presumably higher priced vehicles, or, conversely, how much additional hazard, if any, he is incurring in purchasing smaller vehicles. Informing the consumer of the comparative crash survivability of all vehicles on the market is an indisputably important aspect of assisting him to make an informed choice in the marketplace, a provision clearly mandated in the legislative history and embodied in the substance of the law.

The Bureau accordingly has launched a program aimed at assessing the comparative crash survivability of all vehicles. The program has been started with the small cars which are exempt from the existing Federal crash survivability standards and hence which do not provide even this degree of assurance to the consumer. The fact that this program of vital interest to consumers has been started with small cars can readily lead to the erroneous conclusion that the intent of the Bureau is somehow to rule small cars off the road. *This is not a Bureau goal*, although elementary physics amply demonstrates that the smaller car can never have the equivalent crash survivability of the larger car, all other factors being the same. *Instead the goal is to inform the consumer on comparative or incremental crash survivability with size and price among all vehicle types*, starting with those as yet exempt from Federal safety standards and posing the greatest risk, and continuing with those that already are under Federal safety regulations.

## 3. Methods

The methods being followed in the Comparative Crash Survivability Program are largely those developed and perfected by Mathewson and Severy, et al.<sup>2</sup> Instrumented vehicles are caused to crash into each other. Engineers assess the resulting frame and body damage to the vehicle; physicians deduce crash survivability from impact force measurements and visual examination of damage to anthropometric dummies in the crashing vehicles.

A major effort will be made to develop mathematical models that will enable one to simulate crashes. However, the present state of the art in mathematical modeling of crash dynamics demands that a study be initiated to determine the practical feasibility of this approach. Once the analytical methods have been developed and verified, computer "crashes" will be substituted for actual crashes to the maximum extent possible.

<sup>2</sup> Mathewson, J. H. and Severy, D. M., "Automobile Barrier Impacts," Highway Research Board, National Academy of Sciences, Washington, D.C., Bulletin 91, Jan. 1954.

#### 4. *Scope*

The program ultimately is to cover all sizes and types of vehicles, angles of impact, rollovers and other crash conditions.

Because of resource limitations it will not be possible to crash test all make-model combinations, thus the order of tests will be set largely by the comparative frequency of death and injury totals associated with different classes of vehicles. The vehicles with the greatest involvement of crash death and injury totals will come first.

#### 5. *Correlated Programs*

Results of the comparative crash survivability program will be examined for possible correlations with data now being collected by the Bureau of nationwide crash death and injury totals by vehicle make and model, with the medical-engineering research investigations of accidents now being conducted under NHTSB sponsorship by seven different universities, and ultimately in relation to a new program shortly to be started on vehicle frame deformation under crash impacts.

### PART II.—THE GENERAL PROGRAM

The purpose of the Comparative Crash Survivability program is to develop the scientifically reproducible methodology that will enable the NHTSB to rank order motor vehicles in terms of their comparative crash survivability characteristics. The methodology consists of utilizing the results of statistical studies of vehicle accident experience by make-model and integrating it with data from controlled collision research, vehicle frame deformation analysis and in-depth accident investigations by medical/engineering teams, to arrive at a vehicle crash survivability rating.

#### 1. *Vehicle Crash Survivability Rating*

The Federal standards provide quantitative criteria for important separate properties of a vehicle that bear on its crash survivability. For example, Standard Nos. 203 and 204 identify the required performance values for the energy-absorbing steering shaft; Standard Nos. 208 and 209 cover the performance of safety belts, etc. However, there is no standard that covers crash survivability of the vehicle. Furthermore, even if a standard were to be issued for such an all-inclusive property as "crash survivability," it would be a minimum standard that, while giving the consumer at least this degree of assurance, would not aid him in selection among alternative competing models—all of which would have to meet the minimum standard.

The purpose of the projected vehicle crash survivability rating is to establish a means for evaluating the crash survivability of a vehicle and, in some manner, rank ordering its performance in this respect with that of other vehicles. By referring to the rating scheme the consumer could become informed of how much additional "crash survivability" (if any) he would receive by purchasing one vehicle instead of another, for example, a large vehicle instead of a "mini-car."

At the present time, there is no generally accepted analytical or other scheme for rating the crash survivability of a vehicle, although at least two groups of investigators have developed their own schemes.<sup>3</sup> Two methods are now under study for development by the Bureau. In the first method, crash survivability ratings would be derived from detailed statistical analysis of State accident data on a vehicle make-model basis. The second method involves more extensive research and centers on utilizing the techniques of medical-engineering investigations of crashes, vehicle frame deformation analysis, and controlled research collisions to arrive at comparative ratings.

The statistical and medical-engineering methods of arriving at comparative vehicle ratings should, in principle at least, converge on the same results. However, it appears that the statistical approach can produce results sooner than the medical-engineering method. On the other hand, the medical-engineering work should ultimately produce more reliable ratings along with substantially broader and deeper understanding of the problem. Accordingly, both methods should be pursued in parallel, with the results produced by each being reconciled with the other as they progress.

<sup>3</sup> Dr. Nahum, UCLA and Cornell Aeronautical Laboratories.

An illustration, a straightforward system of A, B, C, and D ratings might be developed, with the criteria being as simple as follows:

**Vehicle crash  
survivability  
rating**

**Criteria**

A-----	Greater than 90 percent chance of surviving a crash.
B-----	75 percent to 90 percent chance of surviving a crash.
C-----	50 percent to 75 percent chance of surviving a crash.
D-----	Less than 50 percent chance of surviving a crash.

Since crash survivability is dependent upon impact speed (and, of course, whether the occupant was wearing a proper safety belt at the instant of impact) the survivability rating undoubtedly would change over the range of impact speeds. For example, a vehicle with excellent survivability in a low speed crash would be expected to have decreasing survivability in crashes at higher speeds up to speeds at which no impact is survivable.

In this type of a crash survivability rating scheme, the data derived from extensive computer analysis, laboratory tests, field tests, and correlation with medical-engineering investigations of accidents could be organized in easy to understand tables such as Table 1. In this example, vehicle #1 has comparatively excellent crash survivability at impact speeds below 40 mph, good survivability in 40-50 mph ranges, and adequate rating between 50-60 mph, and a poor rating at greater than 60 mph impacts. In contrast, vehicle #4 has an adequate rating only for impacts under 20 mph. At greater speeds, its survivability is poor.

## 2. Statistical Rating of Vehicle Crash Experience

About 14 million injury-producing vehicle accidents occur each year in the United States. These accidents can be classified according to the involvement of vehicles of different make-model-year combinations. When the accident data are thus classified and related to the numbers of registered vehicles in the comparable classifications, it becomes possible to derive a comparison of vehicle accident rates. This approach has a number of broad-gauged benefits, and is being implemented by the Bureau by helping states to upgrade their data systems under the provisions of the Highway Safety Act.

However, the approach has several inherent limitations which preclude other than very broad interpretations. For example, if the data indicate that one particular type of vehicle is involved in a disproportionately high number of fatal crashes, it usually cannot be determined except with more detailed statistical analysis whether this is related to the vehicle, the class of drivers that use that class of vehicles, or some combination.

An even greater degree of complexity in interpretation relates to the nature of the driving exposure of the high-accident vehicles in comparison to that of the others. Clearly, if vehicles are used under inherently dangerous conditions, more accidents would be expected.

## 3. Medical-Engineering analysis of vehicle crash survivability

The medical-engineering method of assessing the comparative crash survivability of vehicles is comprised of several major subprograms each of which has its own unique purposes in addition to sharing the common purpose related to crash survivability: (a) Vehicle Frame Deformation Analysis, (b) Medical-Engineering Accident Investigations, and (c) Controlled Research Collisions.

TABLE 1.—POSSIBLE SCHEME FOR RATING VEHICLE COMPARATIVE CRASH SURVIVABILITY

[Crash survivability rates: A—90 percent chance of survivability; B—75 to 90 percent; C—50 to 75 percent; D—less than 50 percent chance of survivability.]

	Speed at impact—					
	Under 20 miles per hour	20 to 30 miles per hour	30 to 40 miles per hour	40 to 50 miles per hour	50 to 60 miles per hour	Above 60 miles per hour
Vehicle Number 1.....	A	A	A	B	C	D
Vehicle Number 2.....	A	A	B	C	C	D
Vehicle Number 3.....	B	B	C	C	D	D
Vehicle Number 4.....	C	D	D	D	D	D

One of the basic requirements for the success of the comparative crash survivability rating system is to be able to correlate the personal injury aftermath of the actual highway crash (in which the actual crash forces and impact speeds are not known with any degree of reliability) to the highly precise information obtained in the controlled research collision.

For the medical-engineering analysis of vehicle crash survivability, the Bureau would rely substantially on the judgment of its medical-engineering teams from universities throughout the country, similarly qualified experts from industry, and its own in-house staff. These and other participating scientists would be invited to witness controlled collisions to evaluate the vehicle wreckage and accelerometer readings on impact loadings to dummies riding in the crashes, and then to correlate these impressions with their field experience in studying actual accidents or performing autopsies and clinical follow-ups on human victims of the crashes. They would already be familiar with the human tolerance to impact forces, and, in essence, would be relating this knowledge to their impression of the wreckage.

By comparing the independent judgments of several scientists, it is anticipated that a valid assessment of a vehicle's crash survivability under controlled test conditions can be made. Medical-engineering assessments alone will not yield a meaningful comparative rating because resources will not permit destructive testing of all make-model combinations.

A valid comparative crash survivability rating system will ultimately depend upon development of mathematical techniques that will allow computer "crash" simulations. The development of the necessary mathematical modeling techniques will be discussed in the next section on vehicle frame deformation analysis.

#### *a. Vehicle Frame Deformation Analysis*

A vehicle in a crash is subjected to the impact forces which produce the deaths and disabling injuries to occupants. It is highly important to know the impact vectors (defined as the direction and magnitude of these impact forces) to identify how the vehicle frame and body structure, as well as such interior features as safety belts, could have improved its crash survivability properties. This impact information is vital to learning how best to improve the crash survivability of the vehicle.

In addition to causing disabling and fatal injuries to occupants, the impact forces can produce substantial deformation of the frame and body structures of the vehicle. These deformations remain after impact, and if later measured, can, in principle at least, provide important clues as to the impact forces that produced them. At least one major manufacturer of automobile frames has indicated that by measuring frame deformations, it may be possible to reliably estimate the crash forces that produced the deformations. The Bureau proposes to encourage, and perhaps sponsor, systematic evaluation of these methods.

An even more fundamental aspect of this approach is to develop mathematical equations that describe the manner in which crash impacts produce vehicle frame deformations. If such equations can be developed, it should be comparatively straightforward to program modern high-speed computers to simulate a crash and determine the probable crash survivability properties of given vehicle frame design. This methodology is analogous to that which has been highly successful in aerospace applications, but which as yet have not been utilized to any substantive degree in the motor vehicle area.

The computer simulation of vehicle frame deformation produced by crash impact forces would permit much of the analysis of crash survivability properties of a vehicle frame to be accomplished without resorting to expensive and time-consuming destructive tests of full-scale vehicles. Furthermore, it would allow for scale model testing, obviously at much lower cost than by testing of full-size prototypes. It should be noted here that by the time a full-size prototype is available, the design investment is so great that any substantial change would be effected only at very high costs. This is another important benefit that will result from the development of the output of properly validated analytical methods. Finally, these methods will make it possible to eliminate much of the expensive and time-consuming destructive test methods now required to ascertain compliance with applicable Federal standards.

The essence of the vehicle frame deformation program is directed toward developing the capability of mathematically deducing impact forces from precise measurement of deformations that produced them. The program is comprised of a complete cycle of activities, the major steps in the cycle being:

*Step 1:* Develop mathematical equation of frame deformation under impact.

*Step 2:* Apply the equations to scale models of vehicles.

*Step 3:* Subject the scale models to impact forces, and analyze the resulting data with computers.

*Step 4:* Apply the equations to controlled impacts with full-size prototype models, and analyze the resulting data on computers.

*Step 5:* Modify the equations if the analytical do not coincide with the force and deformation measurements, and repeat the process.

#### **b. Medical-Engineering Accident Investigations**

The output of the vehicle frame deformation program will be the capability to correlate vehicle frame deformation and impact forces. In a parallel program of the Bureau comprised of medical-engineering investigations of accidents, correlations of occupant injuries to vehicle deformations are being sought. By combining these correlations it will be possible to relate occupant injuries to impact forces.

In the accident investigation program, research teams consisting of engineers and doctors are conducting in-depth investigations of crashes throughout the country. The teams conduct detailed investigations at the scene of a crash. In the detailed follow-up physicians conduct either autopsies of the fatally injured or extensive clinical studies of the hospitalized; the engineers perform engineering analyses of the damaged vehicle. The independently generated sets of injury and vehicle damage data are jointly analyzed to establish correlations between vehicle design features and injury patterns.

Medical-engineering teams from seven universities throughout the country are now participating in the program (Appendix 1). Additional universities have indicated interest in joining the program and plans have been completed to expand the program to a total of 17 teams in FY 1970.

The importance of the Bureau's research effort in crash trauma has been widely recognized. Thus, the American Medical Association has recently announced an independent \$50,000 grant to the Bureau's primary contractor, the UCLA Trauma Research Group, to train 50 two-man teams (one from each state) in crash trauma techniques. Each team will be comprised of a physician and a high-ranking police officer responsible for accident investigation. In excess of 400 physicians have expressed interest in joining the program, which is to start in late Spring of this year.

The experience and the expertise of the medical-engineering accident investigation teams will be utilized to interpret the results observed in the controlled collision tests in terms of the probable injury patterns human occupants would experience in similar crash conditions. In brief, a medical-engineering team would observe each controlled collision test, conduct a post crash examination of the vehicle and the anthropometric dummy, view the high speed photography of the motion of the dummy, analyze the force data and evaluate the results in terms of possible human trauma.

A more detailed description of the role of the medical-engineering team in the comparative crash survivability program is given in the next section, (c) Controlled Research Collisions.

#### **c. Controlled Research Collisions**

The medical-engineering teams are able to assess crash aftermaths such as the damage to vital organs of the occupants. They also can judge with some precision the part of the vehicle interior that caused the injuries. However, they can only speculate on the crash impact forces that produced the damage. The ultimate full understanding of the mode in which alternative vehicle structural and design configurations affect its crash survivability depends directly on the capability to measure these impact forces and relate them to the concomitant damage they produce to the vital organs of the occupants.

Controlled collisions under carefully defined conditions of impact are the principal means of accomplishing the cross-linking of the impact forces to vehicle damage to the trauma production in occupants. Live human subjects cannot, of course, be used in these tests. Instead, anthropometric dummies ride in the vehicles. Accelerometer and other force-measuring instruments are installed in various locations in the dummy comparable to where vital organs would be located in humans. The instruments record the forces sustained by the dummy, while high speed color photography records the movements of the anthropometric dummies. The records are interpreted by pathologists and other medical scientists as to the likelihood that similar forces would produce comparable damage to humans.

The use of anthropometric dummies and other devices to simulate human response to forces is comparatively new and far from an exact science as yet. However, even in its present state of development, it is providing the major foundation of all of the Federal standards relating to the crash survivability of vehicles. For example, Federal Standard 201 on occupant protection in interior impact, calls out a performance standard that a sphered form (as an analogue of the human head) shall not under specified impact conditions sustain a deceleration in excess of 80g continuously for more than 3 milliseconds when it strikes the vehicle's instrument panel.

The controlled collision is the only method whereby a vehicle can be crashed under pre-determined conditions that are capable of being measured and correlated with the resulting damage to the vehicle and to the force impacted at the vital organ location points within the anthropometric dummies. By systematically varying the pre-set impact conditions, the comparative crash survivability effectiveness of alternative vehicle frame and body configuring can be assessed. It is mandatory that this assessment not be limited to the frame deformation analysis, but instead include correlations with the forces produced in the vital organ locations in the dummies.

Stated otherwise, within the present state of the art, there is no proven way other than controlled collision methods, of correlating the design characteristics of the vehicle frame and body (as a total packaging system of humans) with the forces sustained by the occupants in a crash.

By the same token, forces produced upon anthropometric dummies in the controlled collisions are only indicators of the degree of damage to human tissue that such forces would produce. Apart from controlled impact studies with primates, there is no way of determining the nature and extent of damage that these impact forces will cause in living human tissue and bones. There is no way, that is, except by on the spot analysis of accident victims followed by autopsies of the fatally injured or, if the victim survives, by extended clinical surveillance. This is, of course, a primary purpose of the Bureau's medical-engineering investigation of accidents.

The medical-engineering investigations, however, do not know precisely the impact forces that produced the human tissue damage that they observe in the crash aftermath. The vehicle frame and body deformation measurements can provide the most important evidence in this respect, particularly if the observed damage to the vehicle can be rated or otherwise compared with the vehicle damage observed in the controlled collisions for which the precise conditions of impact are known.

Imperative to the evaluation of each controlled collision test is the integration of results into the overall crash survivability program. The visible crash result of one car, when compared with another subjected to an identical test, provides only a very gross indication of relative survivability. Indeed, any conclusions drawn from merely viewing the crash event may be completely erroneous. Complete evaluation of the recorded data together with detailed film analysis and careful measurement of structural deformation must be performed. Medical/engineering field personnel will be key participants in this evaluation. They will be called upon to assess the probable injury level to occupants by evaluating the acceleration, time exposure of the dummy, the relative motion of the dummy and any dummy contact with structure, physical damage to the dummy, and passenger compartment integrity. Injury level predictions will be referenced to the field experience of investigations of actual highway accident crashes. Frame deformation and structural damage will be carefully analyzed, used as a comparative element with on-the-road crashes, and provided as an input to frame deformation math models for verification of the analytical work.

Through the medium of frame and structural deformation and medical/engineering team experience, injury severity predictions will be progressively refined. Injury indices will then be provided to the analytical model, leading to the capability of predicting (based on non-destructive "computer crashes") the probable injury severity of occupants in any car, given the knowledge of its basic frame and structural design and the crash mode.

Thus, the three elements of vehicle frame deformation and analysis, medical-engineering investigation of accidents, and the controlled research collision comprise an extremely powerful group of programs that together can lead to vehicle crash survivability ratings that are reliable and reflect actual loss inherent in highway crashes.

Appendix II contains a detailed controlled collision plan.

## PART III.—SUBARU AND KING MIDGET TESTS

During the preliminary phase of the comparative crash survivability program intervehicular collision procedures were developed and tested and the first controlled vehicle to vehicle collision tests were completed. Selected for the first tests were two "mini-car" class vehicles—the Subaru 360, a Japanese import and a King Midget, manufactured in Athens, Ohio. Cars from the mini-class of vehicles were selected for the first tests because of the inherently high degree of risk of serious injury or death occupants would be subjected to in the event of a crash, by virtue of their extremely small size.

### 1. "Mini-car" Definition

For purposes of this report a "mini-car" is defined as 3- or 4-wheeled vehicles designed as a passenger vehicle for use on public highways and weighing less than 1,000 pounds.

### 2. Exemptions from Federal Standards

With two major types of exceptions, all vehicles manufactured on or after the date of effectiveness of the Federal safety performance standards must comply with the standards. The first class of exempted vehicles is the so-called "mini-cars," that is, passenger cars under 1,000 pounds in weight as defined above. The exemption was granted because at the time the standards were issued, there was no apparent way to write a standard calling for a reasonable level of safety performance which would not immediately rule all mini-cars off of public thoroughfares. Inasmuch as comparatively few mini-cars were in use then, it was decided that they could be exempted as a class from the standards pending more thorough analysis of alternatives.

### 3. Mini-Car Crash Survivability Tests

As long as comparatively small numbers of mini-cars or antique (or other) small volume vehicles were in use on the country's public thoroughfares, low priority was assigned to the engineering work that had to precede lifting exemptions and bringing these classes of vehicles under appropriate Federal safety regulations. With increasing reports in the trade journals of an impending influx of mini-cars into the United States market (since confirmed by a major new advertising campaign on Subaru in California), the Bureau initiated an immediate analysis of mini-car safety.

The first phase of this program called for an engineering examination of the Subaru and a domestically produced mini-car of approximately the same weight, the King Midget. The principal purpose was to determine if either of these two vehicles could meet Federal standards if the exemption were to be removed. The results, tabulated in Appendix 1, were negative, that is, neither could meet all of the Federal standards without what would appear to be major changes.

Another purpose of the tests was to obtain a qualitative indication of the comparative crash survivability of each of these vehicles. In this regard, both demonstrated poor crash survivability in 30 mph head-on impacts with standard size cars.

### 4. Council Recommendation

Results of the Subaru and King Midget tests, including high speed films of the crash impact, were presented to the National Motor Vehicle Safety Advisory Council on February 14, 1969. The Council then adopted the following resolution: "That 3- or 4-wheeled vehicles designed as passenger vehicles for use on public highways be required to comply with Federal standards regulating safety of such vehicles, even if their weight does not exceed 1,000 pounds."

### 5. National Policy

The high hazard inherent in the mini-cars tested is unmistakably clear from the test results, as reflected in the Council resolution. The severe hazard, however, cannot be the sole consideration in arriving at national policy; a number of other factors must also be examined.

There is considerable doubt that this class of vehicle could be made to conform with present or projected Federal standards. But even if this proves to be possible from an engineering standpoint, it likely would be accomplished only by adding additional weight and cost which would largely compromise the basic purpose of this type of vehicle—namely cheap transportation.

Another question that comes up is the safety of the mini-car compared to that of a motorcycle. A similar question relates to the comparative hazard in a "standard" passenger car striking a heavy truck.

Still another issue relates to the types of roadways on which admittedly dangerous mini-cars could be operated in comparative safety.

Since many states already prohibit 2-wheeled vehicles (i.e., motorcycles and scooters) from high speed expressways and freeways, this, in turn, suggests the alternative of limiting the mini-car operation to comparatively low hazard low speed local neighborhood streets.

These and other issues must be considered in arriving at national policy on mini-cars. Clearly there will have to be some trade-off between safety and cost. The test results to date suggest that the two vehicles tested present more than a tolerable level of hazard, and although the degree of safety that can be incorporated in a mini-car while keeping the weight and cost down is as yet unknown, it does seem possible to achieve a higher level of mini-car crash survivability than that demonstrated in the tests thus far.

#### VOLKSWAGEN TEST

The results of the Subaru and King Midget tests demonstrated the need for intervehicular crash testing and vividly pointed out the potentially serious safety problems small cars present by virtue of their size alone. This led to the decision to move up into the next weight class (1,000-2,000 lbs.), which is representative of a much larger segment of the automobile population, and the selection of a 1969 VW "Beetle" for the next test.

The VW was selected because there are more VW's in that weight class than any other single vehicle and because there is statistical data which suggests that occupants of VW suffer a disproportionately higher rate of serious injury and fatalities.

A 1969 VW-1500 was crashed head-on with a 1957 Ford. Each vehicle was travelling at 29.3 mph at the moment of impact. Accelerometers were mounted on the frames of both vehicles and each contained an anthropometric dummy restrained by an upper torso and lap belt.

The dummies were similarly instrumented, with each containing triaxial chest accelerometers and longitudinal accelerometer in the head cavity. In addition, high speed (1000 frames/sec.) color photography was obtained.

Both seat back locks failed in the 1969 VW. The restraint belt on the dummy in the 1969 VW failed where the belt goes through a center anchorage point. As a result of these failures, the chest of the dummy in the '69 VW smashed into the dashboard and the head went through the windshield opening and banged on the hood of the VW. Analysis of the high speed photography and the accelerometer data indicate it is doubtful that a human could have survived that particular crash.

In summary, the few tests that have been completed to date have produced a great deal of extremely useful information. The mini-car tests dramatically demonstrated the need for all cars licensed to be on the highways to meet the Federal safety standards. They also clearly pointed out the inherently greater safety problems associated with their exceptionally small size. The VW test, although far from being conclusive, did show up the failure of the front seat back locks and a seat belt that may indicate possible safety defects and has caused us to reexamine the adequacy of our safety standards in this area. However, the major conclusion to be drawn from the tests to date is that this type of testing has potentially very high payoff and must be continued.

#### IMPLEMENTATION

Inasmuch as the foregoing concepts deal with new and complex problems, detailed plans for implementation are now in the process of being developed.

Mr. NADER. He said that the Bureau had completed initial program planning work for the projected 6-year program; that within 30 months—that would be May 1972—the Bureau should be able to publish quantitative ratings of the survivability characteristics of vehicles by weight class based on analysis of accident data with limited crash testing; that at the end of fiscal year 1975, the Bureau will be able to augment the first vehicle rating schedules by rank ordering the auto-

mobile population by make and model according to quantitative measures of their overall crash survivability characteristics, based on not only statistical but also on significant crash testing experience; and that vehicle to vehicle crash testing would resume in December 1969 and make and model measurements will be obtained from crash tests conducted for other Safety Bureau purposes. This program has never been carried out, having been pigeonholed by the Office of Management and Budget with the full sympathy of Mr. Frank Turner and Mr. John Edwards who has been acting chief of the Safety Administration research program since January 1970, in his capacity of grounding the program.

Against this background, S. 976 reads as if what the Department of Transportation needs is another round of discretionary authority—to find feasibility or not—and another round of “as soon as may be practicable.” The Department admitted 2 years ago that such an undertaking was clearly mandated in the 1966 act. Stronger imprints of the committee on the Department’s consciousness are needed. You can start by asking the Department when it testifies here on Thursday about the current status of these promises to Senator Hartke and watch another outpouring of bureaucratese. Ask them for the results of the testing since 1969 when they testify before this proceeding.

2. Section 125(a) of the bill mandates regulations on tests and procedures for comparison of susceptibility to damage of passenger vehicles involved in crashes by July 1, 1972. The bill should require that these tests emphasize energy absorbing qualities in vehicles crashed at low speeds—so that the vehicles don’t trade off safety for property protection. Both qualities can be achieved by liberated engineering talent.

3. The bill’s bumper standard provision is now virtually obsolete, because of the Department of Transportation’s regulations. Two States have already passed more stringent legislation than DOT’s regulations—Maryland and Florida—and other States have legislation pending at comparable levels of stringency. S. 976 should require a no-damage standard for 10 miles per hour for 1975 vehicles and eliminate the loophole contained in the phrase “a minimum prescribed amount of damage as may be determined by the Secretary.” Here is an area where, if any minimum level is to be given, it should be contained in the legislation.

The committee should make it clear that such components as the following be covered by any regulation: Steering, frame, power train, suspension systems; braking systems; electrical systems, battery and battery mounts, tires, wheels, windshields, windshield wipers, side and rear windows, hood, trunk and door latches, fuel systems, cooling systems and sealing devices, exhaust systems and turning radius.

4. More important to safety than property loss reduction is protection of pedestrians by proper exterior design of vehicles. On December 28, 1967, the Department of Transportation published a proposed standard (covering only ornamental protrusions) for pedestrian protection which has never been issued as a final standard.

In response to the proposal, after complaining that it was premature and not written in objective terminology, the collusive Automobile Manufacturers Association urged that the Highway Safety Administrator, then Dr. William Haddon, issue advisory letters to

vehicle manufacturers because "such advisories would have a beneficial effect upon safety performance and help to advance the development of meaningful standards. Use of such an advisory standard would help in giving manufacturers advance notice of the Administrator's goals and reasonable leadtime where these and technical considerations preclude making a standard effective in as little time as 1 year. By judicious use of advisory letters in a case like this one—where no test procedures, performance criteria, or injury tolerances are available—the Bureau and the automobile manufacturers could pursue their common goal of greater motor vehicle safety free from the difficult legal obstacles that arise where statutory penalties may be involved."

So said the Automobile Manufacturers Association. Tell the AMA's belief that no injury tolerances or test procedures are available to the thousands of pedestrians, many of them children, who have been impaled on a hood ornament or a leering, sharp fin structure, or other sharp edges on the car.

Tell the little girl's parents, in a Washington suburb, who saw their child impaled on a Cadillac tail fin and die about 8 years ago, that there are no available injury tolerances or the little black child in Chicago similarly impaled on a vehicle ornament or the tens of thousands of pedestrians whose injuries are cruelly aggravated by an industry still waiting for "proper test procedures." They could have listened to the Greek physician, Hippocrates, who over 2000 years ago stated the verity that the human body is more able to tolerate safely colliding against a flat surface than a sharp, cutting edge. Some 500,000 pedestrians are injured every year in contact with motor vehicles; about 10,000 are fatally injured; most survive, but their injuries are worsened by this stylistic pornography of the auto companies—witness the bristling front ends of many contemporary or new models.

Almost simultaneous with the submission of these comments, Dr. William Haddon wrote a letter alerting manufacturers to the dangers of exterior vehicle protection, dated December 21, 1967 (p. 368 of the April 25, 1968, hearings before the Senate Commerce Committee).<sup>2</sup> So there was the advisory solicited by the AMA. General Motors in its comments to this docket stated:

It is estimated that a minimum time of one year will be required to complete the necessary studies and to correlate these data with actual accident information. In the meantime, we are using our best judgment in elimination of projections such as hood and fender ornaments and winged projections on wheel covers and similar items until meaningful standards can be developed.

And they did improve some of these things in subsequent years.

Typically, GM displayed its intent on its cars, not its words. Here for the records are recent advertisements by GM actually touting the return of hood ornaments for some of their 1971 models—ornaments which for their bendability still pose a rigid hazard on downward impact as pedestrian-car impact studies show occur. This was the company who in 1966 urged the committee to permit voluntary standards rather than impose mandatory standards.

Congress should mandate a pedestrian protection standard by a specific date by amending this bill, S. 976.

<sup>2</sup> See Senate Commerce Committee hearings record, serial No. 90-89.

(5) Section 127(a) requires the Secretary to publicize the information supplied to the Secretary by vehicle manufacturers under the Department of Transportation tests for damage susceptibility and crash survivability. But this provision is not specific enough and thus repeats the deficiency of the 1966 act.

It is recommended that the committee develop a detailed program for consumer access to this information cheaply, expeditiously and at the most convenient places. The use of television should not be excluded to inform consumers of the existence of this information and where it can be obtained.

Evidence of past failure is abundant. For example, the Department of Transportation consumer information booklet is almost an unknown to the public; the Department does not publicize it well and dealers do not make it easily accessible to customers. This reduces severely the competitive forces that could be put to work.

In the recent compilation of consumer information braking performance of 1971 passenger cars supplied by the automobile manufacturers to the National Highway Traffic Safety Administration under the 1966 safety law, Ford vehicles dominated the lowest ranking automobile brake stopping capability. In the bottom eight out of 74 rankings, 11 of the 13 model vehicles were Ford-manufactured. Ford is obviously reluctant to supply customers with this notorious record which the law requires them to make easily available at the showrooms and to supply with every new vehicle. This is the second year in a row that such Ford braking performance dominated the lowest rankings. Without congressional stipulation, such a pattern would give Ford and other companies too many years to get a better idea.

Section 127(b) requires that any information about identification of parts, components, systems and subsystems damaged or displaced in vehicles be given to insurance companies by the Department of Transportation. This section should be amplified to assure that it is also available to the public. This section also requires the Secretary to report to the President and the Congress on the extent to which the auto insurance industry is utilizing damage susceptibility and crash survivability information in determining insurance premium rates. Why does it fail to require the insurance companies to actually rate cars on the basis of this information? Such a requirement will also spur the insurance companies to begin data systems which they now lack on the causes of accidents. This has been one of the most significant obstacles to developing market pressure on the auto industry by what should be countervailing powers such as the insurance industry. Also the Department of Transportation should be given authority under section 112 of the act to require information from insurance companies to comply with this bill's provisions.

To be more specific, how many taillights has Chevrolet sold to replace Chevrolet lights on existing cars which have been damaged at low-speed impact when rear ended? That would be the kind of documentation that would show the vested economic interest in a fragile, ornamental bumper.

The committee might also consider whether any improvements can be made in this vast area with the Government having its own research testing and proving ground facilities which indeed are stipulated in the 1966 law and still not implemented, as well as a mission-oriented

prototype program to actually build the prototype vehicles, systems, components that are suitable for mass production as a permanent yardstick for industrial prevarications, suppression and collusion in violation of the antitrust laws. The single most important program is this prototype, testing program, for in the actual performance, priorities are reordered and the facts speak for themselves.

I would like to also include a request for the following.

There is a lot of talk about what these changes will cost. I think the structure of the industry's testimony is based on a number of foundation stones; namely, that there are certain priorities such as safety and pollution and they should take first priority before this, and this is a tradeoff between property damage prevention and safety, and the consumer will ultimately have to pay for it, and the consumer has a right to choose and the costs are so high that there has to be a slowdown in the kind of changes requested under the various laws and the proposed bills. All of these are propositions to be examined, not articles of faith to be accepted.

For example, if there are priorities between, for example, expenditures on safety and pollution and expenditures in the property damage area or the repairability area, then let's bring in other priorities. Why build such big overpowered engines which cost more? Why not eliminate it and all styling and excessive product proliferation change which would save the industry almost \$2 billion a year or more per year and the consumer an immense markup beyond that?

For example, I think the previous witness gave the figure of under a hundred dollars for the cost of styling in terms of tooling. But the real costs are the costs to the consumer and the stepup-markings as it goes through the wholesale-retail consumer marketplace hierarchy.

(6) Section 127(b) (3) authorizes the Secretary to establish procedures requiring auto dealers to provide insurance cost data to prospective purchasers. This section should apply as well to information developed under section 112(d) of the existing law (consumer information program) and to the information required to be reported under Department of Transportation regulations by motor vehicle manufacturers under proposed section 125 and 126 to be added by the bill—that is damage susceptibility and crash survivability. A study last year by the Insurance Institute for Highway Safety and another study by the Department of Transportation showed that dealers most of the time fail to inform prospective purchasers of the consumer information materials. In the absence of sanctions directly to dealers, which should be added to section 10 of S. 976, the charade will go on and any government effort and expense to that point will be wasted.

(7) Section 128 of the bill requires the promulgation of Federal motor vehicle safety standards and property loss reduction standards effective January 1, 1975, under which vehicles must be designed and constructed to facilitate motor vehicle inspection (presumably meaning diagnosis of faults as well as ease of locating faults) and repair. Since the Department of Transportation has already testified—in March 1970—before Senator Hart's Antitrust and Monopoly Subcommittee—that a number of motor vehicle safety standards have already been issued by the Department and others are under development which incorporate provisions for reliability of critical vehicle com-

ponents, ease of diagnosing vehicle malfunctions, ease and accuracy of repairing safety critical parts, and reduction of vehicles' structural fragility, the bill should more specifically indicate the type of results expected by 1975, at least the performance standard by which the Department's activities can be measured.

The Department's outright violation of the statutory deadline for the issuance of used car standards—due on September 9, 1968—and still not issued—should be instructive to the committee.

Finally, the bill should provide the Department with explicit information procurement powers vis-a-vis the automotive industries. In the meantime, the committee should design a questionnaire which it should send to the industry, company by company, to accelerate the production of much needed information. Information about engineering dissent within the companies over designs that bilk the consumer, information about alternative component and systems design which could avoid the economic crimes and casualties due to contemporary vehicular design, overregistration of odometers and turning back odometers at the retail level, which is a flagrant violation. Also why GM's Motors Insurance Co. dislikes its parent company's Corvette. That immense secret data in MIC's files could be so useful for Congress' understanding and public enlightenment. Information about the extent of the "crash parts" industry is also needed. That is not my phrase, it is a phrase used by dealers and people in the industry who discuss the crash parts industry which is basically the sale of parts to replace those that are smashed up at low-speed impacts, often at under 5 miles per hour. It would be important to know the extent of this crash parts' industry to see how many sales in dollar terms the automobile industry will lose if it put bumpers on cars at 5- or 10-mile-per-hour protective levels. This would give us more understanding as to the kinds of statements that are being made resisting more adequate bumper protection and in a totally unsubstantiated way stating that a functional bumper to the 5-mile-an-hour level will cost the consumer \$100 or more per year.

A study over 10 years ago by a group of Harvard and MIT economists which I think has been cited to you before, showed that in the late fifties it was the judgment of these economists that the annual style change had a retail cost to the consumer of about \$700-plus, and that was way before these costs have gone up. That, of course, is a very significant proportion of the consumer's dollar and it allows a great deal of leeway to supplant this expenditure with the property damage prevention systems and the other improved qualities certainly which have priority over the styling.

Needless to say the priorities also should bring in the question of costs, production costs. The committee really cannot make a decision here unless the companies are willing to display their production costs. If they are going to say it costs the consumer too much, we can't improve this or do that, dealing with safety or pollution or property damage prevention, then, they should actually disclose these costs.

Needless to say that one of the most impressive things about the auto industry is the enormous efficiency, the enormous productivity factor efficiency which permits mass production of components to be produced at prices that would boggle the mind of the average consumer.

This efficiency is, of course, an area of great secrecy because if the consumer realized how little it cost to change things at the hardware

stage, he might become more insistent on the change being made. That holds true for government officials as well. The white-collar cost, the transportation, distribution markups—those are all constant costs as far as vehicle design is concerned, but where the industry is most efficient is in the area of actual manufacturing, and it is remarkable what they can do in terms of their mass production economies prior to markup, and that is a figure that really is relevant for disclosure.

There is also an important point to be made about whether the consumer will ultimately have to pay for it. This is the antithesis of the market system philosophy. A company which comes up here and stands up in public and says the consumer is going to have to pay for this excessive markup or if it is going to cost \$400 more the consumer will have to pay, how do they know? If they were really competing with one another they would not be able to say that they are going to automatically transfer the cost on to the consumer of a particular safety feature or a product improvement, because they would not know whether their competitor was going to say I am going to cut out styling in order to put in more safety so I do not have to transfer the cost on to the consumer.

This kind of attitude which is true of many other industries which are oligopolistic, simply saying as a categorical fact the consumer will have to pay for it, illustrates the enormous market imbalance between the few select producers and the large number of consumers. They can actually administer the transfer of these prices.

Once again the question of what the consumer will have to pay for raises a question: If indeed the consumer has been shortchanged over these years and he is going to be less shortchanged why don't these expenditures come out of profits? I recall reading that General Motors made \$600- some million worth of profits in the last quarter, perhaps more than they usually make because of the strike, but that company is twice as profitable in its return on investment as American industry in general.

There are economists who have made the claim that these are oligopoly profits, excess profits which would not occur if there was adequate competition over significant facets of the industry, horizontally and vertically. Why shouldn't this come out of profits? Why should the fact that the companies once they are caught by a Senate investigation that they are not doing well by the consumer, that they are in effect accelerating an aftermarket which is not necessary if proper design was implemented in the first place, why shouldn't this come out of profits? I think that is a good question to ask.

The other approach which is particularly ingenious by industry spokesmen is how they give an inflated cost figure, for example, to improve bumpers so they protect cars up to 5 miles per hour, and then they in effect assume that the auto insurance industry is not going to reduce their premiums, and they have a full cycle theory as to why they should not be subject to the dictates of this legislation. It is going to cost the consumer so much, no substantiation, and the auto insurance industry is not going to reduce the premium, and they have not showed they are going to reduce it because they want to keep their profits much higher.

Therefore, it does not pay for the consumer to have this kind of protective bumper. I mean, this is the kind of cycle argument which

rests on assumptions that are not disclosed and which rests on the assumption that nothing can make the auto insurance industry pay attention to declining loss claims in the readjustment down of its premiums. Needless to say, posting the course of action on these self-serving declarations requires an examination more thoroughly than has been the case.

Note the other argument, consumer choice, which is often paraded before Senate committees. What kind of consumer choice does the consumer now have? Did he ever have the consumer choice when buying Pontiacs or Cadillacs to delete the fins and take a \$200 price reduction? Did he ever have any consumer choice in the kinds of mandated styling changes? I would assume if it is to be extra cost optional it should be as to style rather than is the case where safety is often introduced as extra cost optional rather than the enormously costly styling changes.

Note again the argument that if a consumer wants to buy a Jaguar and pay \$8,000—actually a more relevant example in terms of numbers would be the Corvette, which I assume Mr. Nevin can be forgiven for not mentioning—but if he wanted to buy a Jaguar or a Corvette and the bumpers are so trivial that a 5-mile-an-hour collision would jack up damage cost to \$400 or \$500, then he should be able to do this, says Mr. Nevin and other spokesmen.

In the first place, I thought the point made by Mr. Sutcliffe in terms of the present existing liability system and people losing their policies because they ram into a car that generates that kind of avoidable damage was well taken, but there are other examples, too. There is a shortage of mechanics in this country, a very severe shortage of mechanics, and the more work the mechanics and other personnel in these areas have to do repairing cars that never had to be repaired in the first place, the less work and the less expertise they are going to develop in the more critical areas.

Our courts are overburdened enormously by accident litigation. That also generates a public interest factor into the kinds of standards that the committee is considering in the present bill.

There is also the problem of disabling cars on the highways. The worse a car is damaged the longer it is going to be on the highway, the longer it is going to raise the risk of something that is quite frequent, the secondary accident, the cars coming up and smashing into the cars that are on the highway. We see these things I think in a way where the highway accident injury transport automobile system is so interwoven in relations between people and the public interest that to make that kind of statement about consumer choice when so much real consumer choice is prevented or deprived I think is not particularly responsible.

The final point I would like to make deals with the styling issue, and I would like to submit later for the record the Yale Law Journal<sup>1</sup> note on styling as an anticompetitive factor and as a high cost factor, furthering concentration in the automobile industry, a remarkably original job, which I think will do some of the work for the Antitrust Division which the Antitrust Division has not done in pursuance of its own enforcement missions.

I think the committee should know by now that no more than 10 percent of what any consumer law the legislature tells the executive

<sup>1</sup> See p. 1315.

branch to do ever gets done. In some cases the percentage is much less. Measured against the weakness and the gaps in the present bill, what would 10 percent of that give the consumer in justice or the corporate institutions in law and order?

I think one of the reasons perhaps why Senator Griffin became somewhat disappointed by my comments about the committee is perhaps the fact that he has not been around on this committee to listen to the utter unchangeableness of the position of the Department of Transportation since 1966. We are dealing here with a committee's will which has been flouted significantly, substantially, a committee that has held oversight hearings, has gotten assurances which have not backed up, which indeed have not even been recognized subsequent to the committee's hearings; we are dealing with an entrenched obstinance on the part of a department in the executive branch from even meeting statutory deadlines that are in the law.

I think, of course, the Department deserves a critical scrutiny from the chairman when it comes up before the hearing, but the last resort of the citizen is this committee. What else is there left? What committee has the authority to get the information? What committee has the authority to recommend the kinds of changes and sanctions that will get something done?

I will just leave you with one question. Here we have a situation where American consumers are bilked out of billions of dollars a year through unnecessary auto repair costs, through fragile bumpers that generate hundreds of millions of dollars of avoidable damage, through a retail and insurance scheme that piles on the costs even more, and against this tragic situation of waste of consumer income, which can be used to purchase other, more functional goods and services that are so badly needed, including housing, medical care, health, and the like, against this background, is there anybody in the auto industry today or in the Department of Transportation who will even be demoted or lose his job as a result of this volume after volume of facts showing gross irresponsibility, gross flouting of statutory mandates and gross contempt toward the consumer? The answer is "No."

As long as institutions are run in Government and in business by individuals who have absolutely no exposure to legal sanctions, minor or major, these institutions will continue to in effect flout the law and to flout common standards of decency in the marketplace and to suppress the creativity and initiative within these Government and corporate institutions which often do not get to first base because the rule in a bureaucracy is that you get along by going along.

Until we face the problem of sanction in Government and in corporations and in any large organizations, all this that we are doing is in effect going to be so much charade, and I think after 5 years and after looking over the records of the hearings it can be said that the legislation in 1966 has been a tragic failure in the automotive and tire safety areas, and although it has been a tragic failure, it has been more successful than any other consumer bill in the last 5 years passed by this committee.

Thank you.

Senator HART. Thank you, Mr. Nader.

No matter how I respond, it will be interpreted as either agreeing or disagreeing with all of your gospel.

I would like to focus on that very concluding comment, not to twist it either. As you recite deadlines that have gone unmet, continuing design patterns which contribute to both personal injury and property damage, I agree with you that the legislation and the agencies—that is, the Congress and the agencies and the industry have not performed as one would have thought, and yet with respect to the legislation, though it may be small comfort to the consumer advocates, it has probably produced more progress than anything that has come through the pipeline here.

I know what a critic of the system would say, that proves the system produces damn little, but those of us who are trying to get anything through the pipeline always relate the product to the energy we put in to get that little through.

So we tend to overestimate the significance of what we do. To the extent progress can be said to have been made in this particular area, while your views of Detroit continue to be very poor, I continue to subscribe to the belief that you more than anyone else in this country has contributed to that improvement. You are very harsh with respect to the legislative proposal that you analyze here, which happens to be mine, but some of that criticism I think is constructive. Some of your suggestions with respect to the improvement that we could make I think are good.

My views initially in Detroit are not quite as bad as yours, but nevertheless I am not their favorite Senator.

You commented at length on S. 976. You were invited to comment on the no-fault insurance bill S. 945 and the group insurance one, S. 946. Would you be prepared to make comment on those for the record?

Mr. NADER. I haven't studied the bills, Senator. I can say this much, however. One preliminary note, there is no criminal penalty in the auto safety legislation, but in this bill dealing with no-fault, you have got three instances of criminal penalties.

One applies to an individual motorist who doesn't comply with the provisions of the bill, and I find that an example of the double standard that I don't think should be the case when it comes to the automotive industry, particularly since the violations under the insurance bill are far less serious on an individual basis than could be the violations coming from the auto industry under the Automobile Safety and Tire Act.

I would like to just make the following comments. I haven't studied the bills in detail. I restricted my comments to S. 976 because of its preventative thrust, the system of insurance claims resolution in this country is obviously an abominable one and tremendously wasteful and has been indicted again and again by scholars and practitioners alike—government practitioners, and you could hardly conceive of a more cruel system in terms of the numbers of people who don't receive any compensation for their injuries as well as the injustices that often occur within the framework of compensation.

As far as changes are concerned, the first recognition is who has a vested interest in the present system, and the insurance industry has substantial vested interest, certainly a portion of it. The plaintiff's bar has a substantial vested interest. The defense bar has a substantial vested interest.

In deciding what other proposals should be made, I think first we have to ask ourselves to what extent will all of these vested interests distort and ruin any proposal that now is made. In anticipating that kind of countering strategy, the bill might have provisions that would consider that kind of rear guard or ruining impact.

I bring before your attention, if it hasn't been brought before, the Puerto Rican system which came into effect about a year and a half ago which is a Government-run system where the premium is collected, I believe it is \$35 a year at the time of registering the vehicle. The experience under that system, which is now available, is almost too good to be true, and while it is clear that the Puerto Rican situation is not quite analogous with the mainland situation, particularly with regard to the expectation levels of recovery and the number of motorists who are insured in this country, it bears close watching.

In short, the suggestion is that the committee give particular attention to setting up a yardstick in this area, a Government-run yardstick much like the Tennessee Valley Authority in order to permit an undiluted attempt at experimentation for a more rational system.

It doesn't have to be a very large system, but the fact that it does stand as a yardstick by which to measure private industry's performance I think would be very salutary.

Senator HART. We did have testimony one day last week from the administrator of the Puerto Rican system and his strong recommendation in support is in the record.

We will have some trouble I assume getting a majority of votes for a no-fault concept. So, if there is something you would like to add to the record in support of this concept, we would welcome it.

Senator HART. The Senator from Alaska?

Senator STEVENS. Mr. Chairman, I don't have any questions. I would like to make a statement.

I think that you could accomplish a great deal more than what you wanted to, if you would give credit where credit is due. I am of the impression that the American public believes that there has been a great deal of progress in the field of safety; that we are committing a great deal more of the attention of the manufacturing process to design safety problems.

On the other hand, I find it staggering to realize that one out of six people in this country buying new cars are buying foreign cars. Yet no part of your statement pertains to the foreign cars that represent the loss of dollars, the loss of jobs for the United States, and the total inability of the Congress to deal with product safety as far as the foreign manufacturer of automobiles is concerned.

I think it should get a great deal more attention from organizations such as yours. The concept of holding up the American manufacturers to the type of adverse criticism that you have given them and at the same time leaving their competitors completely free of any criticism and completely free to come into our markets with what I consider to be absolutely inferior products, seems to me to be a definite defect in your approach.

I must say also that I take great umbrage in your comment about my colleague. He has been quite attentive to his legislative duties. He has been around here for 6 years, and I think that comment was practically inexcusable in view of the fact that he was just here and left.

We are at a period of 1:15 waiting for lunch. It is breakfast for me, since I just flew in from Alaska. As a practical matter, my colleague has duties on the floor, and I thought the comments you made concerning him just after he left were inexcusable.

Senator HART. Would you yield on that?

If I had thought the record indicated that Mr. Nader was criticizing Senator Griffin's absence, I would have interjected, too. I disagree with Senator Stevens.

Senator STEVENS. He has been on this committee since 1966, and I don't understand your comment.

Mr. NADER. It was a comment directed to all the hearings held. He wasn't here for a lot of the hearings.

Senator STEVENS. I am not here for all the hearings either. I have three other committees and 16 other subcommittees. The trouble is that it gives the impression to his constituents that he is neglecting his duties, which you know is not true.

Mr. NADER. It just states a fact, Senator. There was no attempt to say that he could be in six places at one time.

Senator STEVENS. That again reflects the total caliber of your statement, Mr. Nader. You look for the worst in people and not for what is good in this country.

Mr. NADER. Let me say first you are wrong on the law. All imports have to be geared to the same standards that domestic products have to be geared for. My stand on foreign imports is so repetitive and clear there is no point in going through it here when they only represent about 10 percent of vehicles sold and the rest of the imports are American produced vehicles imported.

My statements on the Volkswagen have been laid before this committee again and again, as being the most dangerous car in significant numbers on the American highways. If I were to say the reason you made that statement is because at the time I was testifying you weren't here, that is a statement of fact.

Senator STEVENS. It is true.

Mr. NADER. It is not a statement that you were neglecting your duties. I was just trying to say that if Senator Griffin had the opportunity to absorb the full thrust of the testimony as some Senators had—they are chairmen of the subcommittee, so they have to be here—then it would be different.

I think you can compare Senator Griffin and Senator Hartke on that basis. Senator Hartke sat through many hours of hearings.

Senator STEVENS. The great freedom that you apparently seem to have is to occupy your total time with one subject when the rest of the world seems to be dealing with the total problems of living. The Senators on this committee happen to be dealing with three or four other committees. I accept your comment about the Volkswagen. I am happy to hear it. But an important fact still remains which you neglected to mention in your statement. The fact is that you are not giving credit to the American industry where it is due for the progress that has been made.

Mr. NADER. Do you give credit to a burglar because he doesn't burglarize 90 percent of the time? What kind of nonsense is that? We are talking about pathology here. We are not talking about the fact that a car can go from New York to Los Angeles without losing its transmission. We are talking about documented fraud, about the kinds

of things that Senator Hart has been documenting year after year, billions of dollars.

Senator STEVENS. There are 51 jurisdictions in this country, 50 States and the Federal Government. If you have proof of documented fraud, you should take it to the grand juries throughout this country and the Federal grand juries in every State and get indictments. By coming in here and indicating the industry before a committee without facts and without proof, you are committing what you say they are.

Mr. NADER. That is not true. Do you want me to read the 18 volumes before this committee and the Senate Antitrust Committee? What do you call them? Do you want me to reproduce them in full? The facts are overwhelming. The bumpers on an Impala rear ended at 5 miles per hour results in \$440 damage. What kind of utter nonsense and outrage is that?

Senator STEVENS. You are a lawyer and I am a lawyer. You equate that with criminal fraud. Take it to a grand jury if you can, but don't take it to a congressional committee.

Mr. NADER. You find me a district attorney with the guts to do that. I am looking for legislators with the guts to do that.

Senator STEVENS. What do you want us to do?

Mr. NADER. I want you to make this a criminal penalty in here. If you can penalize some John Doe in this no-fault insurance bill.

Senator STEVENS. There are criminal fraud penalties today in the Federal laws and in the State laws. If you can prove criminal fraud on any commodity, you can take it to a grand jury.

Mr. NADER. There is absolutely no criminal penalty under the Motor Vehicle Safety Act for the corporations in the auto industry who willfully and knowingly violate the safety standards. That was taken out and clear legislative history showed that.

Senator STEVENS. That is a lot different than what you indicated in your statement where you speak of the criminal fraud or criminal negligence in the design of motor vehicles. If you can prove that somebody has committed a criminal fraud in the design of motor vehicles, you can take it into court the same as you can a toaster. You and I know it.

Mr. NADER. Tell me how.

Senator STEVENS. I happen to agree with you on many of the things you say but you destroy the concept of being able to achieve progress by refusing to recognize it.

Mr. NADER. It is time, Senator, to recognize that the major safety features put in automobiles went in in 1967 and 1968, and there has hardly been a whit of progress since then, when there should have been even more progress. It has almost come to an entire standstill. And bumper design has produced more property damage than even before.

Senator STEVENS. Some time you and I ought to sit down and talk about it.

Mr. NADER. I wish your late law partner was here to give some of the evidence that he adduced in his own litigation.

Senator STEVENS. Thank you for mentioning him and I am happy to see you recognize him. He was a brilliant man and he died prematurely. I thought a great deal of him.

As a practical matter, he would agree with me about the concept of being positive as opposed to being negative in order to achieve progress.

Mr. NADER. The companies are positive enough with \$500 million worth of ads. We are giving a critique here. We are dealing with the evidence necessary to pass the bill. If you want me to say that a car today will go from coast to coast at a higher frequency without losing its transmission than 35 years ago, I will say it. It is true.

But the point is we are dealing with the frauds, the defects, the safety hazards. That is what we are dealing with before this committee.

Senator STEVENS. Thank you, Mr. Chairman.

Senator HART. Until 15 minutes ago, I regretted we hadn't concluded earlier. But the last 15 minutes have awakened us all.

Senator STEVENS. It is because I haven't had breakfast, Mr. Chairman.

Senator HART. Let me make a statement. I don't know what my attitude will be with respect to certain of the matters you raised if I was from Idaho or Wyoming. I know that about myself. But I have attempted to do what I feel should be done, and I will match my track record with the rest of them.

Mr. NADER. You certainly can, Senator.

Senator HART. Mr. Sutcliffe.

Mr. SUTCLIFFE. Mr. Nader, in your prepared statement you asked that the legislation S. 976 set Federal rates to mandate reduction for any savings that are accomplished by mandatory property loss reduction standards. Would you comment upon that in light of the present rate regulation structure at the State level?

Are you asking us to overturn the McCarran-Ferguson Act to some extent and regulate insurance rates at the Federal level?

Mr. NADER. Yes; particularly when they deal with vehicle design, because the same reason that supported the Federal Government having one national design for motor vehicle safety follows through here quite logically.

Mr. SUTCLIFFE. Do you see a beneficial impact upon vehicle design, both in property loss reduction characteristics and auto safety characteristics if the premium costs are assessed on an individual basis on a first-party no-fault program as opposed to a liability no-fault combination?

Mr. NADER. I really would like to see that actually occur before being able to comment on it for the following reason, that the insurance companies can make the same kinds of calculations under the third-party system as they do under the first. Unless you get an insurance company that only insures one line of vehicles, that would only insure 1970 Pontiacs—

Mr. SUTCLIFFE. Let me bring it down to a more specific level. Apparently consumer choice to some extent governs the purchase of the different models of vehicles. You have pointed out the limitations of consumer choice in the present automobile population. Supposing an automobile population that had consumer choice differentials as to property loss reduction standards and bodily injury characteristics, would the indicators to the consuming public by way of the premium dollar be larger and more pronounced under a first-party system of insurance rather than under a combination liability first-party coverage?

In other words, do you or do you not agree with Professor Loescher's testimony in the House concerning the impact of no-fault upon automobile design characteristics?

Mr. NADER. I really don't see any evidence to indicate that it would be less under first-party.

Mr. SUTCLIFFE. Would the indicator be more? Would the premium reduction be more?

Mr. NADER. No; I am talking about the premium, no. There is no indication that it would be cheaper in fact on that basis, unless there is an additional stimulus, because you see the insurance companies can do the same thing now that they would be able to do under the first party. They have got roughly the same universe of vehicles, the same actuarial calculations can be made. So there has to be an additional impulse somehow 'o make his prediction more supportable.

I don't see it going in the natural order of things.

Mr. SUTCLIFFE. But do you see any differentials between vehicles being greater as to the insurance prices under a first-party system than under a third-party/first-party combination as we presently have?

Mr. NADER. You mean quite apart from the rating of vehicles?

Mr. SUTCLIFFE. You have postulated Federal rate regulation that would mandate a reflection of savings in the insurance premium dollar. Therefore, there would be come rate differential that the consumer could be told about between car "A" and car "B".

Under a first-party liability system, that rate differential would be on the order of three times the magnitude under the present system according to Professor Loescher's testimony. If that were the case, it would seem that the market system would generate more consumer choice toward those vehicles which were safer and which produced less property damage.

I am simply asking you whether or not you agree with that analysis?

Mr. NADER. If you accept his assumption, definitely. In other words, there is a very elastic response to different insurance rates on the part of the consumer. I think the high horse-powered engine situation which Mr. Nevin referred to is an example of that.

Mr. SUTCLIFFE. But other than that—

Mr. NADER. Other than that, I really can't say.

Mr. SUTCLIFFE. You have made no analysis of the impact of reform efforts upon your desires to produce safer cars or cars less susceptible to damage?

Mr. NADER. No impact whether they would really do as predicted that they would as focused on their vehicles under the first-party system, because it is their vehicle rather than a third party.

Mr. SUTCLIFFE. You have no other comments to make about a change in the reparations system relative to the distribution of money to those people that are injured, you make no statement in support of or in opposition to the concept of no-fault automobile insurance?

Mr. NADER. First of all, I am not going to comment on the bill because I haven't studied it carefully. In principle, I am in favor of the Government yardstick; I am in favor of compensation for pain and suffering; I am in favor of alternative option for the injured plaintiff, if he doesn't want to go under the no-fault system. And under those conditions, a no-fault system, although you have to say what kind of no-fault system, then a no-fault system principle would be advisable given all those conditions. There are so many no-fault plans now ranging from Massachusetts to the various group pro-

posals throughout the States and the Congress that we would have to have a more full study.

Mr. SUTCLIFFE. Thank you, Mr. Chairman.

Senator HART. Give it a little more study, because I have an instinctive feeling that you will come out in the direction I think will be helpful.

Mr. NADER. I must say that the issue, Senator, raised by Senator Stevens is really quite significant, dealing with criminal fraud. I think anybody who knows about the way State attorney generals operate, you have to virtually give them the entire case before they may move in terms of the evidence. That is why it is so critical for this bill and other bills to give the Government information procurement powers from the industry.

If we knew about the Corvair carbon monoxide situation when we should have back in the early sixties, there wouldn't be over a million people today going into their Corvairs breathing levels up to 200 or 300 part per million, as the test will reveal in about a week or two, and it is a colorless, odorless, and tasteless gas. Complaints by motorists in the hundreds to General Motors received back a form letter saying their engine is not in tune or their oil is too dirty, and this has been going on for years, even though General Motors has settled some of these cases for very substantial sums out of court, and there is evidence that top management knew about the defect in 1961, documented evidence, and all this will come out, but the point is no citizen could possibly get a hold of this material and give it to a State attorney general, even if the State attorney general is the one out a hundred who will move against the auto industry. That is why critical to all of this is the twin program of effective sanctions and effective disclosure of detailed information.

Really, it is amazing to hear Ford Motor Co. say bumpers will cost another \$100 without being required to lay it out in detail. I think if the committee's staff look at the Ford Motor Co.'s cost data, the first time auto company cost data has ever been made available in public which was included in the Senate Small Business hearing in 1968, that they will see the enormous productive efficiencies in that industry, and how things cost so much less than the auto companies say it cost.

Senator HART. On that one point of bumper cost, I am advised by staff that on tomorrow the committee will receive information that should be informative and helpful.

Mr. NADER. Just another additional point, Senator. General Motors and other companies have stated all the changes they have to make in a car when they make a stronger bumper. There is a kind of radiating consequence back to the various parts of the car. What they are really saying is over the years they have premised all of these parts and structures on the basis of a fragile, worthless bumper, which generates great sales in the aftermarket for them.

Now that we are being urged to require to put bumpers on the cars, they are going to transfer all the costs of shifting around these features. My point is, if it is really conscious, deliberate avoidance of protective systems and the fraud that it is, then the cost of that should be absorbed by the company. It is bad enough that billions of dollars have been leached out of consumer, which will never be returned to the con-

sumers—it is bad enough that we can't look to the past for consumer reimbursement, we have to look to the future only, without saying because of this anticipation the companies have to transfer all the costs on to the consumer.

Senator HART. Mr. Nader, thank you very much.

We recess hopefully to resume at 2:30.

(The following information was subsequently received for the record:)

MOTORS INSURANCE CORP.,  
767 Fifth Avenue,  
New York, N.Y.

HON. TED STEVENS,  
U.S. Senate,  
Washington, D.C.

DEAR SENATOR STEVENS: In response to your expression of interest, I would like to review the facts concerning MIC's insurance of Corvettes.

Prior to your colloquy with Ralph Nader during the May 10 hearing of the Senate Commerce Committee, he said in part: "GM's Motors Insurance Company dislikes its parent company's Corvette." This was part of a statement that he made urging the Committee to elicit information of this type from car manufacturers. We can only assume that Mr. Nader was not adequately informed on this point or misunderstands what MIC actually does. In short, MIC does insure Corvettes against physical damage, contrary to the implication.

In applying its underwriting policies MIC *makes no distinction by make or model* as to whether a qualified driver may be insured, regardless of what type of GM vehicle he wishes to insure. However, as a matter of normal insurance practice, MIC does take into consideration the same standards that are used generally by the industry when drivers of high performance cars are insured.

It should be understood that MIC and its subsidiary, the CIM Insurance Corporation, write only automobile physical damage insurance, including fire, theft (comprehensive) and collision, primarily with respect to automobiles sold by GM dealers. They do not write liability insurance.

Our underwriting objective is to provide insurance for every qualified applicant who is licensed to operate a motor vehicle, provided he does not have an unreasonably poor record of accidents and violations. To meet this objective, MIC has a broad range of classifications designed to accommodate essentially every risk, except the very worst.

If we can be of further assistance in clarifying other matters concerning MIC physical damage insurance coverage, please let me know. Thank you for this opportunity to correct this mis-statement of MIC's attitude toward providing physical damage insurance on Corvettes.

Sincerely,

FRANK A. MINGLE.

#### AFTERNOON SESSION

Senator GRIFFIN (presiding). The committee will be in order. The subcommittee would be pleased to hear now from Mr. Mack W. Worden, of General Motors, and if you will come forward, Mr. Worden, and introduce those who are with you.

#### STATEMENT OF MACK W. WORDEN, VICE PRESIDENT, MARKETING STAFF, GENERAL MOTORS CORP.; ACCOMPANIED BY J. R. DOIDGE, ENGINEERING STAFF; AND C. R. SHARP, LEGAL STAFF

Mr. WORDEN. Mr. Chairman, I realize this has been a long day. I can read the complete statement or I can summarize the statement. It has been submitted to the committee. As the chairman would wish.

Senator GRIFFIN. Well, I will leave the decision to you, Mr. Worden.

We will be glad to accommodate you in any manner you wish. If you would like to summarize, that would be fine.

Mr. WORDEN. Then if it be my decision, I think I should read into the record the entire statement.

Senator GRIFFIN. Will you introduce those whose are with you?

Mr. WORDEN. I will do so in the course of my statement. Mr. Chairman, and members of the staff of the Senate Commerce Committee, this statement is submitted by General Motors Corp. in response to your invitation to present our comments on S. 976, the Motor Vehicle Information and Cost Savings Act.

I am Mack W. Worden, vice president in charge of the General Motors marketing staff. With me, on my left, J. R. Doidge, of the engineering staff, and on my right, Mr. C. R. Sharp of the legal staff.

The principal intent of this legislation, as we understand it, is to provide a means for reducing motor vehicle repair costs to the owner—whether these costs are incurred by him directly in repair costs, or indirectly as they may be reflected in insurance premiums he pays.

An equally important purpose of the bill is to achieve this objective at no sacrifice in safety or occupant protection. As stated in section 125(b), property loss reduction standards must be compatible with safety standards issued to protect motor vehicle occupants.

We should also point out the possibility always exists that repair costs may be influenced by the addition of certain safety-related components. Thus, while the two objectives will be compatible in many instances, there may be circumstances under which they will not be.

We are in agreement with the sponsors of this legislation on the basic premise—the desirability of lowering the cost to car owners of vehicle repairs and collision insurance. We have a great motivation to reduce in any way possible the overall cost of our products to the consumer, because higher costs would tend to erode our business.

Moreover, lest anyone misread the seriousness of our concern, we do not regard auto insurance as merely an incidental expense to car ownership. Indeed, funds spent for insurance or repair are part of a car owner's total budget set aside for automobile transportation, which must compete directly with other major necessities for the consumer dollar. We fully recognize that the more a car owner must spend for insurance and repairs, the less he has to spend for the car itself.

As to the significant issues posed by the bill, we are in complete accord with some of these, and with others we agree in terms of the goal but not in the method of achieving it.

As to one of the major concepts of the bill, repairability rating, we will propose an alternative program that, in our judgment would be more practicable than the procedures in sections 126 and 127.

We propose now to discuss in sequence the major provisions of the legislation.

First, the redefinition of the term "passenger car." At the outset, the bill changes and adds several definitions to the National Traffic and Motor Vehicle Safety Act of 1966, or the Safety Act. Of major significance is the addition to the Safety Act of a new definition of "passenger motor vehicle." In effect, this would negate the National Highway Traffic Safety Administration's (NHTSA) administrative regulation defining "passenger car." The present definition distinguishes differences among passenger cars, multipurpose passenger vehicles and buses. These distinctions would be eliminated by the S. 976 definition.

There are 44 existing Federal motor vehicle safety standards and regulations, and even more proposals now pending for comment. Additionally, various items of safety equipment and vehicles now in various stages of design, development, and production are affected by the distinctions among types of vehicles established in the regulations.

By retaining the present NHTSA definitions of vehicle classes, confusion as to application of current standards and the administrative burden of resolving this confusion would be avoided. Revising existing standards to conform to the S. 976 definition would be an extremely cumbersome process.

Now as to redefinition of motor vehicle safety. S 976 would change the definition of "motor vehicle safety" in the Safety Act by placing property damage, or "unnecessary damage to motor vehicles," on an equal statutory footing with "risk of death or injury to persons."

The definition of "motor vehicle safety" is basic to the Safety Act. It defines the scope and purpose of the Federal Government's activities in this area. On the other hand, property loss reduction is an entirely different objective, with separate design requirements.

It is important not to dilute the urgency and emphasis now given to safety. As presently drafted, sections 1 through 4 of S. 976 seemingly equate occupant safety with property loss reduction, whereas sections 5 through 15 deal almost entirely with property loss reduction.

We believe this latter approach should be followed throughout the bill.

Now as to rating for damageability and repairability. Designing vehicles with greater resistance to damage is only one consideration that a manufacturer must take into account in meeting the requirements of customers and the public interest.

Others include safety, reliability, durability, emissions, performance, comfort, convenience, appearance and very importantly, the lowest overall cost of car ownership—including both economy of operation and initial cost to the consumer.

Designing simply for low repair costs will not necessarily contribute to the lowest overall cost of car ownership or the highest value product. Designs that would potentially reduce repair costs are not necessarily compatible with efficient manufacturing designs. Manufacturing efficiency has an important bearing on the original price of the car to the consumer.

For example, the welding of certain body components into a single unit—the rear quarter panel, and the adjacent sheet metal and substructure for instance—is less costly to produce, and is structurally stronger.

Moreover, welding this assembly to the body results in a stronger total structure.

These substantial advantages are reflected in the cost of car ownership to the consumer. However, the cost of repairing or replacing this single component could exceed that of a rear quarter body structure consisting of several serviceable sections that may be bolted to the body.

Thus, while we support the rating of vehicles on the basis of damage susceptibility and subsequent repair costs, this could offset the cost savings objective of this bill.

We are concerned, too, that any rating procedure provide some type of credit for safety-related items. Such features would reduce injury to passengers, but some could increase accident repair costs.

Some of these important safety features add to the complexity of vehicles, and, therefore, their potential damage repair costs.

Thus, S. 976 could penalize rather than reward a competitive manufacturer who is a leader in safety innovation, with the result of discouraging voluntary safety improvement.

An finally, we recommend that the proposed testing of predistribution production models not be required. Later in our statement, we will offer for your consideration an alternative rating system.

As to predistribution testing, the testing provisions of section 126 of the bill raise several important questions. For example, (1) When must tests be conducted? (2) How many tests must a manufacturer conduct? (3) What procedures will control the tests?

First, when to test? The key problem in this area is use of "production models," as required by section 126(b)(1). A manufacturer would have to run tests very late in the period just before new model announcement dates—between August 15 and September 15—when dealers all over the country are acquiring new car inventories and are beginning to sell cars. The testing and reporting program envisioned would be practically impossible to accomplish within the probable time period allocated.

Second, how many tests? Presumably, a number of different tests would have to be run at the required 5, 10, and 15 miles per hour to assess the repairability potential of each car in various accident situations. The Secretary might want to test for impacts to the front, rear, side, front corner, and rear corner in order to assure meaningful information for the public.

This could mean 15 tests per model. The numbers could be proportionately larger should the Secretary decide, as the bill allows, to test at higher speeds.

Optional equipment, such as air conditioning, might require additional tests, as different repair factors would be involved.

Third, how to run the test. In addition to the problems discussed above, which bear importantly on the way tests are conducted, there is the difficult problem of standardizing on the scientific criteria for car-to-car impacts. These would be essential to provide data representative of the real world of accident experience.

There is also the difficulty of defining such terms as "normal speeds" and "normal operating conditions," as prescribed in section 125 (a) and (d) (1).

With the number of variables possible in real life accident situations, it is difficult to conceive how a test could be devised which would not be as misrepresentative of accidents that regularly can and do happen as it would be representative of others.

Moreover, the need for subjective judgments of test results introduces a further element of difficulty. Human evaluation will have to say whether the part should be repaired or replaced, how much labor time would be involved and at what labor rate per hour.

Here is an alternate rating proposal.

As suggested earlier, we believe a rating index can be developed which realistically reflects both a vehicle's vulnerability to damage

and its cost to repair. It would at the same time avoid the unmanageable problems of extensive predistribution testing.

We say realistically because it would rely heavily on actual—real world—accident data.

In the course of evolving this system, we examined the structure of other rating systems, including the Folksam system. This system was discussed by representatives of Folksam Insurance Group of Sweden in testimony before the Senate Antitrust and Monopoly Subcommittee in 1969.

Briefly, we propose a rating index number for each make and model. This would be computed by comparing actual accident claims on the vehicle being rated to the average of all claims for vehicles of a similar class, based on previous years' models.

When a new model or design feature is to be introduced, an estimated index number would be developed. This would be based on the new model's parts and replacement labor costs for certain frequently damaged parts. The estimated index for the new model would be modified to a permanent index as actual accident data become available.

It is proposed that essential data on all makes and models would be provided to a rating board for tabulation and publication.

The system could also provide a method for allowing a rating offset for the voluntary installation of safety and antitheft devices which, while providing increased protection, could also increase repair costs.

We believe the concept can be developed into an equitable system for all concerned. General Motors is prepared to work with any and all interested parties in developing the system further, and in aiding in its implementation.

We would be pleased to have our staff people who have studied this proposed rating system set a date to discuss it with your staff in greater detail if you wish.

Now as to bumper requirements. On April 14, the Department of Transportation issued Federal Motor Vehicle Safety Standard No. 215. This new standard requires that, beginning September 1, 1972, passenger car front bumpers be capable of withstanding a 5-mile-per-hour impact into a fixed barrier and rear bumpers, 2½-mile-per-hour barrier impact, without damage to the car's safety related systems.

May I add that the barrier impact of 5 miles per hour in the front is equal to a 10-mile-per-hour car-to-car impact, and the 2½-mile-per-hour barrier impact in the rear is equal to a 5-mile-per-hour car-to-car impact.

All 1973 model General Motors passenger cars have been designed and will be built to meet this portion of the standard, and the majority of models will go beyond these requirements.

Motor vehicle safety standard No. 215 additionally prescribes new bumper regulations to take effect 1 year later. In addition to the fixed barrier test, after September 1, 1973, front bumpers would be required to withstand 5-mile-per-hour impacts and rear bumpers 4-mile-per-hour impacts from several directions, using a pendulum device.

This change in the standard, along with bumper height requirements, would require another sequence of redesign and retooling of the bumper system—not merely of the bumpers themselves, but, more importantly, of their supporting structures as well.

In the property loss reduction standards proposed in S. 976, yet another modification in bumper standards would become effective just 15 months later.

Thus, the industry faces the possibility of a sequence of extensive changes in rear bumper systems. Any change in the level of bumper protection is a complex matter. This is not just a matter of installing a different strip of steel for the bumper face bar. We have to take into account bumper height and many other things that go into bumper systems.

Meeting these standards may require increasing the length of the car in the rear and providing additional clearance for energy-absorber displacement. This could involve redesigning and retooling of the bumper, new shock absorber units, revised rear quarter panels, rear body panels, deck lids, and trunk floor panels.

Additionally, the gasoline tank filler neck access and some tail lamps would have to be moved in some models. Trunk capacity may be reduced because of the location of absorber units.

Because the standard for rear bumper systems proposed in this legislation involves many complex matters of design, engineering detail, and leadtime, administrative discretion, in our judgment, would be the best means of assuring optimum cost-benefit to the consumer in setting standards.

Therefore, we urge that the Secretary be authorized to prescribe standards, if needed, on an administrative basis.

In keeping with our earlier recommendation, we again urge that any bumper standards be applied to passenger motor vehicles as they are presently defined by the National Highway Traffic Safety Administration. In this connection, we wish to point out that the property loss reduction standard set forth in section 125(c) relating to bumpers in this bill embraces all motor vehicles.

Now as to motor vehicle inspection, and registrations which pertain to title V in the bill. General Motors has consistently supported periodic motor vehicle inspection (PMVI) as an important element in a complete traffic safety program.

In 1954, the Automobile Manufacturers Association, of which GM is a member, adopted a policy favoring periodic motor vehicle safety inspection. That policy has been reaffirmed by AMA many times since 1954, the most recent being less than 3 weeks ago at the National Symposium on Diagnostic Vehicle Inspection. On February 8, 1966, James M. Roche, now chairman of General Motors, endorsed PMVI in a speech to the Automotive Service Industries Association convention in New York City.

A description of the GM position on periodic inspection appears in some detail in part 3 of the record of hearings on the automotive repair industry held by the Senate Subcommittee on Antitrust and Monopoly. We will be pleased to submit a copy of this testimony, if you wish, for the record of this hearing.

S. 976 would require that highway safety program standard No. 1 be amended to provide for additional inspection whenever the title to the vehicle is transferred for purposes other than resale. Inspection would also be required when damage repairs are made on safety-related parts.

We believe the expanded inspection provisions of this bill need to be examined to determine whether in fact a cost benefit would accrue

to the consumer. For example, a single car might have to go through inspection in 3 consecutive months because of the mechanics of this inspection provision. In January, it might go through postdamage repair inspection, in February, periodic motor vehicle inspection, and in March, a transfer inspection. Such a series of inspections would be costly to the consumer. In our judgment, a good PMVI program would suffice.

As to uniform State programs on registrations and titling—General Motors has supported—and continues to support—uniform State registrations and titling requirements of S. 976 that are similar to those published by the National Committee on Uniform Traffic Laws and Ordinances.

As to Federal funds for inspection and titling—finally, the bill provides that funds from the highway trust fund could be used to partially finance the State programs for motor vehicle inspection and titling.

General Motors does not oppose this. The Federal Aid Highway Act of 1970 already provides for this financing.

In summary, two of the very important areas in which we have been working—and will continue to work—are: first, in designing and building cars so they require less repair and service, and second, to make it easier to perform repairs and service when they are required.

As we have pointed out, all our 1973 model cars will meet the 1973 bumper standards, and most of them will go beyond those standards. Our forward design program is directed toward making our cars less vulnerable to crash damage, and easier to repair if damaged.

In order to manufacture cars that require less service, we are designing and building greater durability and reduced maintenance requirements into our products. For example, you no longer hear of cars needing cylinder reboring or complete engine overhaul and we have longer tire life.

Also, intervals between chassis lubrication and engine oil changes have been extended.

To make servicing easier when it is required, a GM service research group is working on development and improvement of diagnostic and repair techniques, as well as the equipment used in making these repairs.

Improved techniques are widely disseminated to those who make repairs. Improvements in existing equipment, or ideas for new equipment, are made readily available to the equipment manufacturers.

In closing, we would like to restate two principal points of our presentation:

1. Repairability rating: We agree that repair costs must be reduced, and that property loss reduction standards and a repairability rating may be helpful in achieving this objective. However, we believe that a rating system closely geared to actual accident experience, as opposed to simulated impacts, is more workable than the predistribution tests proposed in S. 976.

2. Bumper standards: Establishing any level of bumper protection is a complex matter involving a substantial number of component changes and design modifications. The Secretary of Transportation should be empowered to issue bumper regulations providing optimum cost-benefits to the customer—in terms of both new system costs and potential insurance premium savings.

This concludes our prepared statement on S. 976. Thank you for your kind attention.

Senator GRIFFIN. Thank you, Mr. Worden. First of all, I want to indicate for the record that I think that, on the whole, your statement is a positive statement which I know the committee appreciates.

As a spokesman for General Motors, you make it clear that the corporation supports in principle most of the objectives of this legislation, if not the details.

You have not just opposed certain provisions. You have advanced some positive alternatives, and I am sure that those are going to be useful to the committee in its deliberations.

In connection with your proposed rating system which would compare the damageability of various makes of cars, based on the actual claims statistics rather than the testing system suggested in the legislation, it occurs to me that it might be more likely to reduce insurance premiums since the statistics would be similar to those actually used by insurance companies to determine their rates.

In other words, that the consumer would be better off. Is that your contention?

Mr. WORDEN. Yes, sir.

Senator GRIFFIN. How long do you think it would take to put a system such as you propose into effect?

Mr. WORDEN. Sir, that would be pure guesswork on my part. As I suggested in the statement, all of the details have not been worked out. We believe it would be feasible and if the chairman would like, we will get, this afternoon if possible, or set a date to get with your committee to work out the details of such a system.

And it would be pure guesswork on my part, but this requires the submission of all the information from the various sources, basically insurance companies, of the type of information that is required.

I would not care to guess, but it would seem to me that somewhere in the neighborhood of 12 to 18 months, or 2 years, a system could be operable, such as that proposed.

Senator GRIFFIN. Now I know that the majority counsel, Mr. Sutcliffe, has some questions to ask on behalf of Senator Hart and others, but before I turn to him, I wonder if the distinguished Senator from Alaska has any questions?

Senator STEVENS. Yes; I am sorry to come in late. I am interested in the concept of this predistribution testing, and what relationship it has to availability of jobs.

Have you made any study of that in terms of section 126? How much delay would there be built into production, and how many people would be put out of work for how long if we went into this kind of a testing?

Mr. WORDEN. Sir, I hate to answer a question by asking one, but it would all depend upon how much testing was required by the Secretary.

As it is in the bill, it's at 5, 10, and 15 miles per hour. But if he moved completely around the car, the two front corners, two rear corners, and at various impact stages, and then if you had to go to each make and model within the General Motors line, for instance, or within the industry where there are some 345 different domestic makes, and 200 foreign makes, or some 545 different cars, and then if I had to go in and add the options which require different repairability—you are moving into a multitude of testing that there just would be an inadequate amount of time.

And all the time that you are doing this testing, your production lines are presumably running, you know, during this particular time, and people are at work.

Contrary to that, if you were to fully meet what—and maybe this is not the total intent of the bill—but if you were to meet the requirements as we interpret the intent of the bill, you would have to run your production lines to get enough production models to run tests and have these tests concluded in an adequate time in order to have all of this information into the field and in the dealers' hands before you could announce your new product or allow the dealers to announce the new product—before you can even distribute the new product to the dealers.

Senator STEVENS. Has that been analyzed at all in terms of if you had to do that?

Mr. WORDEN. Not in that great a detail; no, sir. We believe it an unmanageable proposal, and that is the reason we tried to come forward with what we believe to be a positive alternative proposal.

Senator STEVENS. Maybe I am showing my ignorance on this subject, but isn't it possible to develop a modular system of tests for an existing model and then test the additions to each subsequent model without having to test each model each year for each provision, for each speed?

Mr. WORDEN. Sir, I am not a mathematician. I have an engineer right here. But I am confident this could be done, and having read some of the previous testimony, of the representative from the Cornell Aeronautical Institute, they have proposed that a mathematical modeling concept might well be applied where this could be done.

But again, we are speaking of duplicating impact tests, car to car impact tests, on a simulated basis, rather than the real life world situation that actually occurs. We believe the real life world situation and the data that would be accumulated on which ratings would be based, would be more realistic and in the long run be of much greater benefit to the consumer.

Senator STEVENS. Thank you very much. Thank you, Mr. Chairman.

Senator GRIFFIN. It would mean more in terms of insurance rates?

Mr. WORDEN. Yes, sir. Not more costs, sir.

Senator GRIFFIN. That's right, but it would mean more to the insurance companies in terms of determining insurance rates.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Thank you, Senator Griffin. Mr. Worden, you referred to Mr. Miller's experimental work at Cornell Aeronautics Laboratories, where they have had initial success in developing a computer model to depict vehicle defamination at different impact speeds.

If this type of rating were possible, a rating not requiring the crash testing of individual vehicles but one based upon a computer model, would this reduce considerably the problems you have with the testing of production models?

Mr. WORDEN. I would think so; yes, sir.

Mr. SUTCLIFFE. So that the requirement of the bill which asks the Secretary to come up with reasonable test methods might include test methods along the lines of a computer model that wouldn't necessitate the bending up of a lot of sheet metal?

Mr. WORDEN. So long, sir, as the bill says production models. As you know, you have pilot line models and then you have production

models. We are building the cars. These are the cars that are going to be shipped to dealers, which are going to be sold to the public.

This is the delay factor that is involved. Now if there could be a step at some point and if the modeling and the testing mathematically could be computed early enough, like you take the first sample—and I'll put in a commercial—take the first Impala Chevrolet right off the line, and that could be tested and then through mathematics and applied to all Chevrolets. Then it would not interfere, in my judgment, with the proposal in S. 976.

Mr. SUTCLIFFE. Are you suggesting that perhaps the Secretary be given discretion as to whether the tests should apply to the pilot line models or production vehicles?

Mr. WORDEN. Yes, sir.

Mr. SUTCLIFFE. Thank you.

In your testimony, you say, "Thus, while we support the rating of vehicles on the basis of damage susceptibility and subsequent repair costs, this could offset the cost savings objectives of the bill."

Now by this do you mean that it is possible that bumpers would cost more than the resulting savings from insurance premium reductions?

Mr. WORDEN. What we are referring to in dealing with damage susceptibility and subsequent repair costs that could offset the cost savings objectives of the bill, is not just bumpers alone. It is anything that is added as a component to the benefit of the consumer that might be completely hidden.

For example, we might add a side door guard beam, as we did within the General Motors product line. It is completely hidden. You can't see it. It provides additional protection. It adds, certainly, if the car were to be crashed in the side, it protects the occupants on the inside of the car from protrusion, because the beam helps limit the protrusion into the vehicle.

It adds cost to the vehicle, but as far as looking at the overall rating, you know, you might not get any benefit for having that side guard beam in there.

Yet it's definitely to the benefit of the buyer and user of that product to have it there for his protection.

Mr. SUTCLIFFE. That goes to the point of the need to coordinate safety provisions with property damage.

Mr. WORDEN. Yes, sir.

Mr. SUTCLIFFE. The provisions in S. 976 which ask for the development of a rating as to property damage susceptibility and injury index would be able to reflect both the safety factor of the vehicle and the property loss reduction factor of the vehicle as to insurance premiums, would they not?

In other words, isn't the bill already directed toward the coordination of those criteria?

Mr. WORDEN. I think what I am saying when I refer to sections 1 through 4 is purely a strong, strong support of the Safety Act and the occupant protection. We are not arguing with the property damage additions in 5 through 14. We think that when you put property loss in 1 through 4, you are equating the bending of a piece of metal with some kind of damage to a human body. We do not believe that to be correct.

Mr. SUTCLIFFE. As to the cost benefit of providing property protection, has General Motors done a cost benefit analysis of the impact

speed, the cost of the bumper, and the premium reduction resulting from those various impact speeds on the cost, and premium savings?

Mr. WORDEN. Well, sir; I feel rather confident that General Motors has tested the vehicles in this regard. Now whether or not these have been turned into internal cost factors, you know, I am sure this likewise has been done, as they affect General Motors costs and as they possibly might reflect in the ultimate cost to the consumer.

But General Motors interest has to be, as in the interest of any automotive manufacturer, or any manufacturer, for that matter, the ultimate cost to the consumer.

Mr. SUTCLIFFE. Could you present the findings that have been made as to where the cost benefit lies in the production bumpers?

Mr. WORDEN. I think that we could, making certain assumptions on impact; if you would allow us to make certain assumptions, we could present to you a chart that would show you the reasonableness of the various speeds of impact.

Mr. SUTCLIFFE. I am simply asking for the record to have available those, with an explanation of the assumptions that are made.

Mr. WORDEN. I will be more than happy to check with Detroit to see if that can be supplied to you, sir.

(The following information was subsequently received for the record:)

The primary function of bumper systems is to provide protection during low-speed collisions for body components, lamps, sheet metal, internal mechanical components and structural components. Secondly, the bumper systems should be integrated into the vehicle so as to not detract from the ride, handling performance or parking ability of the vehicle and to coordinate with appearance in terms of marketing potential.

Accordingly, General Motors has undertaken extensive studies to ascertain where the "cost benefit" lies in providing improved crash damage protection with redesigned bumper systems.

These studies included evaluation of alternative designs, levels of impact speeds, frequency of low-speed collisions, the cost of new bumper systems and possible consumer benefits. Early in our studies it was recognized that increased consumer benefits were of primary importance. Since the safety of the occupants is not involved at the low impact speeds being discussed, it is essential to provide some economic return to the consumer for any increased cost outlay due to new bumper systems.

To assist in evaluating different possible bumper systems, their relative estimated prices to the consumer were charted (Chart 1). This chart is not related specifically to design cost, total cost, dealer price or consumer price; it only shows that the relationships of the three speed levels of bumper protection on the chart to each other remain constant regardless of what value level is studied in relation to consumer benefit.

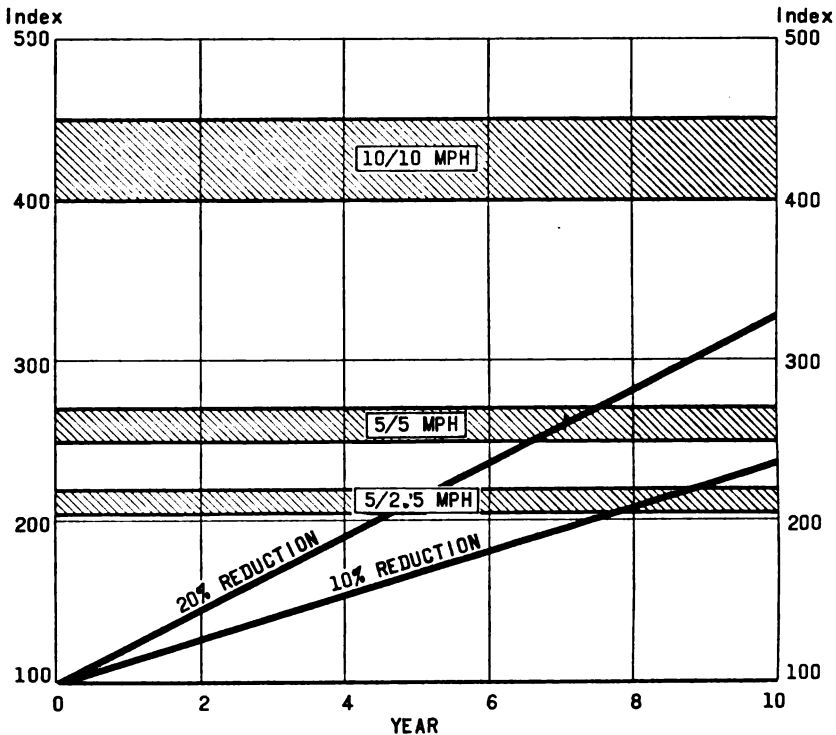

Also, the values indicated for the three levels of bumper protection are independent of the consumer cost of current bumper systems.

The estimated price to the consumer of three different levels of bumper protection is compared to existing bumper protection in terms of index values. The index value comparison is not the same as a percentage comparison, as will be indicated. The index assigned is used only to compare the relative difference between proposed systems.

The 100 index base level represents the estimated consumer price for the existing protection level front and rear. The index value, or implied dollar value, below the 100 index line could represent any value, large or small. It is simply a departure point, with no implied value, to mark the present level of bumper protection, which has no identifiable price to the consumer.

CHART 1

# INITIAL PRICE TO CONSUMER VS. CUMULATIVE POTENTIAL SAVINGS

The term "price to the consumer," as it applies to Chart 1, is an estimated statistical value. A statistical "price to the consumer" is needed to evaluate properly the various bumper systems under investigation. A given feature or system such as a bumper system, is not available to the consumer as an item—nor is it priced separately—because it is integrated into the vehicle. Moreover, the price of the total vehicle must meet the test of a competitive market.

The estimated initial "price to the consumer" we have cited are average ranges and there is a variance in prices related to variances in design. Moreover, we find that the price of some smaller car system designs would often tend to be higher than those for some bigger cars because of vehicle structure. Thus, the greatest economic burden may be placed disproportionately on the segment of car purchasers who generally could least afford to pay.

Moving up the chart, the first band reflects the estimated differential for a 5/2.5 mph system over the existing system.

The next band up represents a 5/5 system, with an estimated price to the consumer that is about 50 index points higher than the 5/2.5 mph bumper system.

And, finally, the top band shows that the consumer would pay more than twice as much for 10/10 mph protection as for the basic 5/2.5 mph capability.

It should not be inferred that the estimated initial price to the consumer of the 5/2.5 mph bumper system would be slightly over twice that of the existing bumper protection indicated by the 100 index line. The 100 index is not measurable in any relative dollar value, as existing bumper protection is integrated into the total price of current GM production cars.

## EFFECT OF INSURANCE REDUCTIONS

The added cost for the improved bumper protection indicated in Chart 1 would be partly offset by lower repair costs and proposed reductions in insurance premiums. Liberty Mutual has indicated a 10% collision premium reduction would be available for cars which can withstand a 5 mph front and rear barrier test with no damage. Allstate has offered a 20% reduction for a system which provides a similar capability. Allstate has said that it will accept that 5/2.5 bumper system that meets 1973 federal standards as a basis for 10% rather than 20% reductions. However, if the 5/2.5 bumper system were accepted as the basis for 20% reductions, the following results might be achieved:

At a 10% reduction in premiums together with the estimated deductible savings, the 5/2.5 system would show a net cumulative potential savings to the consumer sometime after the end of the eighth year, or close to the end of the life of the average car. With only a 10% reduction in premiums, the consumer could not realize any savings with any system more costly than the 5/2.5 system within the average car life.

With a 20% reduction in premiums, the consumer would realize net cumulative potential savings, relative to the initial price sometime during the fifth year with the 5/2.5 system. This would occur sometime during the seventh year with the 5/5 system.

The cost of the 10/10 system would never be recovered during the life of the car at these percentage reductions in premiums. And it is obvious that a person who purchases a new car every year or two would recover only a small part of his added cost for any of the above systems.

Also, it should be noted that most car owners drop their collision coverage after about six or seven years. Therefore, the savings indicated beyond this point would not actually benefit all consumers.

Additionally, only about 50-60% of all car owners insure their vehicles for collision damage. Also, the insurance industry has only indicated reductions in collision premiums and not for property damage premiums. Therefore, a large number of owners would not benefit from reduced insurance premiums.

## STUDY OF REAR PROTECTION LEVEL

We have indicated that there would be a sharply progressive increase in price to the consumer as bumper protection moves up from the existing level of bumper protection to 5/2.5, 5/5 and 10/10 mph front-rear.

Because of this, we endeavored to evaluate in our cost benefit studies the most economical level of bumper protection in the interest of the consumer.

## STUDY OF REAR PROTECTION

We examined insurance and engineering test data in an effort to identify the optimum level of cost benefit to the consumer, and, on the basis of these studies, we believe that it is more beneficial to the consumer to emphasize front-end bumper protection and provide for a slightly lower level of rear bumper protection.

This judgment is based on an extensive review of accident frequency factors shown in insurance claim data and evaluating associated cost trade-offs. As part of our study of this matter, we have made a detailed analysis of 17,000 cases in the Motors Insurance Corporation physical damage accident data file at our Safety Research and Development Laboratory.

The MIC data is the best available, to our knowledge, in the evaluation of automobile accident crash damage. The MIC data has been related to barrier impact speed, which is essential for the evaluation of cost benefits. We do not know of any other insurance industry data which has been similarly correlated.

The MIC data is related to impact speed in the following manner. When an MIC claim involves personal injury, the MIC adjuster is required to prepare a lengthy report of the accident details and submit color photographs. The damage described in the accident report is compared with damage experienced in Proving Ground full scale barrier tests. On this basis, an estimate is made of *equivalent* barrier speed. The comparison considers not only the repair cost but the characteristics and extent of metal deformation.

This makes it possible to establish a mathematical relationship between equivalent barrier speed and repair cost. This relationship is then used to assign an equivalent barrier speed to each reported MIC insured loss.

## FREQUENCY OF ACCIDENT DISTRIBUTION

Our analysis of the MIC data shows that the front area of the car (from the A-pillars forward) is involved in accidents 58% of the time and the rear only 30% (Chart 2).

We then examined the MIC physical damage data to ascertain what could be gained from a practical, improved bumper system that could be made available at a price to the consumer in proportion to the potential benefits.

CHART 2.—ACCIDENT DAMAGE DISTRIBUTION

	Damaged area—Frequency		
	Front (percent)	Rear (percent)	Total (percent)
Distribution of MIC claims:			
Total sample with existing bumpers.....	58	30	88
Revised sample with improved bumper protection.....	35	14	49

This analysis showed that such a bumper system would have reduced the damage in 35% of the claims involving front-end collisions, and in rear-end damage in about 14% of the claims. Most significantly, on the basis of this MIC analysis, bumper-involved front-end crash damage occurs  $2\frac{1}{2}$  times more frequently than rear-end damage.

MIC does not insure for property damage liability, which is the coverage for damage to other than the insured's own car. Therefore, this type of claim is not reflected in the actual MIC data used in the analysis to ascertain the distribution of impacts.

Collision coverage includes payment of any legitimate claim that is made with respect to a damaged, insured car regardless of whether it struck another object or was struck by something else.

The MIC policyholder is entitled to make a claim anytime he is involved in an accident, with the expectation that any claim against the party at fault (third party) will be handled by his collision carrier. Last year MIC recovered 14.5% of their paid collision claim dollars by subrogation proceedings against third parties (people who struck MIC-insured cars).

The MIC data, showing 35% front-end involvement and 14% rear-end involvement, clearly suggest that, in terms of *actual* repair and replacement, the front end of the car requires greater protection than the rear end. We are not alone in this contention (Chart 3).

## CONFIRMING STUDIES

A 1970 study by Cornell Aeronautical Laboratory for the then National Highway Safety Bureau comes to a similar conclusion. The Cornell report showed that front impacts occur in about 67% of all accidents, while rear impacts occur in about 10% of all accidents. Cornell said that even adding rear quarter panel damage incidents increased total rear impacts in their study only to 20%.

Interestingly, in an address by Douglas Toms, administrator of the NHTSB, to the 1970 symposium of the Insurance Institute for Highway Safety, he said: "This is our breakdown where crashes are occurring on the car: 67% in the front, 16% in the rear."

CHART 3.—FRONT VS. REAR IMPACT

	Front (percent)	Rear (percent)
MIC data.....	35	14
Cornell data.....	67	10
NHTSB data.....	67	16

A 1967 Denver Police Department study of 28,830 accidents in a four-county area showed a ratio of 2.1 front impacts to 1.0 rear impacts. This independent study included all passenger cars which impacted another car or object and suffered in excess of \$100 damage.

The accidents least likely to be reported—single car, off-the-road accidents—were also the most likely to involve front ends. The Denver study is completely

independent of insurance data and would appear to confirm the fact that front-to-rear accident ratio exceeds two to one.

Our own production of replacement units for certain front and rear end so-called crash parts also supports the MIC data.

We were asked by the Senate Judiciary Subcommittee on Antitrust and Monopoly in October, 1969, to report on production of six different replacement parts for our 10 best-selling makes and models. The subcommittee asked us to indicate the number of front left and right fenders, hoods, left and right quarter panels and trunk deck lids produced for model year 1969 for sale as replacement parts. We were asked to compare these to the total number of each make and model actually produced.

Our response showed that replacement part production ranged from a high of 5.6% of total production for one front-end part to a low of 1.7% for one rear-end part.

#### PERCENTAGE OF ACCIDENT INVOLVEMENT

National Safety Council statistics show that about 20% of all passenger cars are involved in accidents each year, and MIC insurance claims demonstrate that the majority of these occur at very low speeds. Also, the 20% reported by the National Safety Council includes all types of impacts—front, rear and side.

As noted previously in Chart 2, the improved bumper systems would affect half of MIC's accident claims. The remaining claims would improve impacts in other areas of the care not affected by improved bumper systems.

Therefore, it could be assumed that the National Safety Council's estimate of approximately 20% of all passenger cars being involved in accidents each year would be reduced by half through improved bumper protection.

On this basis, the owners of only 10% of the total car population would benefit from improved bumper protection. This is because that, of the remaining car population, the National Safety Council indicates that 80% are not involved in accidents in any given year. The final 10%, as the MIC data suggests, would be involved in impacts which would not be affected by the improved bumper systems.

**Mr. SUTCLIFFE.** In your testimony, you mention that your 1973 cars surpass the Department of Transportation safety related bumper requirements. In what particulars will your 1973 models surpass that requirement?

**Mr. WORDEN.** May I ask Mr. Doidge to answer that question?

**Mr. DOIDGE.** Most of them will exceed, as we said, and for example, our bumpers are designed to give no sheet metal damage to the car at the 5-mile-an-hour front and 2½-mile-per-hour rear barrier.

The safety law says just safety related items like head lights, fuel systems and all, so we have moved into the damageability part of the thing, unrelated to safety.

In some other areas such as cornering and things like that, we established our corporate position long before there were any safety standards, in response to the things that have gone on.

Does that answer that satisfactorily?

**Mr. SUTCLIFFE.** In other words, they will relate to the property damage aspects as well as the safety aspects?

**Mr. DOIDGE.** Yes, which we think both are important, of course. And that is why we decided to do it, much before the legislation or the direction.

**Mr. SUTCLIFFE.** Thank you very much.

**Senator GRIFFIN.** Anything further, Mr. Stevens?

**Senator STEVENS.** No.

**Senator GRIFFITH.** Mr. Worden, I want to thank you and your associates for presenting the testimony. We appreciate it very much.

**Mr. WORDEN.** Thank you very much.

(The following information was subsequently received for the record:)

## ATTACHMENT A

The amendment seeks to outlaw tampering with original equipment odometers by making it unlawful to advertise, sell, use or install any device which can cause the odometer to register any other than the true mileage driven. It also outlaws altering, resetting or disconnection of odometers or conspiring with others with the intent to reduce the number of miles indicated thereon, as well as operation of a vehicle with the odometer disconnected.

The amendment properly recognizes that the "true" mileage driven is that "registered by the odometer within the manufacturer's designed tolerance." This tolerance is necessary, since conditions which normally change from day to day and from owner to owner, such as air pressure, tire size, amount of tread wear, etc., will in small degree vary the accuracy of an odometer reading.

Actually, passenger cars are equipped with odometers which have a design tolerance of  $\pm 3.75\%$ . Light and heavy truck odometers are designed, in many cases, to even less tolerance in order to offset for additional variables in commercial operation, such as more tire sizes and rear axle options, which would otherwise vary accuracy beyond the minimal tolerance range.

Consistent with the above and in the interest of technical corrections, we would suggest the following amendments:

Page 1, Line 6. Delete "an accurate reflection of" and "actually."

Page 1, Line 7. Delete "an accurate indication of."

Page 2, Line 16. Delete "actual" and insert "within the manufacturer's design tolerance" after the word "distance".

## ATTACHMENT B

These comments are offered in response to the amendment to S. 976 which would require emission inspection of light-duty motor vehicles at least once per year.

General Motors supports the intent of this amendment to S. 976. We have continuously supported the need for annual inspection for motor vehicles as an effective and inexpensive means of assuring the optimum level of emission control for vehicles in use. Tests by General Motors in Southern California indicated that average levels of hydrocarbon and carbon monoxide from vehicles in use could be reduced by 10 percent and 16 percent, respectively, as a result of an effective inspection and adjustment program.<sup>1</sup>

However, although we agree with the intent of the amendment, certain provisions appear to add unnecessary complication and create the possibility of owner dissatisfaction with the program.

A. Section 15(2)(A) requires an annual inspection of light-duty motors vehicles, as well as an inspection at time of transfer of title for purposes other than resale, and after an accident if the emission control systems were damaged. It would seem that an annual inspection should suffice. As pointed out earlier in our response to S. 976, it would avoid duplicate tests within a period of a few months. The effect on the atmosphere of additional inspections at time of transfer, or after vehicle damage, would not be justified in light of the inconvenience and confusion this would cause.

B. Section 15(b) requires that vehicles manufactured prior to model year 1972 be tuned to perform with specifications established in consultation with the Administrator of EPA.

Section 15(c) however, specifies that the emission standards for 1972 and subsequent model year vehicles in use "shall be the same as the standards established under the authority of Section 202 of the Clean Air Act" for new vehicle certification. We believe that the technically complicated job of the determination of field standards for 1972 and subsequent model vehicles should, as provided in the 1970 Clean Air Act, be left to the discretion of the Administrator of the Environmental Protection Agency. Setting such standards by legislative edict is inconsistent with the provisions of the 1970 Clean Air Act just passed by the Congress. A discussion of the setting of these standards is included in a March 12, 1971, document titled, "General Motors Progress and Programs in Automotive Emission Control," pages 75 through 80, previously submitted to the Administrator of the Environmental Protection Agency. This document is included herein by reference.

<sup>1</sup> "Tune-Up Inspection, a Continuing Emission Control," SAE paper 690141.

To summarize, cars in use cannot be expected to perform to the same levels of emission control efficiency as cars tested under proving ground conditions.

Certification vehicles, for example, are operated continuously and accumulate 50,000 miles of operation in approximately four months, using high quality, commercially-available fuels and lubricants.

In actual use, very few cars will experience this same kind of rapid mileage accumulation. Many see only occasional use. Stop-and-go operation with frequent cold starts will increase the chances for dirt and gum accumulation, engine rusting, oil dilution, PCV plugging, spark plug fouling, stuck chokes, poor piston ring seating, exhaust valve leakage, etc. Regular maintenance can minimize the effects of these variables, but may not be totally effective in bringing the emission levels back to the new car condition.

It simply is not possible to simulate the aging, eroding and deteriorating effects of time with a rapid mileage accumulation schedule, and it will be many years after our control systems are actually installed in cars before we have enough valid, long-mileage data on which to make accurate projections of what may be expected of future vehicles in actual customer service.

Under controlled conditions of a proving ground certification program, maintenance is provided on a regular basis, using General Motors replacement parts. Proper maintenance is a vital requirement for satisfactory field performance of emission control equipment as well. However, conditions are not well controlled in the field, and lack of maintenance or improper maintenance and adjustment are common. For example, in a field survey of 152 1970 model General Motors vehicles which exceeded certification levels at mileages of over 4000 miles, 92 percent of the failures were due to rich idle, low idle speed, advanced spark timing or rich choke operation—all items included in any maintenance program.

Furthermore, we feel it will be extremely difficult to diagnose the cause for high emissions from the results of a simple emission measurement as suggested by the amendment. This problem can result in considerable inconvenience and expense to the vehicle owner.

#### RECOMMENDATIONS

As an alternate to the proposed amendment, we recommend the following course of action for field emission inspections:

1. In the absence of accurate methods and procedures for measuring emissions from vehicles in use, an annual inspection should be required for all cars. Inspection would consist of a test and adjustment of the engine operating parameters, and inspection for proper installation of emission control devices, if so equipped.

2. When adequate methods and procedures for measuring emissions for vehicles in use are prescribed, the maximum emission levels for each pollutant should be selected, or the test procedure should be adjusted, to allow for reasonable deterioration in use. A specific recommendation is contained in our March 12 submission to EPA noted earlier.

Senator GRIFFIN. Now the committee will be glad to hear from Sydney L. Terry, vice president of Chrysler Corp. Mr. Terry, we are glad to have you. I would appreciate it if you would introduce your associate and proceed in any way you wish.

#### **STATEMENT OF SYDNEY L. TERRY, VICE PRESIDENT, SAFETY AND EMISSIONS, CHRYSLER CORP.; ACCOMPANIED BY VICTOR TOMLINSON, LEGAL STAFF**

Mr. TERRY. I have with me Victor Tomlinson of our legal staff.

My name is Sydney L. Terry. I am vice president, safety and emissions for Chrysler Corp. I welcome this opportunity to present Chrysler's views on amendments to the National Traffic and Motor Vehicle Safety Act as proposed by S. 976.

We have carefully reviewed and analyzed this proposal and are favorably impressed with its stated goals and objectives. We commend the bill's sponsors for seeking to alleviate some of the problems associated with motor vehicle use and ownership today.

I do not think it appropriate to discuss specific language of the bill. However, I wish to make some general and, I believe, more important observations about the bill as they pertain to the consumer, the motor vehicle manufacturer, and Chrysler in particular.

Let me say at the outset that we at Chrysler believe that the free marketplace is the consumer's best friend. We are confident that the forces generated by competition among car manufacturers for the consumer dollar are by far the most effective means of attaining the stated objectives of this bill. We accept the concept of competition as a means of producing cars less vulnerable to damage.

We are willing to take our chances with public disclosure of comparative automobile insurance and repair costs. We agree with the general concept of mandatory inspection following vehicle accident repairs and ownership change.

And, we support in total this bill's efforts to bring the States into conformity with registration and titling provisions of the Uniform Vehicle Code and Model Traffic Ordinance.

One of the problems this bill seeks to solve is the matter of increasing auto insurance and accident repair costs. This problem also deeply concerns us because it adversely affects the buyers and users of our cars. But we are confident that competition among motor vehicle manufacturers to produce cars less vulnerable to damage would result in lower repair costs to the consumer.

This, of course, is the stated objective of the bill. However, we seriously question the matter which the bill sets forth to encourage such competition.

The bill proposes to encourage competition by regulation. We think this approach is ill-advised and contrary to the public interest. Setting new car property loss reduction standards will not promote competition; rather it will more likely stifle and inhibit competition. Further, we question the feasibility of these proposed requirements.

As to the procedures for determining "susceptibility to damage," it is our opinion that there is likely to be little resemblance between the artificial, standardized, and controlled testing methods to be used by the manufacturer at his proving grounds and run by skilled technicians—a resemblance between that and what happens in the real life situation.

We feel that any repair cost estimate resulting from a prescribed proving ground collision would have no practical connection with a "bump" shop estimate for making repairs following an actual "on street" accident.

Nor would manufacturer repair cost estimates reflect the relative susceptibility of cars to damage resulting from collisions between the various makes and models of one manufacturer, between the various makes and models of competing manufacturers, or between the untold accident combinations that inevitably occur within the total vehicle population across the Nation.

Further, we believe it would be completely impractical to conduct tests on every make and model car, obtain cost estimates of repairs, translate this data into meaningful information, and have it available to the consumer at model introduction time.

It is conceivable that these provisions could require hundreds—perhaps thousands—of tests. For example, Chrysler advertised some 139

car models this year, down from 156 last year. The downward trend is likely to continue in future years.

Nevertheless, considering all combinations of trim, engine, color, equipment options, we could run any one of our assembly plants for more than a year without ever building exactly the same car twice.

Of course, many of these combinations would have no bearing on repair costs, but at the same time, many would.

In view of the possible quantitative aspects of these requirements alone, there simply would not be enough leadtime between the beginning of production and dealer introduction of new vehicles. At Chrysler, our operations are geared to make necessary model change switchovers at our assembly plants beginning in about the middle of July. This process may take several weeks at any given plant before actual production is begun.

Frankly, we have just about all we can do to produce enough cars to fill the pipeline to our dealerships by new car introduction date in early fall. It is during this same period, presumably, that the various tests proposed would need to be conducted. It is also during this same period that the data derived from such tests would need be collected, translated into meaningful information for the consumer and made available to dealers for dissemination to prospective customers at new model introduction time. We feel that this would be a highly impractical task. Moreover, the cost implications for meeting this requirement could be tremendous.

Aside from the matter of leadtime and costs for these tests, there are many situations well known to engineers and designers in which improved serviceability, easier maintenance, or less expensive repairs can be achieved through car design. But most can be achieved only by increasing the cost—the basic cost—of the product.

This means that the effort to reduce consumer repair costs by setting property loss reduction standards would almost inevitably result in increased costs and prices for new cars. But it is well recognized that car design is but one of many factors contributing to rising insurance and repair costs. We at Chrysler do not know just how much of a factor design plays in these rising costs and we regret that we have been unable to obtain such information from any source.

Nevertheless, this matter of increasing vehicle costs is of serious concern to us. We are apprehensive, to say the least, as to how and where will the line be drawn. We fear a continuation of this cost trend may once again make the automobile a luxury most people cannot afford.

You can argue that regulations for safety and emissions are justified—in the case of emissions by the health and environmental benefits to the third parties or the community as a whole; and in the safety area by the savings of lives and reductions in injuries.

But when the reasons for promulgating standards are purely economic—as in the case of auto repair costs—it appears to us no such argument can be made.

No administrator, no matter what insight he may possess, can ever be expected to improve on the forces of the free marketplace in determining the proper balance between higher initial car costs to the buyer versus lower potential repair costs after an accident.

We note that there is language in the bill calling for compliance with specific front and rear barrier tests of bumper systems after January 1, 1975. The bumper situation is a good example of the forces of the marketplace at work. We at Chrysler certainly recognize the potential advantage afforded to the manufacturer whose vehicles are eligible for lower collision insurance rates and which are less costly to repair.

Most importantly, we recognize that there not only is room for improving car bumpers but that the public is demanding that it be done. And, we are doing something about it.

We as well as other manufacturers have publicly stated on numerous occasions in recent months that 1973 model year vehicles will be provided with significantly improved bumper systems.

Further, a ruling of the National Highway Traffic Safety Administration issued on April 14, 1971, requires both domestic and import vehicles to comply with prescribed bumper safety standards beginning with the 1973 model year, and at Chrysler we fully intend to comply with these standards with bumper systems which will prevent damage to the vehicle.

For the 1974 model year, the ruling prescribed additional requirements including provisions for achieving greater uniformity in bumper heights and bumper configurations which go far beyond the provisions of this bill.

These developments will result in significant and progressively greater resistance of vehicles to damage in these low-speed collisions. And, they are being accomplished without the promulgation of property loss reduction standards.

We note that the recent publication of bumper standards by the National Highway Traffic Safety Administration raises a question which could become a real problem should individual States enact bumper laws which are different from the Federal requirements. In this regard, we strongly feel that Federal preemption is needed for both purposes of uniformity as well as to provide some limitation on State activity in new areas of Federal activity such as this bill would authorize.

Chrysler supports the concept of public disclosure of meaningful information on vehicle susceptibility to damage. We expressed a similar view here in Washington over a year ago during an informal rulemaking hearing on exterior bumper protection before the Federal safety agency.

At that time, we advanced the idea of requiring consumer information that would indicate—on a uniform basis—the degree of exterior protection afforded by bumpers on various makes and models of cars. Most importantly, we believe that this is the best means of spurring competition among car manufacturers to design and produce cars that are even more resistant to damage than those currently contemplated.

Toward this end, we believe that this can best be accomplished by requiring the Secretary to collect and publish information on the actual cost of accident repairs by make, model, and year of manufacture for all kinds of vehicles in use in this country. Moreover, we believe that data of this nature already exists within insurance company claim closure records, although it might not be in the form we would need it to collect it and make it meaningful.

Therefore, it would appear to be appropriate for this bill to prescribe for the development and promulgation of regulations governing the manner and form by which all companies engaged in the business of selling or underwriting car insurance would be required to collect and submit accident loss experience information to the Secretary on a periodic basis.

Within the States, insurance companies already are required to justify insurance rates on the basis of actual loss experience. If there is need for testing of production cars to supplement loss experience for rate justification, it seems to us that the burden of such testing should rest with the insurance industry.

We understand that action along these lines already has begun as evidenced by repair cost studies of the Insurance Institute for Highway Safety and Liberty Mutual, as well as the Nationwide Mutual study of "muscle" cars versus "standard" vehicles. This latter study was used by the Insurance Rating Board to justify a substantial surcharge on insurance rates for high performance cars.

This is not to say that the data that has been presented by the insurance industry on these studies is useful or meaningful for consumer comparative purposes. On the contrary, one company clearly indicated that the purpose of its study was to provide a reasonable basis for rating purposes and that it "was not intended, nor is it suitable, for use either to endorse or censure the product line of any automobile manufacturer."

We believe that much work must be done to find appropriate methods that can be applied fairly and uniformly to yield data that is useful for comparative purposes. Moreover, any disclosure information that compares susceptibility to damage of various makes and models between manufacturers must be based on highly reliable and dependable data. Failure to do so could have severe economic consequences upon individual manufacturers, and we feel undesirably and unjustifiably so.

Using actual claim loss experience would have a decided advantage over the provisions in the bill because it would benefit a much wider range of consumers by providing meaningful information on all types of motor vehicles—older cars as well as current models.

And the need is apparent when one considers that there are about two used car sales in this country for every new car sold. Moreover, this approach also would reveal the data being used by the insurance companies to justify and establish insurance rates.

With this kind of information, the buying public would be afforded repair cost comparisons based on real crashes and actual experience. If claims data is collected in a uniform manner, submitted in proper form, categorized so that valid comparisons can be made, and published, the marketplace will have information it now lacks on both the performance of insurance underwriters and on the automobile manufacturers.

Consumers will have freedom of choice to select vehicles suiting their own best interests. Should significant differences in repair costs appear between competing makes in the same price class, manufacturers would leave no stones unturned until they found out the reasons why.

Companies producing cars costing less to repair would undoubtedly advertise and promote this advantage. Others would be striving to

correct repairability problems in future car designs. By this approach, then, the purposes of this bill could be and would then be achieved.

We believe that the provision for supplying consumer information in a simplified and easily understandable form cannot be overstated. There is, of course, a large variety of vehicle makes and models in use today. If one considers these along with the combinations of trim and equipment options influencing repair costs, we fear the resulting compendium of information would be so voluminous as to be worthless to the average consumer.

Thus, it may be necessary to use typical or representative comparisons based on valid statistical data and qualified as to its limitations.

Now, I would like to turn to the personal safety aspects of this bill, those dealing with the development of comparative information on vehicles regarding risk of injury or death.

We have no objection to the Secretary undertaking a study of the feasibility of developing tests and testing procedures designed to allow a determination and comparison of the risk of personal injury or death to passenger car occupants.

However, we note that the bill would allow the Secretary to declare tests and test procedures as "feasible." In our judgment, this term is far too vague and represents an extremely poor measure of reasonableness or practicality when applied to tests or test procedures.

Any measures along these lines must be fair and equitable to all manufacturers for the range and types of accidents that the vehicles could likely encounter as well as for all classes of vehicles. We urge the committee to consider revising these provisions to include some fair test of reasonableness, practicality, and cost effectiveness of tests and test procedures before they are promulgated to be applied to every new passenger vehicle sold in this country.

Another provision of this bill would require automobile dealers to provide comparative data to prospective buyers regarding insurance costs on various makes and models of cars having different occupant injury severity or vehicle property damage characteristics.

Again, we accept the idea of public disclosure of comparative data providing it is valid and meaningful. We also concur with its dissemination by auto dealers. We feel that this information should be published and made available to dealers by the Secretary. We also feel that much of the information would be applicable to prospective used car buyers as well as those contemplating buying a new car.

Chrysler is in general agreement with the proposed amendment to highway safety program standard No. 1 regarding additional State motor vehicle inspection programs. However, we have several suggestions to make which we feel would improve these programs.

We suggest that the committee consider changing the condition requiring inspection upon title transfer to one requiring inspection upon registering of the vehicle. We wish to point out that merely a change of title does not necessarily require that a vehicle be in a safe operating condition. For example, some people today like to purchase older vehicles or less expensive cars and repair or restore them themselves.

In another case, a buyer may plan to use his purchase entirely off-the-street for farm or recreational purposes. In these instances, merely the sale or change in title would not appear to justify the need for inspection to determine the safe operating condition of the vehicle.

However, should these vehicles be used on public streets, they should be certified as to safe operating condition and this could more appropriately be done as a condition of vehicle registration.

We believe it to be the intent of this bill to provide a single vehicle inspection standard applicable to new or used vehicles alike. We support this concept. Moreover, we do not object to requiring inspection of new vehicles.

However, we feel this can best be accomplished by adoption of our earlier suggestion which would require inspection as a prerequisite for registration. Therefore, we suggest that the bill make no distinction between new or used vehicles in this particular provision.

We have some concern that the proposed added inspection conditions when combined with current provisions of the standard could conceivably overload inspection facilities as well as have other ramifications such as shortages in skilled manpower to conduct vehicle inspections.

Along these lines, we feel that the committee might wish to strongly encourage greater use of law enforcement agencies in detecting some of the more obvious type deficiencies and citing owners during onstreet use of these deficient vehicles.

We have all seen these clunkers and know there are ordinances which prohibit their being there, and yet they aren't taken off the road.

If this could be achieved, it would reduce the workload of inspection facilities. In the same vein, it might be more appropriate to permit initiation of these proposed added requirements in stages so as not to overtax the resources of the State concerned.

Initially, for example, new vehicles might be excluded or all vehicles under 2 years of age. Variations of these types already exist in some inspection systems both here and abroad.

Chrysler supports the proposed amendment to highway safety program standard No. 2, concerning State motor vehicle registration and uniform certification of title programs.

In our own vehicle security efforts, we have necessarily worked closely with law enforcement and motor vehicle agencies across the Nation. In the course of this work, we have noted that the lack of uniformity and discipline of common language and terminology in registration procedures among the States has served primarily to the advantage of the car thief.

Closely allied with the need for common terms in registration are uniform titling provisions. Chrysler, along with others, helped develop the Uniform Vehicle Code, and its titling provisions. It is designed to help curtail losses by both buyers and dealers if they inadvertently buy stolen cars or autos with defective titles or undisclosed liens. It also serves as a theft deterrent by providing law enforcement agencies with a legal tool to combat organized car theft.

We understand that eight States still have no certificate of title laws. Yet, statistics show that the ratio of car thefts to vehicle registrations is significantly lower in States with title laws. Additionally, States with title laws appear to have a higher rate of recovery for vehicles stolen.

Most certainly, we consider these registration and titling provisions of this bill a major step in the right direction.

We suggest deleting the punitive provision that would reduce a State's Federal aid highway apportionment should the State fail to implement the programs proposed. Although we recognize the intent of this provision, we feel that such punitive action would not be in the best public interest.

Highway improvements have clearly proved to be "plus" factors in traffic safety. To reduce moneys available to a State for these improvements as punishment for noncompliance with another safety provision hardly seems logical or in the public interest.

We feel that the incentive being offered the States to comply with these requirements through Federal participation in program costs—up to 50 percent—is the proper approach. If States still fail to comply, then we feel that it would be preferable to increase the incentive rather than resort to punitive action.

Finally, we note that this bill calls for motor vehicle safety and property loss reduction standards which require all vehicles manufactured after a given date to be "so designed and constructed as to facilitate motor vehicle inspection, and to facilitate the repairs necessary to meet the requirements of such inspection."

Let me say once again that standards prescribed in this manner can only inhibit progress. For example, once a "standard" is promulgated, say for inspecting brake lining, an innovation in new brake design—one that might require no inspection or replacement in the life of the car—becomes impracticable and well-nigh impossible for an individual manufacturer to introduce simply because it does not conform to the "standard."

With the present and contemplated constraints already being placed upon motor vehicle design and production by both, market demands and Government regulations, it is our candid opinion that these design requirements for inspection would be ill-advised. This is not to say that these types of factors are not or should not be considered in vehicle design. However, so many other factors must be weighed that are more important because of their direct influence on vehicle safety and operation that any effect the proposed requirements would have on future car design would, at best, be negligible and, at worst, could inhibit progress in the development of safer and better cars.

This completes Chrysler Corp.'s formal testimony, Mr. Chairman. I will be happy to respond to any questions you or the other committee members may have. Thank you for your time and attention.

Senator GRIFFIN. Senator Hart, do you have any questions?

Senator HART. Mr. Terry, I apologize to you and to my colleagues, and I will to Mr. Worden, for being absent. I appreciate Senator Griffin's willingness to pinch hit here.

Obviously, I have no questions, having just this minute arrived. Thank you.

Senator GRIFFIN. Senator Stevens?

Senator STEVENS. I have to leave to go to another meeting. I would like to suggest that you have someone submit suggested amendments to take care of those two provisions, one concerning registration concepts, and the other the on-street law enforcement activity.

If you have any suggestions as to how we can reach that, because I think that is a very worthwhile suggestion. The bill presently covers

those vehicles which are going to be transferred and not those vehicles that the original owner is going to drive to death. And it might be in worse shape than the one that someone has gotten ready to sell and gets a good price for.

I would very much like to see that concept in a proposed amendment. Thank you very much, Mr. Chairman.

(The following information was subsequently received for the record:)

According to the information we have, cost is one of the major deterrents to states adopting vehicle inspection programs that do a thorough job. Each time an additional item is required to be inspected, the cost of the program goes up. It seems to us that perhaps one way to attack this problem is to re-examine the equipment which is now subject to inspection and determine if there is some way the number of items to be inspected can be reduced without compromising safety.

Obvious deficiencies are those that a police officer can observe without having to stop the car and perform a street inspection. These include such items as burned out or broken headlights or taillights, dangerous sheet metal hanging from the car, cracked or broken window glass, badly worn tires, noisy vehicles, smoky exhausts, missing engines, and settled or otherwise failed suspensions. We believe that if cars with such obvious visual deficiencies were ticketed on sight, most of the benefits of motor vehicle inspection could be achieved. Moreover, if a vehicle operator could receive a ticket as quickly for driving his car in an unsafe condition as he can for a moving violation, we think few would take the risk.

Ticketing could require that a certificate or receipt indicating correction of the defect be furnished together with the fine, or that a vehicle be inspected at the station after the defect was corrected as a condition to settlement of the violation. Such a law could stand on its own in lieu of motor vehicle inspection. Or, it could be used in conjunction with a periodic motor vehicle inspection system thereby easing the load on inspection facilities.

With regard to overtaxing of inspection facilities, we note that the State of New Jersey recently announced that it will remove all *new* cars from the State's motor vehicle inspection program beginning in July—to decrease waiting time. In lieu of state inspection, new cars will be inspected by dealers who must certify that the vehicles meet safety inspection standards. Dealer certification will be valid for one year and is expected to cover about 400,000 new cars annually.

The transferring of title from one owner to another does not necessarily mean that the new owner is going to use the vehicle on the public streets. A number of cars are bought for other uses such as, restoring historic vehicles, using the vehicle purchased for parts, using the vehicle for a variety of off-road purposes. Also, there are some states that do not have title laws (New York being the most notable example). In those states, inspection could not be required prior to the transfer of title because no such transfer takes place.

Therefore, we feel the requirement for inspection should be at the time the vehicle is registered to a new owner which permits it to be used on the public streets in every state. It should be pointed out that this method may result in over inspection of those vehicles having a number of owners within a one-year period.

#### ODOMETER AMENDMENT

Although Mr. Terry did not comment on the odometer amendment at the time he testified, Chrysler supports the amendment. We believe that the consumer should be provided with the information he needs to make an intelligent purchase of a car. We have long supported this type of legislation in the states.

#### PREEMPTION

Should the Congress decide to legislate property protecting bumpers despite our objections, we definitely would favor preemption of state laws or requirements on the same subject. On the other hand, we would much prefer that the property protecting bumper provision of this Bill be deleted even if this should result in our having to provide special property protecting bumpers to meet individual state laws. This is all the more true since we are confident that, by 1975, competitive pressure of the marketplace will have satisfied public demands in this area.

Senator GRIFFIN. Mr. Terry, like the previous witness, I think you have also presented a positive and constructive statement, one that has a number of useful suggestions that will help the committee, as it gives further consideration to this legislation.

I am interested in the alternative you suggest in your testimony to this elaborate testing of production models before you could actually sell cars—that pending legislation should utilize actual repair costs. As I think about that as an alternative, I have been wondering about how the legislation as drafted would apply to imported automobiles.

I know that your company is at least very much aware of the competition and the problem of imported automobiles. How do you understand—if you do understand—the legislation as drafted? How would it apply to automobiles manufactured in a foreign country?

Mr. TERRY. Well, I think it would be very difficult, to say the least, for the foreign manufacturers to comply with the legislation. But I haven't really thought too much about the problems of the import car manufacturers because we haven't been able to figure out how to do our own job domestically, frankly.

The thing is unmanageable in our view, completely. We talk about—an earlier witness has suggested this—we talk about the time limit we have to do this in, trying to test production vehicles with a number of different tests, because it would be, as we visualize it, at least, 10 tests for each make and model and when you add options such as air conditioning, with and without, that doubles it. And you get into 400 or a thousand tests very quickly.

And it is not just running the tests but it is also having somebody come in or finding some other way of figuring out the cost to repair each one of these accidents, and then getting the information together and sending it to the Secretary. During this time we are building automobiles, in production already, but we have not yet announced them.

Now, these cars can't actually be sold to the public theoretically until the cars are announced. So you see you have an unmanageable inventory situation as the leadtime extends; what happens to the cars during this period? The whole production machinery and the way we do things just doesn't fit with this proposal at all.

Now, on the other hand, we believe that the proof of the pudding is in the eating; in other words, what really happens out there. Now I am sure you gentlemen know a lot more than I, having conducted these hearings, about all the various complications that you get into when you start to try to reduce insurance costs.

There are a great many factors. We at Chrysler—and I am an engineer, a technical man myself, basically—we at Chrysler have been trying to find out by some way or other what part design engineering plays in insurance costs. And the way we would propose to find out would be to get some information.

The only kind of information that would do us any good would be information on cars of a certain make and model year, in accidents that are at least similar. We could then compare those with other cars of the same make and model year in similar kinds of accidents.

But that information we have just not been able to get from any source.

Now, it could be compiled, obviously, and the data is there, and we think if a provision were made to collect this data in the proper categories and so on, it would be very useful not only to us but to all the

rest of the manufacturers and the insurance companies. Until we have information, we certainly cannot possibly figure what to do about it. These proving ground tests that might be promulgated where you would run cars presumably into other cars or into a barrier, would be so difficult to promulgate that we just think any similarity between the results of these artificial tests and what actually happens in the field would at best be coincidental.

We found, for example, that the shape of the bullet car bumper in a 45-degree side impact at the door has more to do with the amount of penetration and hence, I suppose, the repair costs of the car that it strikes than whether or not there is a side guard beam in the car that it strikes.

We ran another series of tests in connection with bumpers where we found that stiffening the corner of a bumper so it could pass a corner impact requirement actually caused an entirely different kind of crash between two approaching cars where they just barely hit each other to the extent that the car with the reinforced bumper did make \$800 or \$1,000 worth of damage to the car it hit, whereas the car with the weaker bumper, the original it started out with, kind of glanced off and only did one-third or one-quarter of the damage.

So, here you have got a case. I simply cite these actual test results to show that the collision damage situation is a very, very complex matter, and not one that you can really duplicate by running some tests at the proving ground.

Senator GRIFFIN. Mr. Terry, I think the answer to this question is obvious; but the cost of labor and making repairs is a significant item, isn't it?

Mr. TERRY. Yes, sir. Another reservation I would have about the ability of manufacturers to get the same kind of results that you get in the field. We would have standard mechanics who are really familiar with the cars and we would normally have them either fix the cars or estimate the cost of repairs, but we do not do some things that are commonly done in the field like straighten bumpers perhaps; in other words, manage to use the parts rather than replace them with used parts and the decision as to whether to replace or repair is always difficult, and it is different in almost every shop.

Senator GRIFFIN. In the repair shops around the country, is the rate of labor considerably different in one part of the country than another, and in some areas of a State than other areas of a State?

Mr. TERRY. Yes; I understand it is very different. I am not an expert in these matters, Senator Griffin. I just know in my own experience and the experience of members of my family having cars repaired, that by going to different shops you can get vastly different estimates.

Senator GRIFFIN. If the legislation were to utilize some system of publicizing actual cost data on repairing real accident cases, these differentials would become or could become apparent?

Mr. TERRY. Yes, I think it would—

Senator GRIFFIN. And taken into account?

Mr. TERRY. Yes; information would certainly help the situation, information as to actually what is happening. That is what everybody needs to improve the situation, in my opinion—just more information as to what is going on out there.

Senator GRIFFIN. Whereas the tests in your shop without any regard to what actual rates may be somewhere else may not be too significant in terms of insurance rates, depending on how much of it percentage-wise would be attributable to labor cost, I would assume?

Mr. TERRY. Well, that is right. The tests that we run, almost any tests I can visualize we would run, would be very unlikely to actually correlate very well. There has been an awful lot of talk about the barrier tests that Dr. Haddon and his insurance institute for highway safety have run. Just to infer that what happens in the 5-mile-an-hour barrier test is an index of what happens when cars actually crash together is a very, very dangerous assumption.

When you hit a barrier, you can be sure that the foremost part of the bumper is going to hit that flat barrier. But if the foremost part of that bumper is low or high and that same car hits almost any other car, the bumpers may not even contact. So the information you got out of the barrier crash is just not going to be applicable if you don't have a good bumper that meets other bumpers.

So it is a very complex situation, and we do not feel that the insurance institute figures represent the degree of susceptibility to damage any more than any other kinds of tests we can think of—any one kind of test.

Senator GRIFFIN. I have no further questions.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Mr. Terry, you make a statement that what we really need is more information in the hands of the consumer so that he can make more considered judgments as to the type of vehicle that he should purchase.

Mr. TERRY. In our hands, too.

Mr. SUTCLIFF. And in the hands of the manufacturers so they will know better what requirements the car environment actually required.

At the present time you are required to submit information to the Department of Transportation as to certain aspects of vehicle performance. Take, for example, the aspect related to the ability to take a vehicle from 60 miles per hour and bring it to a stop. That information is then compiled in a consumer information bulletin and is made available to the consumer through the dealer.

It is very interesting information, because it shows that there is a variety of stopping distances ranging from 135 feet to decelerate from 60 to 0 miles per hour to, at the high end of the spectrum, 263 feet, if my memory serves me correctly, to decelerate from 60 to 0 miles per hour.

It so happens that the car that takes the longest distance to stop is also a light car, and some of the heavier cars stop in distances of 165 feet, for example. According to your rationale, that type of information in the hands of the consumer should have a very positive effect upon manufacturers designing vehicles with shorter stopping distances because the consumer obviously, presented with that information, would want a vehicle that stopped at a shorter distance.

So, when you actually had wheels skid and when you did not is a very difficult thing to describe. You cannot allow the wheels to skid during the stopping operation. So, this means again that you have to be conservative in what you estimate you can do, and you want to be sure not to give a lower figure for every car than you can actually achieve.

Mr. TENY. We have some tire combinations and some loading combinations which may cause a relatively unfavorable weight distribution. The reason that we feel that the consumer is not too concerned about this—you see, there are other stopping distance requirements too, such as a wet pavement, and there you want a different weight distribution for maximum stopping ability than on a dry pavement. So whether a car is well designed or not, you have to ask whether you want a car that will stop quicker on a wet pavement or on a dry pavement. A lot of people would select one on a wet pavement.

Mr. SUTCLIFFE. At the present time do they have the information available to make either selection?

Mr. TERRY. Yes; there is plenty of information available on braking to the consumer in my opinion.

Mr. SUTCLIFFE. And that information has had a very beneficial impact upon the design of cars, cars' braking capabilities are being improved daily because of consumer choice in the marketplace, selecting out more appropriately cars that have better stopping distances?

Mr. TERRY. I do not know that the consumers are actually selecting cars with better numbers and we do not have any very good way of knowing that. Our information from our marketing people and from what we read in the press, surveys of various kinds, indicates that the consumer is not using this information very much.

Mr. SUTCLIFFE. How would they then use the information as to bumper capability that you suggest we rely upon rather than Federal standards?

Mr. TERRY. I said you would use insurance rate information.

Mr. SUTCLIFFE. Let's say we take that rate information in to the Secretary of Transportation who then puts it in a little companion booklet, Consumer Information Booklet No. 2, and hands it out to the dealers and says if a consumer comes in and ask for that information you are to make it available to him and you have to have that information available in the glove box of each car that is in fact sold. That information would have been digested by the Department of Transportation to give you, say, three or four different ratings. This car is A, B, C, or D as to property damage susceptibility and as to injury severity it is A, B, C, or D. The consumer is supposed to look at that and say I have an A here and a C here and different characteristics and I am supposed to use that in my decision to purchase a vehicle. That is conceivably one of the ways in which consumer information could be put out. Otherwise you could translate it right into insurance premium cost for the consumer in some way as S. 976 suggests you do.

We have all been on the highway when suddenly there is a panic stop, and there is a difference between a collision and no collision if you have that stopping capability.

What is your evaluation at the present time of the consumer information bulletin that the Department of Transportation makes available to dealers who are then in turn supposed to make it available for the consuming public?

Mr. TERRY. Well, I do not think the public uses it much. This particular example that you give for stopping distance is interesting. Actually, there is very little difference in the ability of cars to stop as far as the number of feet it takes for them to stop assuming that you have proper weight distribution for the conditions involved.

Now, there are a number of reasons why the data is spread out as much as it is, but —

Mr. SUTCLIFFE. Could you tell the committee what a couple of those reasons are?

Mr. TERRY. Yes; not the least of the reasons is we do not want to—we are permitted, let us say, to put down a stopping distance that we know will be greater than what the vehicle can actually do if we wish to. We are permitted that leeway. We do not run every make and model of car to determine its stopping distance. We divide them into groups, pick out the points where there is a fairly big gap in the group, and then we test the worst one, and we put down the same number for others so we know we can do at least as good or better than that. So we do not put down the best figure we can do for that particular one.

Another reason is we want to be sure and not give a lower figure than the vehicle can do. We want to be sure we can do better. We have tolerances on vehicles which are unavoidable. Brake lining varies from one vehicle to another. The way that these tests must be run is they must be run without allowing the wheels to skid, and this is a kind of subjective thing because we can go out and have skilled drivers run tests and every second or third time the skilled driver will skid the wheels and we have to go back and run the tests again.

I think the question is will that information in the hands of the consumer cause the free market system to select those vehicles that have the lower susceptibility to damage and therefore the competitive pressures improve the environment.

Mr. TERRY. Let me put it this way, Mr. Sutcliffe. We do not know what that information is. We do not know that there is a significant difference due to design in repair costs. We have not been able to get that information. Not knowing what it is, we cannot really estimate as to whether or not the information as to what differences are is going to influence the consumers or not.

If there turned out to be big differences in repair costs and car A is on the average \$100 cheaper to repair than car B, I am darned sure that the consumer would take account of that and do something about it.

We cannot lead the consumer to decisions on the basis of information we do not even have yet. I think the reason why the consumer is not paying more attention to these consumer information guides is that it is not significant, the differences are not significant. It does not tell him anything he does not already know.

If we do go to the actual data and find out what the differences are in cost of repairs on a statistical basis and it turns out that the differences are not very great, I am sure it would not mean much to the consumer.

Mr. SUTCLIFFE. You have 100 feet of stopping distance on that one, and you are suggesting that is not really a critical difference?

Mr. TERRY. I do not know what the high one is. I know what the low one is. It is a foreign-make car; and whether they would be able to do it on every car or not, I would bet you they could not.

At any rate, I am saying that the consumer thinks he knows that his car will stop satisfactorily and he is not interested in this data because he believes he has got good brakes and can stop under the conditions he wants to stop under.

Mr. SUTCLIFFE. I appreciate that exchange, and I think it will be very helpful for us to understand the import of your suggestion that we rely upon information in the free market system to foster these beneficial developments.

One final question. You argue against the setting of Federal property loss reduction standards on the theory that the free market system should be utilized instead. But then in another part of your testimony you argue for Federal preemption of existing State requirements.

Now, how do you propose to achieve Federal preemption of the statement requirements without having a Federal standard by which to preempt the State standards?

Mr. TERRY. Well, we have a Federal standard on bumpers.

Mr. SUTCLIFFE. But that is not on property loss reduction.

Mr. TERRY. I do not feel that a property loss reduction standard is required on bumpers.

Mr. SUTCLIFFE. But some States have promulgated property loss reduction standards on bumpers.

Mr. TERRY. Yes.

Mr. SUTCLIFFE. Or for vehicles through the use of bumpers.

Mr. TERRY. Yes. But, of course, what we are aiming at is not to have to build a lot of different kinds of cars for different States because of the cost involved and the complications involved.

Mr. SUTCLIFFE. So, one uniform standard at the national level would be preferable than 50 State standards that might be passed?

Mr. TERRY. Yes, sir.

Mr. SUTCLIFFE. I have no further questions.

Senator HART (presiding). Again, thank you very much, Mr. Terry, and for the third time my apology for having been unable to hear the testimony.

Mr. TERRY. Thank you, sir.

Senator HART. This concludes our list of witnesses for today. We adjourn to resume in this room at 10 o'clock tomorrow morning.

(Whereupon, at 3:20 p.m., the hearing was recessed, to reconvene at 10 a.m., Tuesday, May 11, 1971.)

(The following information was referred to on p. 1273:)

APRIL 16, 1971.

HON. MILES KIRKPATRICK,  
Chairman, Federal Trade Commission  
Washington, D.C.

DEAR MR. CHAIRMAN: The most recent issue of the *Yale Law Journal* (Vol. 80, No. 3) contains an article by a third-year law student which effectively argues that the annual model year style change practiced by the American automobile industry is an "unfair" trade practice under Section 5 of the Federal Trade Commission Act. Based on the excellence of the research and reasoning of this article, I am joining with the editors of the *Journal* in signing the attached petition to the Federal Trade Commission, requesting an immediate investigation of the anticompetitive effects of the annual restyling practice in the American automobile industry.

This law journal article has significant and simultaneous impact in two independent areas. First, the subject of the article and petition affects us all. The automobile industry's annual style change has had its intended effect: all competitors but four have been forced out of American industry, while the impenetrably high cost barriers created by frequent restyling have excluded listing new entrants for almost 50 years. Although foreign companies have recently encroached on the United States domestic market—15.3% of all cars sold in this country in 1970 were foreign-made (although over 10% of these were from United States-owned companies)—it has not altered the persistent fact of con-

centration: three American firms still account for about 83% of all auto sales in the United States last year and about 90% since 1935. It must also be emphasized that foreign sales have been limited mostly to either small, low-priced models (Volkswagen and Toyota) or to luxury types (Mercedes, Jaguars and Rolls Royce). The vast middle range of intermediate models remains virtually unchallenged by foreign manufacturers.

The styling issue is especially timely now, given recent statements by the Chairman of the two largest American auto manufacturers. James Roche of General Motors blames his critics for destruction of the free enterprise system when, in fact, that system lost out in the automobile marketplace shortly after initiation of the annual model year change introduced by General Motors in 1923. And Henry Ford II has stated with unaccustomed candor: "[O]ur customers are increasingly interested in reliability, safety, utility, and economy more than in styling novelty." So much for the oft-repeated industry myth that the public demands three-pronged fins and grinning grille patterns.

In an industry where competition has been centered on petty styling distinctions, sales are heavily dependent on industry advertising to transform trivia into deceptive significance. The huge advertising expenditures, which broadcast annual style changes and their psycho-sexual associations, push the barriers to entry yet higher.

Not only is the dominant advertising of style changes costly and displacing of functional production information to the consumer; it is also inherently deceptive. Your "totally new Impala" is nothing of the sort; it is a warmed-over version of last year's "all new Impala", graced by the rhetoric of a complete change to induce new and trade-in sales. It is a scarcely changed Impala sold in a "new" model year. And you are not told that the cost of repairing your 1971 Impala after a five mile per hour front or rear crash is almost double the cost of similar repairs on last year's new Impala (see March 10, 1971 testimony by the Insurance Institute for Highway Safety before the Senate Commerce Committee). Thus, consumers are persuaded to accept styling changes because they believe they are getting a basically new product with the style change merely the indicia of that newness. They are manipulated into thinking they are getting something when they are not—when, indeed, they are losing the added quality, safety, and durability which styling expense and promotion displace. Believing the lies, consumers are then hoist on their own trust.

Moreover, the consumer has little choice in his preferences, since this tight oligopoly has imposed very limited options with stylistic features (like fins) as "standard equipment" without their distinct cost disclosed, while safety features are offered as optional, extra cost equipment. One could easily imagine wider choices and combinations around function (cheaper care without these so-called styling changes and cars with significant product improvements instead of expensive styling), if styling were not a strategy to perpetuate a tight oligopoly, aftermarket sales, and barriers to entry. The economies of scale of the Big Three more than afford such functional rather than stylistic product differentiation.

The annual model change has other detrimental by-products: (1) The billions spent on design (estimated by Senator Gaylord Nelson at \$1.5 billion per year just for new dies and tooling) is money, talent and ingenuity withheld from important performance innovations (performance changes are estimated at three percent of style expenditures by the Bureau of Labor Statistics (BLS)). As former Ford Vice President Donald Frey told an engineering audience in 1964: "The automatic transmission [adopted in the late Thirties on a limited mass production basis] was the last major innovation of the industry."

(2) It has become a basic deterrent to rapid implementation of needed safety and pollution regulations. The Department of Transportation, for example, from the beginning has adjusted the effective dates of new rulemaking to the model year style change, allowing two, three and even four years lead time because designs are "locked up" several years in advance of production. Thus, while 56,000 people annually are killed and millions injured in auto crashes, vision-obscuring fastbacks are constructed, the wheel base is extended two inches, the antenna is molded into the windshield, and windshield wipers are hidden in sharp crevices which slice through passengers in frontal crashes.

(3) The styling changes *themselves* are often dangerous to pedestrians and occupants. The stylistic demons produced for annual model showing continue to incorporate pointed bumper weaponry which increases the toll of 10,000 vehicle/pedestrian deaths and half a million injuries each year. Hood ornaments, absent from American vehicles for the past several years, are now returning to their prominent frontal position at about the level of a five-year-old's head. The

notorious horn ring and dashboard slicers have severely injured vehicle drivers and passengers, while the hard top model has weakened the side and rollover protection for occupants. A violent stylistic pornography prevails over humane engineering integrity.

(4) Constant body and parts alterations to accommodate new exterior and interior designs often result in safety defects. By the time a design is perfected, new style changes sufficiently alter the structure to create new defects, *ad infinitum*. The car model does not endure long enough to benefit from manufacturing and usage experience. Only new safety and durability features justify such annual changes.

(5) Focusing on pollution, a three-firm oligopoly can resist public and governmental pressures to be innovative on anti-pollution implementation. With a huge capital investment in existing manufacturing equipment, any such change is viewed with hostility. The illegal collusion uncovered and described in the 1969 Justice Department "smog" complaint is an example of how an oligopoly can rest on its conspiratorially-orchestrated oars until challenged by the law. And the introduction of a wholly new propulsion system—whether steam, electricity, turbine, freon or hybrid—is made impossible by the entry costs of large plant economies, advertising outlays and vertical integration which annual styling change requires.

(6) Annual style change buttresses the industry's profiteering in "aftermarket" (replacement parts) sales. Frequently redesigning parts, many of which will need repair, and then coercing the car buyer to return to the franchised dealers for replacement under the warranty system, guarantees the companies a lucrative return. Sculpturing the sheet metal slightly differently from year to year, for example, insures a captive parts aftermarket. Only Chevrolet can afford to sell a replacement part for the the 1969 Chevy and a differently-shaped part for the 1970 Chevy. Style leads to fragile ornamental bumpers, which permit the aftermarket sales of enormous quantities of crash parts, as a widely acknowledged within auto insurance circles. A recent Ph.D. thesis argues that General Motors' 20% average rate of return on capital is due largely to its parts sales (R. W. Crandell, Vertical Integration in the United States Automobile Industry).

The *Yale Law Journal* article emphasizes Section 5 of the Federal Trade Commission Act as the preferred statutory vehicle for legal attack. It is understandable why the author is pessimistic about the prospects for a "shared monopoly" suit in the auto industry. The basic problem of such a suit, however, is *not* that adequate legal doctrine does not exist to support it. By combining the size *per se* language of *Alcon* (1946) with the oligopolistic parallelism found in *American Tobacco* (1946), *Cement Institute* (1948), motion picture cases (1948), and motion picture advertising case (1954), and by utilizing the ignored "retroactivity" principle of *General Motors-DuPont* (1957), a shared monopoly suit to divest the auto companies vertically and horizontally could be instituted. Such a theory has been discussed at the Justice Department and proposed by repeated high level staff studies as a basis for a complaint in the auto industry (among others), but it has never been favorably acted upon by an Antitrust Assistant Attorney General. The Section 5 approach presently appears the most favorable statutory route, but only until the Antitrust Division summons up its courage to utilize the ample precedent which exists.

One relief alternative mentioned in the Yale article would declare a "fixed term moratorium" on style changes—but not performance changes. The Bureau of Labor Statistics (BLS) presently makes such a distinction in computing the price indexes. But before a BLS or similar system is relied on to make such judgments, two things must be stressed: (1) engineers, not only economists, must help in the analysis of quality vs. styling changes; and (2) there must be independent sources of information on automobiles—sources other than the auto firms themselves. Since BLS presently lacks both, being largely tied to the industry for its source of information, it is an inadequate call for judging what are styling changes.

This petition is an important example of citizen involvement in our legal enforcement system. In the field of discrimination, *Brown v. Board of Education* and *Jonas v. Mayer*, two private suits, established the most innovative precedent on racial discrimination in the last two decades. The policing of our corporations is also too important to be left merely to government agencies—agencies which have often adopted the principle that least is best. This petition, however, is not a lawsuit (which the federal regulations do not permit in this case) but a request for an investigation pursuant to a complaint. It is now incumbent on the Federal Trade Commission to break the perennial failure of antitrust en-

forcement in the auto industry. The task is large but the return to consumers and a competitive economy is immense, both in economic and safety-health terms.

A second and related contribution is made by publication of this article and filing of this petition. It adds to the trend that law schools and law journals are no longer content to count angels on pinheads. Attentive to problems of policy as well as procedure, eager to have an impact beyond classroom recitation, law students are beginning to devote their skills to serious contemporary problems. The utilization of this reservoir of energy and creativity cannot be underestimated, for it is often the student-scholar who can best illuminate the difficult legal issues which the legal profession is too busy, or too financially jaundiced, to confront. Industrial corporations have for too long evaded the scrutiny of legal scholarship, often by coopting their potential critics. That is now and here changing.

Sincerely,

RALPH NADER.

STATEMENT FOR THE PRESS, FOR RELEASE AT 12 NOON ON SUNDAY, APRIL 18, 1971;  
AND TO MORNING PAPERS OF MONDAY, APRIL 19, 1971

Annual change in the style of automobiles has become an accepted way of life in this country, but now such change is under attack as a violation of the federal antitrust laws.

The attack against the style change policies of the Big Three automobile manufacturers appears in a complaint by Ralph Nader and members of *The Yale Law Journal* which was filed with the FTC on April 19, 1971. The complaint is based on a new antitrust doctrine developed in a special study that appears in the latest issue of *The Yale Law Journal*, a publication edited by Yale Law students.

The study describes a new antitrust theory under which annual style change may constitute an antitrust violation. Currently, annual restyling in the automobile industry is considered immune from prosecution under conventional Sherman and Clayton Act doctrine because of the absence either of monopoly or of explicit agreement among the Big Three. The *Journal* report adopts a new approach and demonstrates that Section 5 of the Federal Trade Commission Act empowers the FTC to investigate and to bring suit against this practice. Style change, the article concludes, is an "unfair method of competition" under the Act because it prevents new firms from entering the automobile industry.

For nearly fifty years, General Motors, Ford and Chrysler have annually changed the styles of their automobiles. The study suggests that this practice has occasioned an exit by more than 80 smaller automobile producers and barred future entry into the industry. As a result, since 1935, the Big Three have accounted for about 90 per cent of automobile sales in the United States. This concentration of sales in three firms, the report notes, is generally considered to be inimical to competitive conduct in an industry.

The article demonstrates that "concentration-increasing" practices such as annual style change were what Congress sought to prohibit when it passed the Federal Trade Commission Act in 1914 and calls upon FTC to fulfill the role that Congress had originally designed for the agency.

The report urges that "the broad legislative mandate and judicial development" of Section 5 of the Act compels the FTC to strike down annual restyling by the Big Three as an "unfair method of competition." Breaking the automobile manufacturers into several autonomous companies, it adds, would be the most appropriate and effective remedy.

The study, "Annual Style Change in the Automobile Industry as an Unfair Method of Competition," written by Bradford C. Snell, a third year law student and editor of *The Yale Law Journal*, is contained in the *Journal's* most recent issue (Vol. 80, no. 3, pp. 567-613) which was released today. The *Journal*, published monthly, carries articles by students, faculty and other legal experts.

"Industrial competition is the unequivocal premise of free market economic theory and of antitrust doctrine," the study begins. "Automobile manufacturing is one of the least competitive industries in the American economy."

Ninety-seven per cent of domestic automobile production is centered in three firms; four firms account for all passenger vehicles produced in this country.

Such a highly concentrated structure, the report says, precludes effective competition and satisfactory performance.

As a result, "the industry is characterized by inflated selling costs, product imitation, higher than competitive prices, collusive suppression of technological innovation, and persistently high rates of return." The study notes, for example, that pollution-free electric and steam vehicles can now be produced which would cost half as much to own and even less to operate than conventional gasoline automobiles. Yet the introduction of these new vehicles has been suppressed by the Big Three.

Annual restyling required four activities which small producers could ill-afford to undertake: in-house production of body and engine components, formidable advertising campaigns to accompany new model introduction, a nationwide network of franchised dealers, tremendous capital resources.

"Whether by design or mere accident," the report states, GM's introduction of annual style change in 1923 "eliminated smaller producers unable or unwilling to restyle their products every year." There were 88 American automobile manufacturers in 1921. In the course of three years, from 1923 to 1926, 48 left the market. By 1935, only 10 firms remained, with the Big Three holding 90 per cent of the market.

"Style change has proved to be as effective a market weapon" in discouraging newcomers as it had been in eliminating earlier automobile companies, the study observes. It constitutes an insuperable barrier to new entry. As the report points out, "not a single firm has entered and survived in the automobile industry since 1923."

A prospective firm would need nearly a billion dollars to break into passenger car manufacturing, the study estimates. Had annual restyling not restructured the industry, it calculates that a firm could enter today for less than one-tenth of this cost.

This Big Three may also employ style change as a substitute for cost savings innovations. "By introducing a restyled model each year," the report says, "they provide consumers with the illusion of progress" yet avoid making improvements which might extend the life of automobiles.

A sharp distinction is drawn in the study between style and performance changes. Smaller producers, it notes, were able to develop significant automotive innovations. But the style change race ultimately eliminated all but those with huge facilities and tremendous capital resources.

According to the report, the annual change of automobile models has consisted predominantly of style rather than performance alteration. It says that in the past four years the Big Three have spent about \$1½ billion annually to change their models, but that less than 3 per cent of this amount was expended on performance improvements.

Annual style change by the Big Three has never been attacked under the antitrust laws. The law journal study suggest, however, that Section 5 of the Federal Trade Commission Act prohibits practices which, like annual restyling, substantially increase industry concentration.

Thirty years ago, recalls the report, the FTC expressed concern that the "increasing importance of the style factor, the huge capital and equipment resources required to finance new models" might eliminate smaller though no less efficient competitors of the Big Three. Today all but one, American Motors, have vanished. "Only the FTC's political or administrative paralysis," the study says, "bars bringing a successful suit against the three automobile manufacturers."

If the FTC sues the Big Three, and wins, it would be entitled to far-reaching sanctions. As the fundamental impact of annual restyling was concentration of production in the hands of three firms, suggests the report, breaking these corporations into several autonomous producers would be most appropriate and most effective in restoring competition to the automobile industry.

APRIL 19, 1971.

#### REQUEST FOR AN FTC INVESTIGATION

Pursuant to 16 F.C.R. sections 2.1 and 2.2 the following named individuals and organizations request that the Federal Trade Commission institute an investigation of annual restyling practices by General Motors Corp., with offices and principal place of business at the General Motors Building, Detroit, Michigan, 48202; Ford Motor Co., with offices and principal place of business at The

American Road, Dearborn, Michigan, 48121; and Chrysler Motors Corp., with offices and principal place of business at 12200 E. Jefferson Ave., Detroit, Michigan, 48231, for alleged violation of Section 5 of the Federal Trade Commission Act, 15 U.S.C. sec. 45 (1964). Supporting information regarding the alleged violations is attached to this request.

Snell, Ron Gilson, John Rupp, David Cook, David Kaye, Jim Huntwork, David Schulte, John Kuhns, Barbara Brown, Eric Neisser, Nancy Gertner, Steve Hadley, Tom Jorde, John Crook, John Dystel, Mark Tushnet, Larry Lustgarten, Harold Kwalwasser, Jeff Glekel, Linda Tedeschi, Rick Block, Bill Kelly, Steve Oxman, Steve Munzer, David Schneider, Jerry Wilkerson, Reid Feldman, Al Wilensky, Jerry Siegel, Susan Goldberg, Henry Fields, Andy Hurwitz, Stan Jaspan, Dan Steinbock, Peter Hamilton, Stan Inghber, Bob Carter, Members of: The Yale Law Journal, Yale Law School, 127 Wall Street, New Haven, Conn. 06520.

## Annual Style Change in the Automobile Industry as an Unfair Method of Competition

Bradford C. Snell

Since 1935, General Motors, Ford and Chrysler have accounted for about 90 per cent of automobile sales in the United States. This Note will argue that such a concentration of sales in three firms is inimical to competition in this industry. Moreover, it will contend that these firms achieved and preserved undue concentration in violation of Section 5 of the Federal Trade Commission Act through their pursuit of an "unfair" trade practice: annual style change. Part I briefly sets forth the relevant economic and legal criteria for evaluating competition in the automobile industry. The preliminary economic analysis in Part II suggests the anticompetitive nature of annual style change which justifies a more searching analysis by the Federal Trade Commission. Part III argues the applicability of Section 5 of the Federal Trade Commission Act to annual automobile style change, and Part IV outlines some considerations regarding appropriate relief which the FTC could seek.

### I. Evaluating Competition

Industrial competition is the unequivocal premise of free market economic theory and of antitrust doctrine.<sup>1</sup> It is generally evaluated in terms of three distinct market elements: structure, conduct and performance.<sup>2</sup> The competitiveness of an industry's structure depends upon

1. The most thorough treatment of the combined legal and economic implications of industrial competition is that of C. KAYSER & D. TURNER, *ANTITRUST POLICY: AN ECONOMIC AND LEGAL ANALYSIS* (1965). That competition is the fundamental premise of antitrust doctrine was proclaimed early by the Supreme Court in *Standard Oil Co. v. United States*, 221 U.S. 1, 52 (1911); and more recently in *Northern Pacific Ry. v. United States*, 356 U.S. 1, 4-5 (1958): "the unrestrained interaction of competitive forces will yield the best allocation of our economic resources, the lowest prices, the highest quality and the greatest material progress . . ."

2. For a lucid economic analysis of the structure-conduct-performance analysis, see R. CAVES, *AMERICAN INDUSTRY: STRUCTURE, CONDUCT, PERFORMANCE* (2d ed. 1967). A more exhaustive description of this analytic framework is provided in J. BAIN, *INDUSTRIAL ORGANIZATION* (2d ed. 1968) [hereinafter cited as *INDUSTRIAL ORGANIZATION*]. For a general application of this analysis to antitrust problems, see C. Mueller, *The New Antitrust: A Structural Approach*, 1 *ANTITRUST LAW & ECON. REV.* 87 (Winter 1967); S. Smith, *Antitrust and the Monopoly Problem*, 2 *ANTITRUST LAW & ECON. REV.* 19 (Summer 1969). This framework has also been recently employed in the courtroom. See, e.g., transcript excerpts from *Columbia Broadcasting System, Inc. (FTC 1967)*, reported by Hirta, *Economics in the Courtroom: A Structural Defense in a Monopoly Case*, 1 *ANTITRUST LAW & ECON. REV.* 45 (Summer 1968); *Golden Grain Macaroni Co. (FTC 1969)*, reported by Scanlon, *"Technology" of Antitrust Litigation*, 3 *ANTITRUST LAW & ECON. REV.* 43 (Fall 1969).

market concentration (the number of firms and their individual shares of industry sales) and barriers to entry (obstacles that impose on newcomers higher costs per unit than those encountered by the established firms).<sup>3</sup> The competitiveness of an industry's conduct depends upon how constituent firms make price and output decisions (independently, interdependently or collusively) and with what purpose or effect (enhanced interfirm rivalry, exclusion of newcomers, or predation).<sup>4</sup> The competitiveness of an industry's performance depends upon the extent to which its conduct contributes to progressiveness (the number and importance of actual innovations as compared with what optimally could have been developed) and to efficiency (the reduction of costs and prices to absolute minima).<sup>5</sup>

#### A. *Economic Criteria; Market Structure as the Determinant of Industry Conduct and Performance*

Holding that structure determines conduct and conduct determines performance,<sup>6</sup> much antitrust economic theory posits that an anticompetitively structured industry precludes the long-run survival of effectively competitive conduct and performance.<sup>7</sup> In fact, empirical studies indicate that high market concentration and high barriers to entry (structural factors) engender price fixing, price leadership, product imitation and other forms of collusive and interdependent behavior

3. The competitive significance of market concentration is said to lie in the fact that, as the number of firms decreases and the percentage of total industry sales held by each increases, the probability of their recognizing their "mutual interdependence," i.e., starting to price like collective monopolists rather than independent competitors, begins to increase significantly beyond a critical point. Mueller, *supra* note 2, at 89.

Barriers to entry are generally treated in three separate categories: (1) scale economy barriers (cost disadvantages resulting from inefficient levels of production), (2) product differentiation barriers (relating to promotional cost disadvantages), and (3) absolute cost barriers (primarily cost disadvantages encountered by entrants in securing essential input factors, e.g., patents or capital). For a detailed explication of these various concepts, see J. BAIN, *BARRIERS TO NEW COMPETITION* (1956) [hereinafter cited as *BARRIERS*].

4. As distinguished from structure or performance, "conduct" refers to those actions taken by the individual firm as part of its competitive strategy. It involves two dimensions: (1) whether price and output decisions are made independently or collusively (collusion in the economic sense, thereby including interdependent oligopoly behavior as well as conspiratorial overt or tacit agreement), and (2) the intent (i.e., predation) or effect (heightened interfirm rivalry or exclusion of competitors). Mueller, *supra* note 2, at 90.

5. "Performance" refers to the appraisal of how much the economic results of an industry's conduct deviate from the best possible contribution it could make to achieving the general goals of a free market economic system, particularly efficiency in production, distribution and progressiveness in the development and application of technological innovation. See CAVES, *supra* note 2, at 96-115.

6. Mueller, *supra* note 2, at 89-90.

7. *Id.* at 91. "[A]n industry which does not have a competitive structure will not have competitive behavior." United States v. du Pont (Cellophane), 351 U.S. 377, 426 (1956) (dissenting opinion).

## Automobile Industry

(conduct), which lead to artificially inflated prices and diminished rates of innovation (performance features).<sup>8</sup>

More specifically, an impressive amount of economic data supports the judgment that concentration of more than 50 per cent of an industry's sales in four or fewer firms (*i.e.*, a "tight oligopoly") gives rise to conduct and performance which approximate that of a monopolist or well-disciplined cartel.<sup>9</sup> This degree of concentration destroys the incentive for independent decisions on price and output, and encourages instead the development of "oligopolistic interdependence," a recognition that the profits of each firm are dependent on the decisions of each of the others.<sup>10</sup> As a result, these few firms collectively eschew price and product competition in favor of "joint-profit maximization": output is restricted and prices are set above competitive levels, albeit in a noncollusive fashion.<sup>11</sup> In effect, the industry is "collectively monopolized."<sup>12</sup>

Barriers to entry comprise the second structural criteria for evaluating industrial competition. Leading firms in a tight oligopoly can set higher-than-competitive prices and reap monopoly profits only if they are able to deter new entrants whose added output would push prices back to a competitive level.<sup>13</sup> The effectiveness of these barriers is reflected generally by the persistence of high concentration levels.<sup>14</sup>

8. See, e.g., Erickson, *The Economics of Price Fixing*, 2 ANTIT. LAW & ECON. REV. 94 (Spring 1969); Mueller, *supra* note 2, at 90-91; Weiss, *Average Concentration Ratios and Industrial Performance*, J. OF INDUS. ECON. (July 1963); Collins & Preston, *Concentration and Price Margins in Food Manufacturing Industries*, J. OF INDUS. ECON. 226 (July 1966); Stigler, *A Theory of Oligopoly*, 72 J. POL. ECON. 41 (1964); Mann, *Seller Concentration, Barriers to Entry, and Rates of Return in Thirty Industries, 1950-1960*, REV. OF ECON. & STAT. 296-307 (August 1966). See generally Machlup, *Oligopoly and the Free Society*, 1 ANTIT. LAW & ECON. REV. 11 (July-August 1967). A voluminous compilation of economic studies concerning the effect of high industry concentration on market competition and performance is contained in  *Hearings on Economic Concentration, Before the Subcomm. on Antitrust and Monopoly of the Senate Comm. on the Judiciary*, 89th Cong., 1st Sess. (1965).

9. Mueller, *supra* note 2, at 116-117.

10. *Id.* at 112-16. Galbraith refers to this form of price and output behavior as "oligopolistic rationality." *Hearing on Planning, Regulation and Competition in the New Industrial State, Before Subcomm. of the Select Comm. on Small Business*, 90th Cong., 1st Sess. 8 (1967). In ruling on mergers, the Supreme Court has acknowledged the problem of mutual interdependence in highly concentrated industries. It has noted that as industries become more highly oligopolistic "... the greater is the likelihood that parallel policies of mutual advantage, not competition, will emerge." *United States v. Aluminum Co. of America*, 377 U.S. 271, 280 (1964).

11. KAYSER & TURNER, *supra* note 1, at 105; Mueller, *supra* note 2, at 114-16. See also REPORT OF THE WHITE HOUSE TASK FORCE ON ANTITRUST POLICY 3 (released May 21, 1969) [hereinafter cited as THE NEAL REPORT].

12. Mueller, *supra* note 2, at 115.

13. See CAVES, *supra* note 2, at 22-23; note 3 *supra*. Established firms in persistently concentrated industries have accomplished this by erecting obstacles that impose on newcomers higher costs per unit than those encountered by firms already in the industry. Mueller, *supra* note 2, at 89 n.7.

14. Thus, it has been suggested that where an industry's concentration ratio has been at

More precise measurements of entry barriers, however, have been developed. Empirical investigations reveal that large economies of scale, high promotional expenditures, and enormous capital requirements are powerful deterrents to new entry.<sup>15</sup> If an industry is surrounded by any one of these barriers, the possibility of new entry is substantially reduced. If it is protected by all three, entry is "effectively blockaded."<sup>16</sup> By preserving tight oligopolies from the deconcentration which would result if new firms were able to enter, barriers of such magnitude contribute to anticompetitive conduct and unsatisfactory performance.

Accordingly, some antitrust economists now urge divestiture of leading firms in industries with 4-firm concentration ratios of 50 per cent or more and with barriers which all but foreclose new entry.<sup>17</sup> They contend that deconcentrated industries would behave more competitively in making price and output decisions and would perform more satisfactorily by providing consumers with lower prices, reduced production and distribution costs, and an accelerated rate of technological innovation. In short, they argue that a larger number of competitors would provide a greater degree of competition.

**B. *Legal Criteria: The Gap Between Economic Reality and Antitrust Laws in the Automobile Industry***

As measured by either of the structural economic criteria, automobile manufacturing is one of the least competitive industries in the American economy. Its structural concentration is unprecedented. Ninety-seven per cent of domestic production is centered in three firms; four firms account for all passenger vehicles produced in this country.<sup>18</sup>

70 per cent or more for 7 of the past 10 years, substantial barriers can be presumed. THE NEAL REPORT, *supra* note 11, at 5-7, 15. *But see* Brozen's criticism that the NEAL REPORT fails to deal explicitly with entry barriers. *The Antitrust Task Force*, 13 J. LAW & ECON. 279, 284 (1970).

15. *See generally* BARRIERS, *supra* note 3. In his intensive survey of 20 American industries, Professor Bain for example found that entry was extremely unlikely in concentrated industries with significant economies of scale up to 5 per cent or more of national sales volume *Id.* at 81. Tremendous promotional expenditures which compel newcomers to outspend established firms by an additional 5 per cent of unit retail price in countervailing promotion represented a further impediment to new competition *Id.* at 127. Moreover, when the initial capital required for entry into an industry at an efficient level of production and distribution exceeded \$100 million, entry was highly improbable, *Id.* at 158.

16. Mueller, *supra* note 2, at 124. *See* BARRIERS, *supra* note 3, at 170.

17. *See, e.g.,* KAYSER & TURNER, *supra* note 1, at 266-72; Smith, *supra* note 2, at 20-21. Other economists set the critical 4-firm concentration ratio for divestiture purposes at 70 percent. THE NEAL REPORT, *supra* note 11, 12-15.

18. STANDARD & POOR, INDUSTRY SURVEYS: Autos—Basic Analysis (October 1, 1970) at A161. The market shares by producers for 1969 were as follows: General Motors—53.7%, Ford—26.3%, Chrysler—16.9%, American Motors—3.0%. Although generally not considered a passenger car producer, Checker Motors accounted for the 0.1% remainder of 1969 production. *Id.* The Big Three continued to hold 96.6% of the market during the first half of

## Automobile Industry

This degree of concentration is twice that generally considered inimical to competitive conduct and performance.<sup>19</sup> Moreover, the condition of entry into automobile production has been described as "effectively blockaded."<sup>20</sup> Concentration has exceeded the 70 per cent threshold for presumptively high barriers to entry not only for 7 of the past 10 years, but for each of the past 40 years.<sup>21</sup> More precisely, the industry strikingly exhibits the indicia of high barriers to entry: large economies of scale, high promotional expenditures, and enormous capital requirements.<sup>22</sup>

Given its anticompetitive structure, the anticompetitive nature of the automobile industry's conduct and performance is not unexpected. In fact, the Big Three interdependently engage in price and product conduct which has the same anticompetitive impact as if it had been collusively planned.<sup>23</sup> As a result, the industry is said to exhibit the indicia of unsatisfactory market performance: inflated selling costs, product imitation, higher-than-competitive prices, collusive suppression of technological innovation, and persistently high rates of return.<sup>24</sup>

1970. STANDARD & POOR, *INDUSTRY SURVEYS: Autos—Current Analysis* (August 13, 1970) at A152.

19. See note 9 *supra*.

20. L. WEISS, *ECONOMICS AND THE AMERICAN INDUSTRY* 375 (1966). Bain concludes that obstacles to entry into the industry are "insuperable." INDUSTRIAL ORGANIZATION, *supra* note 2, at 287. Economists Schupack and Carroll describe the wall surrounding the automobile industry as "insurmountable" and "impregnable," respectively. *Hearings before Subcomm. of the Senate Select Comm. on Small Business on Planning, Regulation, and Competition in the American Industry*, 90th Cong. 2d Sess. 907, 920 n.6 (1968) [hereinafter cited as *1968 Hearings*]. But see note 124 *infra*.

21. The Big Three (GM, Ford and Chrysler) have accounted for more than 70 percent of industry sales since 1929. FEDERAL TRADE COMMISSION, *REPORT ON THE MOTOR VEHICLE INDUSTRY* 29 (1939) [hereinafter cited as *FTC REPORT*]; *AUTOMOTIVE NEWS, ALMANAC ISSUES*, for each of the years since 1937.

22. Economies of scale in this industry require that, merely to survive, a firm must capture from 4 to 8 per cent or more of total sales. These percentages were derived from Bain's minimum scale economy estimates of 300,000–600,000 unit production per year, as applied to 1969 industry sales of 8.38 million. INDUSTRIAL ORGANIZATION, *supra* note 2, at 286; STANDARD & POOR, *supra* note 18, at A159. This scale economy disadvantage was found by Bain to be one of the most formidable of its kind in American industry. See note 15 *supra*. Promotional losses, resulting particularly from price concessions necessary to maintain a solvent national dealership system, would likely average at least 5 per cent of factory price over the first 5 to 10 years. INDUSTRIAL ORGANIZATION, *supra* note 2, at 285–86. This represents the severest of promotional disadvantages revealed in Bain's studies. See note 15 *supra*. The absolute minimum amount of capital required for efficient production and distribution has been estimated at \$779 million, or more than 7 times larger than the amount considered by Bain as making entry highly improbable. See note 15 *supra* and p. 588 *infra*. Significantly, not a single firm has entered the automobile industry since 1923. See generally Vatter, *The Closure of Entry in the American Automobile Industry*, 4 OXFORD ECON. PAPERS 213 (1952).

23. See, e.g., BARRIERS, *supra* note 3, at 216; Galbraith, *supra* note 10, at 8.

24. See WEISS, *supra* note 20, at 350–68; Lanzillotti, *The Automobile Industry*, in W. ADAMS, *THE STRUCTURE OF AMERICAN INDUSTRY* 338–46 (1961); Loescher in *1968 Hearings*, *supra* note 20, 913–17. The industry's protective imitation of product designs has been underscored by BAIN in INDUSTRIAL ORGANIZATION 425; Lanzillotti, *supra* at 329–30. Its failure to develop durable and pollution-free vehicles is emphasized in J. ESPOSITO, *VANISHING AIR*:

Just from available data, a strong presumption arises that in structure, conduct and performance, the automobile industry is, at least by comparison to other industries, markedly anticompetitive. Yet, it has escaped antitrust prosecution. It seems to represent, therefore, a striking example of the gap which exists between economic reality and antitrust remedies.

Unlike antitrust economic theory, the antitrust laws focus on the behavioral rather than structural element of the structure-conduct-performance triad. They are primarily concerned with outlawing offensive business conduct rather than with striking down anticompetitive structures which produce unsatisfactory performance.<sup>25</sup> Thus, the Sherman Act proscribes not structural monopoly but collusive activities "in restraint of trade" and activities that tend to "monopolize" trade.<sup>26</sup> Economists and antitrust officials generally agree, however, that while the Big Three's price and output conduct has an impact effectively equivalent to that of a Sherman Act conspiracy, these decisions are

THE NADER REPORT ON AIR POLLUTION ch. 2 (1970); and by Sen. Nelson in *Hearings on the Role of Giant Corporations Before the Subcomm. on Monopoly of the Senate Select Comm. on Small Business*, 91st Cong. 1st Sess. 538-39 (1969) [hereinafter cited as 1969 *Hearings*]. See also the complaint filed by the Antitrust Division of the Department of Justice in January of 1969 charging that the Big Three had conspired in violation of section 1 of the Sherman Act to suppress the development of automotive emission control devices. *United States v. Automobile Mfrs. Ass'n, Inc.* (D. Cal. January 10, 1969). A consent decree was entered enjoining the conspiracy in October, 1969 Trade Cases ¶ 72,907. But fifteen states subsequently have sued *parens patriae* in the Supreme Court asking for a mandatory injunction compelling the auto makers to develop a pollution-free engine at the earliest possible date. *State of Washington v. General Motors*, 5 TRADE REG. REP. ¶ 50,285, at 55,613 (August 17, 1970). Indeed, within the past few months GM, Ford and Chrysler have joined in a major counter-attack against government agencies and consumer protection groups which complained that the industry was refusing to produce safer, pollution-free cars. Ford, for example, has sent brochures which term automotive air pollution a myth to its 7,000 dealers for redistribution to the public. Similarly, Chrysler has sent its chief emission expert around the country to argue that the elimination of automotive emissions "cannot be justified during most of this decade." N.Y. Times, November 18, 1970, at 6, col. 1. Meanwhile, GM has set a new trend in automotive safety by seeking a court injunction against a Department of Transportation recall order regarding serious safety defects in the wheels of 200,000 GM pickup trucks. NEWSWEEK November 23, 1970, at 112. But see recently enacted federal legislation encouraging the production of pollution-free automobiles. Pub. L. No. 91-604 (Dec. 31, 1970).

25. Mueller, *supra* note 2, at 105-06; Smith, *supra* note 2, at 41. It has been suggested, however, that the Supreme Court's merger opinions since 1962 reflect a growing judicial acceptance of the critical role of market structure. Brodley, *Oligopoly Power Under the Sherman and Clayton Acts—From Economic Theory to Legal Policy*, 19 STAN. L. REV. 285, 298 (1967). See, e.g., *Brown Shoe Co. v. United States*, 370 U.S. 294 (1962); *United States v. Philadelphia Nat'l Bank*, 374 U.S. 321 (1963); *United States v. Aluminum Co. of America*, 377 U.S. 271 (1964); *Federal Trade Commission v. Procter & Gamble Co.*, 386 U.S. 568 (1967). The influence of the "structuralist" approach in the merger area can also be seen in the heavy reliance placed on concentration ratios in enforcement guidelines by the Department of Justice and the Federal Trade Commission.

26. 15 U.S.C. §§ 1, 2 (1964).

## Automobile Industry

made interdependently, without any evidence of collusion.<sup>27</sup> Moreover, although the exclusion of nearly a hundred earlier producers and erection of insurmountable barriers to new entry were as effective as the conduct of a predatory monopolist, this result could not provide the basis for a Sherman Act charge of monopolization absent the emergence of a single monopoly firm.<sup>28</sup> Similarly, the Clayton Act reaches mergers or coercive practices such as exclusive dealing and tying arrangements.<sup>29</sup> Although the Big Three's conduct is analogous in anti-competitive impact to these forbidden practices, it is again distinguishable by its lack of agreement.<sup>30</sup>

For years, antitrust commentators have sought to stretch existing antitrust doctrine to reach the presumed anticompetitive aspects of the automobile industry. Professors Turner and Posner, for example, have argued that "agreement" under the Sherman Act might include or be redefined to include interdependent though non-collusive behavior by jointly-acting oligopolists.<sup>31</sup> The broadest reading of conspiracy law holdings under the Sherman Act, however, would not permit such an elastic interpretation of agreement.<sup>32</sup>

Alternatively, Professors Turner and Sherwood have suggested that since the Sherman Act looks to substance rather than form, the conduct of jointly-acting oligopolists should be treated as that of a single monopolist when their effects are almost identical. Thus, they have urged that where oligopolists effectively "share monopoly power" and engage in predatory or exclusionary practices, they might be charged with having monopolized in violation of the Sherman Act.<sup>33</sup> Significantly, however, neither Turner nor Sherwood could cite a single

27. WEISS observes, for example, that the automobile industry "avoids formal collusion" and that "[t]here is no evidence that blockaded entry was intentionally sought by members of the industry," *supra* note 20, at 375; BARRIERS, *supra* note 3, at 216.

28. *But see* note 33 *infra*.

29. 15 U.S.C. § 15 (1964).

30. *See* pp. 605-07 *infra*.

31. Posner argues that noncompetitive oligopoly pricing behavior results from "tacit collusion" which can be proceeded against under section 1 of the Sherman Act. *Oligopoly and the Antitrust Laws: A Suggested Approach*, 21 STAN. L. REV. 1562 (1969). Turner urges that although interdependent oligopoly pricing should not be prosecuted under section 1, interdependent oligopoly nonpricing conduct is arguably reachable under that section. *The Definition of Agreement Under the Sherman Act*, 75 HARV. L. REV. 655, *esp.* at 677-84 (1962).

32. Although Turner interprets conspiracy language in *Interstate Circuit, Inc. v. United States*, 306 U.S. 208 (1939), as reasonably including interdependent conscious parallelism, note 31 *supra* at 683, no subsequent antitrust decision has so held. *See also* A. NEALE, *THE ANTITRUST LAWS OF THE UNITED STATES* 171-72, 180-82, 445-46 (1960).

33. Turner, *Economic Regulatory Policies*, 82 HARV. L. REV. 1207, 1225-31 (1969); Sherwood, *Separate Statement: White House Task Force Report*, 2 ANTIT. LAW & ECON. REV. 61 (Winter 1968-69). *See also* S. Smith, *supra* note 2, at 58.

precedent in support of their argument. Indeed, after considering both these approaches, a recent White House Task Force on Antitrust Policy rejected them and concluded that competition in highly concentrated industries could probably only be restored by enactment of new legislation empowering courts to dissolve leading firms in entrenched oligopolies.<sup>34</sup>

With respect to restoring competitive structure and performance to the automobile industry, however, there may be a viable alternative to either stretching the Sherman or Clayton Acts beyond the limits of precedent or relying upon new structural, antitrust legislation. A particular form of conduct, annual style change, may have largely determined this industry's anticompetitive structure and may as a result constitute an "unfair method of competition" under Section 5 of the Federal Trade Commission Act.<sup>35</sup> The Sherman and Clayton Acts, to be sure, proscribe several kinds of specific business behavior such as mergers and predatory or exclusionary practices by a dominant firm which can severely alter the structure of an industry, rapidly transforming an unconcentrated competitive structure to a concentrated oligopolistic one.<sup>36</sup> They fail, however, to reach other forms of "concentration-increasing" conduct which may amass most of an industry's total sales within a few firms and erect formidable entry barriers to newcomers.<sup>37</sup> Arguably, annual style change is conduct of this latter variety and should be condemned as "unfair" under Section 5.

The primary purpose of this Note, therefore, is to suggest strongly that the three leading firms in the automobile industry have engaged in conduct—annual style change—which ultimately transformed a competitive structure to an anticompetitive oligopolistic one in violation of Section 5 of the Federal Trade Commission Act. By way of a preliminary economic analysis, this Note will argue that annual style change has drastically increased market concentration, raised impenetrable barriers to entry, and directly contributed to this industry's record of noncompetitive market performance. Then, by analogizing the anticompetitive impact of annual style change to recognized anti-

34. The White House Task Force proposed a new statute, the "Concentrated Industries Act," which would prohibit any market structure in which, for a prescribed period of years, four or fewer firms had an aggregate market share of 70 per cent or more and industry sales exceeded \$500 million. Relief would take the form of dissolution to the point where no single firm would hold more than 12 per cent of total sales. THE NEAL REPORT, *supra* note 11.

## Automobile Industry

trust violations, as Section 5 cases seem to require, a *prima facie* case of illegality under Section 5 will be established.

What follows, however, is no substitute for a full-scale economic investigation and legal assessment of this practice by the FTC. Rather this Note is designed to suggest on the basis of available evidence the anticompetitive implications of annual automobile style change and the compelling need for the FTC to undertake a more thorough inquiry of the possible illegality of annual automobile style change under Section 5 of the FTC Act.

### II. Economic Impact of Annual Style Change in the Automobile Industry: A Preliminary Analysis

Before analyzing the anticompetitive impact of annual style change on structural concentration and barriers to entry and its impairment of this industry's competitive market performance, a distinction between style change and performance modifications must be drawn. As complex pieces of machinery, automobiles present manufacturers with practically unlimited opportunities for physical product modification in both appearance and performance. Their appearance may be drastically altered by varying the amounts of chromium and contour trim, changing the body shell patterns and radiator grill designs, and altering the range of colors and interior textures.<sup>38</sup> Their performance may be modified by structural changes which affect safety, durability, economy, reliability, carrying capacity, maneuverability, comfort, and convenience.

In this Note, "style changes" will refer solely to alterations in the appearance, as contrasted with modifications in the performance, of automobiles.<sup>39</sup> It is not unrealistic to distinguish style from performance changes, since the Bureau of Labor Statistics in the U.S. Department of Labor has for many years made this determination in compiling official consumer price indexes. Specifically, the BLS employs detailed

38. J. KEATS describes this process pithily:

The basic shell is bent a little bit this way, this year, and is bent slightly that way next year. The headlights are higher one year, lower the next, or grow in double . . . The door knobs are hidden, or recessed, or turned into buttons or bars . . . Tail fins grow higher, or maybe, grow in sidewise.

THE INSOLENT CHARIOTS 54-55 (1958). Annual style change may be accomplished either by altering existing models or by annually introducing "entirely new" model lines.

39. This distinction is not always easily drawn. E.g., has the migration of the gear shift from floor to steering column and, recently, back to floor again affected performance or appearance? INDUSTRIAL ORGANIZATION, *supra* note 2, at 423-24.

criteria for evaluating annual automobile model changes in order to adjust quoted prices of new automobiles for changes in "quality." In making these quality adjustments, it is compelled to distinguish between structural changes which affect safety, reliability, durability, economy, and comfort and "[s]tyle, or changes in appearance design solely to make the product seem new or different."<sup>40</sup> The BLS adjusts new automobile prices only for changes of the former variety.<sup>41</sup> Thus, a distinction between style and performance changes would appear to be empirically justifiable.

Annual model change has presumably consisted of both style changes and performance modifications. The industry's persistent refusal to provide inquiring Congressional committees with cost data, however, precludes a precise dichotomy between annual expenditures for style as contrasted with expenditures for performance alterations.<sup>42</sup> Nonetheless, several economists have testified that annual model change is predominantly oriented to changes in style rather than improvements in performance.<sup>43</sup> Indeed, they emphasize that, before the 1920's, models were changed every few years to incorporate significant technological breakthroughs, but that since then the rate of technological progress has declined while model changes have become an annual phenomenon.<sup>44</sup> Of course, the performance of automobiles has improved since the 1920's, but arguably not at a rate justifying annual model change. For example, in 1969, the Big Three spent \$1.56 billion or about \$195 per automobile to change its models; the Bureau of Labor Statistics reported, however, a net reduction in performance improvements of \$—3 per automobile, or approximately \$—23.9 million for the Big Three's combined output. Consequently, they spent more than a billion and a half dollars to make their 1969 models seem "new and different" in appearance. BLS performance data, computed for every model year since 1968, moreover, indicated that the 1969 results were not exceptional. The value of performance improvements in 1968 through 1971 models averaged \$5.50 per automobile each year, or less than 3 per cent of the Big Three's total model change expenditures

40. U.S. DEPARTMENT OF LABOR, BUREAU OF LABOR STATISTICS, GUIDELINES FOR ADJUSTMENT OF NEW AUTOMOBILE PRICES FOR CHANGES IN QUALITY OF PRODUCT (July 19, 1968).

41. The BLS does make adjustments, however, for those style changes previously offered as options and purchased by the majority of consumers, *id.* Presumably, this exception allows for explicit consumer preference.

43. SENATE SUBCOMM. ON ANTITRUST AND MONOPOLY OF THE COMM. ON THE JUDICIARY, STUDY OF ADMINISTERED PRICES IN THE AUTOMOBILE INDUSTRY, 85th Cong., 2d Sess. 81-87 [hereinafter cited as ADMINISTERED PRICES]; Lanzillotti, *supra* note 24, at 342-43.

44. ADMINISTERED PRICES, *supra* note 43, at 81-87; Lanzillotti, *supra* note 24, at 342-43.

## Automobile Industry

during that period.<sup>45</sup> In short, it would be reasonable to assume that annual model change has consisted primarily of changes in styling characteristics.

### A. *Style Change as a Market Weapon for Achieving Concentrated Economic Power*

The trend toward concentration in the automobile industry is unequalled in the history of American manufacturing.<sup>46</sup> From the inception of this industry in the late 1890's, the number of independent producers grew steadily to a peak of 88 in 1921.<sup>47</sup> Then, suddenly, about 1923, the number of automobile producers began to decline rapidly. In the course of three years, from 1923 to 1926, 43 firms left the market.<sup>48</sup> By 1935, only 10 firms were producing automobiles.<sup>49</sup> Today, 4 producers remain, with 3 firms accounting for 97 per cent of all domestic car production.<sup>50</sup>

Economists generally agree that four factors were primarily responsible for the rapid demise of competitors since the 1920's: components integration, large-scale advertising, franchised distribution, and a tremendous increase in capital requirements.<sup>51</sup> Arguably, these four decisive factors resulted from the development of an even more fundamental industry practice: annual style change. Significantly, it was in 1923, a near high-water mark in terms of the number of active

45. 1969 combined retooling figure for the Big Three obtained from STANDARD & POOR, *supra* note 18, at A170. Their combined output amounted to 7.98 million units in 1969. *Id.* at A161. The BLS reported a net performance increase in the 1969 models of \$1 which included, however, a \$4 expenditure to meet higher federal safety standards. Non-mandated performance changes, therefore, amounted to \$-3. U.S. DEPARTMENT OF LABOR PRELIMINARY REPORT ON PRICES OF NEW PASSENGER CARS, USDL-9994 (October 7, 1969). Per unit average performance improvement figure of \$5.50 for model years 1968-71 derived from the following BLS data: 1968 (Statement of Peter Henle, Chief Economist, Bureau of Labor Statistics, in *Prices of Motor Vehicle Safety Equipment, Hearings Before the Subcomm. on Executive Reorganization, of the Senate Comm. on Government Operations*, 90th Cong., 2nd Sess. 122-24 (1968)); 1969 (USDL-9994, October 7, 1969); 1970 (USDL-10-818, November 18, 1969); 1971 (USDL-11-535, November 6, 1970). Given annual sales by the Big Three at about 8 million units and average model change expenditures at about \$1.5 billion per year for the 1968-71 period, a \$5.50 performance increase represents 2.9 per cent of estimated total model change costs (8 mil.  $\times$  \$5.50/\$1.5 bil. = 2.9%). See also Ralph Nader's criticism that as a result of industry pressures the BLS overstates quality improvements and that industry expenditures attributed to safety features actually include the costs of styling changes. *Prices of Motor Vehicle Safety Equipment, supra*, at 60-70.

46. Lanzillotti, *supra* note 24, at 312.

47. R. EIRSTEN, *THE AUTOMOBILE INDUSTRY* 176 (1928). The depression of 1921-1922 and consequent decline in automobile demand brought this figure down to 83 by the end of 1922. *Id.* at 176, 187.

48. *Id.* at 176.

49. ADMINISTERED PRICES, *supra* note 43, at 8-9.

50. See note 18 *supra*.

51. See, e.g., WEISS, *supra* note 20, at 331-32, 336-39; Lanzillotti, *supra* note 24, at 321-34; Vatter, *supra* note 22, at 224-27.

automobile producers, that General Motors introduced annual change.<sup>52</sup> By 1928, it had become the industry practice.<sup>53</sup>

Prior to the introduction of annual style change in 1923, entry into the automobile industry was relatively easy, exits were insubstantial in number, and concentration was consequently low.<sup>54</sup> Scale economies in components integration provided no significant deterrent to the large number of early entrants to this industry.<sup>55</sup> Similarly, entry was not precluded by a need to engage in massive advertising.<sup>56</sup> Moreover, the availability of standardized interchangeable replacement components up until the 1920's obviated any need for integration forward into extensive networks of franchised dealers with specialized maintenance capabilities.<sup>57</sup> Thus, capital requirements for entry prior to the 1920's were negligible. The industry's emphasis upon external economies of independent parts manufacturers rather than internal scale economies of integrated fabrication, for example, greatly reduced the amount of initial investment required for operation.<sup>58</sup> The Ford

52. A. SLOAN, MY YEARS WITH GENERAL MOTORS 167 (1964); L. SEITZER, A FINANCIAL HISTORY OF THE AUTOMOBILE INDUSTRY 212 (1928). See also GM's account of its introduction of a "new dynamic product concept" in the early 1920's, i.e., annual style change. GENERAL MOTORS, THE AUTOMOBILE INDUSTRY: A CASE STUDY IN COMPETITION 4-7 (1968).

53. Menge has argued that since the mid-1920's "[s]lowly and inexorably a code of behavior based upon rapid periodic style change" drove "the small producers from the industry." *Style Change Costs as a Market Weapon*, 76 Q.J. OF ECON. 632, 634 (1962).

54. See generally Lanzillotti, *supra* note 24, at 314. In 1915, 3-firm concentration stood at approximately 50 per cent. FTC REPORT, *supra* note 21, at 29. In only one year (1910) did the rate of failure greatly exceed the rate of entry. It has been argued that this deviation from an otherwise uniformly positive entry-exit ratio up until the early 1920's was due to the refusal by many producers to change from 1- and 2-cylinder engines to the 4-cylinder version. ADMINISTERED PRICES, *supra* note 43, at 4.

55. INDUSTRIAL ORGANIZATION, *supra* note 2, at 296. Automobile producers were primarily "assemblers" of bodies and engines purchased from firms specializing in automotive parts production. *Id.*; Vatter, *supra* note 22, at 216-17. Since producers had access to parts from external suppliers, they were not compelled to integrate backward into components production. Consequently, most of them engaged exclusively in assembly operations, which required only minimal levels of output for optimal efficiency (i.e., lowest per unit production costs). INDUSTRIAL ORGANIZATION, *supra* note 2, at 296.

56. Since the designs of most automobiles produced before 1923 remained basically unchanged for substantial periods of time, the public became familiar with them. Thus, there was little to be gained by repeatedly calling the public's attention to the outstanding features of unchanged models. See generally ADMINISTERED PRICES, *supra* note 43, at 96. Total magazine advertising expenditures by all passenger car manufacturers in 1915, for instance, amounted to less than \$3 million. ERSTLIN, *supra* note 47, at 147.

57. In fact, automobile manufacturers during this period generally distributed their products to independent wholesalers and retailers who resold to the public. FTC REPORT, *supra* note 21, at 106-10.

58. Engaged only in the assembly and sale of completed vehicles, early producers were therefore able to shift the financial burdens of automobile production to owners of already existing capital equipment: the specialized parts manufacturers. SEITZER, *supra* note 32, at 19; Lanzillotti, *supra* note 24, at 314. The assemblers were able to reduce their capital requirements further by purchasing parts on credit and then selling cars to dealers on a cash basis. SEITZER, *supra* note 32, at 20-21; FTC REPORT, *supra* note 21, at 108. Many of these firms were able to lower start-up costs even further by leasing rather than purchasing assembly facilities. Vatter, *supra* note 22, at 217.

## Automobile Industry

Motor entry was typical. The Company was incorporated in 1903 with only \$28,000 in cash.<sup>59</sup> This ease of entry was reflected in industry concentration. Not until the 1920's did the three leading firms account for much more than half of total sales.<sup>60</sup>

Product variation was not new to the automobile industry in 1923. From the very beginning, it had served as a key element of competition among the many early producers.<sup>61</sup> But pre-1923 variations differed from subsequent product changes in two significant ways: they occurred less frequently, and they generally represented substantial improvements in performance capabilities rather than mere changes in style.<sup>62</sup> Thus, before 1923, the frequency of model change was closely geared to the rate at which technological breakthroughs were achieved; these occurred every four or five years.<sup>63</sup> Moreover, it will be demonstrated that this rate of product change enabled independent parts manufacturers to supply small volume assemblers with efficiently produced and improved components. The advent of annual product variation, however, drastically altered this process.

In 1923, General Motors introduced annual style change.<sup>64</sup> Whether by design or mere accident, GM's device accomplished much more than planned obsolescence: it eliminated smaller producers unable or unwilling to restyle their products every year. As the first company to employ this market weapon, GM increased its share of total industry sales dramatically from 13 to 43 per cent in the 5 years between 1922 and 1927.<sup>65</sup> Chrysler, after its well-financed entry in 1923, quickly imitated GM's restyling policy and increased its market share to 6 per cent by 1927.<sup>66</sup> Ford, at first ignoring the practice of changing styles annually,

59. Of the \$100,000 in stock originally subscribed to by a dozen people, \$72,000 was paid in the form of patents, machinery and supplies. *SLUTZKE, supra* note 52, at 88 n.5.

60. *ERSTEIN, supra* note 47, at 163-64, 176. Three-firm concentration derived from FTC REPORT, *supra* note 21, at 29. In 1911, General Motors and Ford accounted for only 38 per cent of passenger car production. By 1929, they shared 64 per cent of sales, and together with Chrysler (which entered in 1923), 72 per cent of the industry. *Id.*

61. See, e.g., *ERSTEIN, supra* note 47, at 87-93; Lanzillotti, *supra* note 21, at 314-15.

62. See p. 576 *supra*. There was a substantial variation in performance alternatives prior to 1923. In 1910, for example, consumers could choose among electric, steam and gasoline vehicles, which offered widely divergent performance capabilities. Among gasoline powered cars, for instance, there were one, two, three, four and six cylinder engines available. *ERSTEIN, supra* note 47, at 87-88; *SLUTZKE, supra* note 52, at 18.

63. See notes 43-44 *supra*. See also *WISS, supra* note 20, at 312-43.

64. By 1920, the demand for new automobiles had been largely saturated and had become a replacement demand initially sensitive to the alternative supply of used cars and costs of repairs. Accordingly, price reductions were less effective in generating increased purchases as new car demand became less elastic. *WISS, supra* note 20, at 332-34; Vatter, *supra* note 22, at 218. A new market device was required to coax additional purchases from consumers by persuading them that their present cars were obsolete.

65. Computed from data contained in *SLUTZKE, supra* note 52, at 213; FTC REPORT, *supra* note 21, at 29; Lanzillotti, *supra* note 24, at 319.

66. FTC REPORT, *supra* note 21, at 29; 549-51. Chrysler's successful entry was a function

suffered an equally dramatic decline in its market share during this same period, falling from 51 per cent in 1922 to 9 per cent by 1927.<sup>67</sup> In 1928, it adopted an annual restyling policy which within two years boosted Ford's share of the market to 31 per cent.<sup>68</sup> While aggressively pursuing annual style change, G.M., Chrysler and Ford increased their collective share of industry sales from less than 65 per cent in 1923 to more than 90 per cent by 1935.<sup>69</sup>

An inevitable result of the drive to produce "all-new" cars annually was an industry trend toward components integration. Previously, producers had attained optimal efficiency at low output volumes by assembling basically interchangeable body and engine components purchased from external suppliers.<sup>70</sup> By contrast, after 1923 the annual need to produce uniquely styled vehicles, including redesigned bodies and rearranged (although not necessarily improved) engines, caused producers to integrate body and engine production within their own plants.<sup>71</sup>

This shift from assembly of body and engine components to their integrated fabrication had a substantial impact upon the scale of production necessary for optimum efficiency as measured in terms of lowest per unit production costs. For a firm engaged in both mass production and assembly of annually modified bodies and engines, the optimal output was from 3 to 5 times greater than that required for mere assembly operation.<sup>72</sup> After 1923, an integrated firm which changed its styles annually needed a volume of at least 250,000 cars

both of its sizeable financial resources and its early acquisition of a large integrated plant and powerful dealer organization. Weiss, *supra* note 20, at 338.

67. Lanzillotti, *supra* note 24, at 319; FTC REPORT, *supra* note 21, at 29.

68. BARRIERS, *supra* note 3, at 298 (1962). Ford had frozen the design on its "Model T" since 1909 and had concentrated its energies on mass production at low cost. Until the early 1920's, its efforts were completely successful as measured by its increase in market share from 9 per cent in 1909 to 55 per cent in 1921. With the introduction of its "Model A" in 1928, Ford managed briefly to regain its leading position in 1929-30; but then GM took and kept the lead thereafter. SELTZER, *supra* note 32, at 120-24; Lanzillotti, *supra* note 24, at 318-20.

69. FTC REPORT, *supra* note 21, at 29.

70. As significant technological breakthroughs were achieved, performance modifications had been made by ordering from independent components manufacturers specially-tooled parts which were then added to the basic body and engine assemblies. See Lanzillotti, *supra* note 24, at 314; Vatter, *supra* note 22, at 216-17.

71. This is not intended to suggest that all backward integration occurred after 1923. On the contrary Ford through internal growth and General Motors by merger had early begun integration of components production. See SELTZER, *supra* note 32, at Ch. 3 and 4. What it does imply, however, is that whereas before 1923 components integration did not affect entry or survival conditions appreciably, after 1923 it became an absolute necessity. Consult INDUSTRIAL ORGANIZATION, *supra* note 2, at 296.

72. The critical stage in plant economies is found in the production of body and engine components, not in assembly operations. Optimal size for assembly purposes ranges from 60,000 to 180,000 units per year. Integrated optimal production scale requires volumes of from 300,000 to 600,000 units per year. BARRIERS, *supra* note 3, at 245.

## Automobile Industry

a year to operate at maximum efficiency.<sup>73</sup> At lower outputs, it would experience production costs substantially higher than larger volume producers.

One of the most serious disadvantages for producers operating at below the optimal scale of output required for style changes was the premature scrapping of expensive tools and dies. Assume, for example, that prior to 1923 General Motors and firm X in Figure I had identical

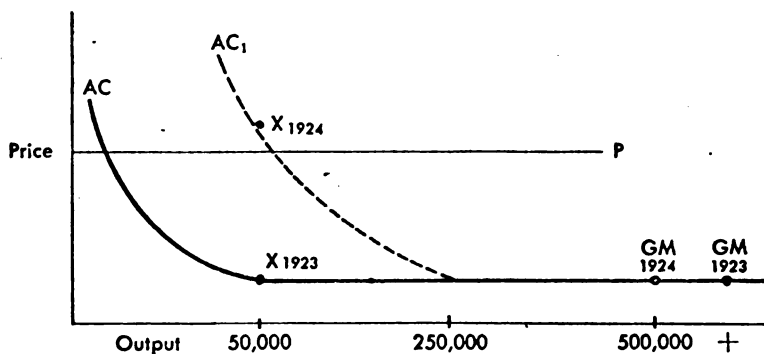

FIGURE I

cost curves (AC) but dissimilar outputs.<sup>74</sup> GM's production exceeded 400,000 units; while firm X produced a little more than 50,000 vehicles a year. Both producers, therefore, had achieved the minimum level of output necessary for optimally efficient assembly operations (50,000 units in 1923). Assume also that prices were constant at  $p$ .

In 1923, when it initiated annual style change, GM purchased at great expense the special tools and dies required for completely restyling its products. It found, however, that after the production of approximately 250,000 cars this equipment was physically deteriorated and could be fully amortized.<sup>75</sup> In 1923, it exhausted three full sets of dies and tools in producing a record 775,000 automobiles (point GM<sub>1923</sub> in Figure I).<sup>76</sup> Thus, it could replace the 1923 dies and tools

73. Estimate by Paul Hoffman of Studebaker Corp., 21 TNEC HEARINGS 11218 (1941).

74. This graphic analysis draws heavily from Menge, *supra* note 53, at 634-43.

75. The average life of dies and special tools during this period approximated 250,000 units. See note 73 *supra*. Of course, if GM had produced 300,000 cars that year, it would have only partially exhausted a second set of equipment. Nonetheless the premature scrapping costs could have been spread over a larger volume of automobiles than if it had produced less than 250,000. Hence, its per unit scrapping costs would have been substantially lower if it exceeded rather than fell below this production level.

76. General Motors output amounted to 442,981 units in 1922; 774,617 in 1923. EPSTEIN, *supra* note 47, at 328.

with identical equipment or, at no extra cost, with dissimilar equipment. Consequently, GM changed the style characteristics of its 1924 models without increasing its costs, thereby remaining on AC in Figure 1 (point  $GM_{1924}$ ).

In order to compete with GM's restyled 1923 models, firm X also purchased the expensive tools and dies necessary for the integrated production of uniquely styled vehicles. But unlike GM, it was unable to amortize this equipment over a year's production. Since dies and tools deteriorated only after the production of 250,000 units, its output in 1923 of 50,000 (point  $X_{1923}$ ) consumed but one-fifth of their physical usefulness. Consequently, it could bring out a newly styled model in 1924 only by scrapping equipment which was not yet worn out and could only be partially amortized. As a result, it would experience higher average costs in 1924 (*i.e.* curve  $AC_1$  in Figure 1) for any level of output below 250,000 units. Assuming that its 1924 output did not exceed that of the prior year, its costs exceeded price at point  $X_{1924}$ , and it was forced out of the market.<sup>77</sup>

After 1923, therefore, survival as a style-change manufacturer required construction of a plant capable of producing at least 250,000 automobiles per year from internally manufactured and annually altered components. Significantly, only two of the 81 firms independent of Ford and GM which were operating at the beginning of 1923 ever reached the 250,000 minimum optimal integrated level of output.<sup>78</sup> These two companies, Chrysler and Hudson (which later merged

77. The slope of  $AC_1$  was of critical importance for small volume producers and potential entrants after 1923. A steeper slope relative to AC indicated higher average costs due to style change expenses for every level of output below 250,000 units, the minimal scale for optimal efficiency in integrated production. Primarily, the slope of  $AC_1$  was the product of additional costs incurred in the premature scrapping of special tools and dies. These costs, of course, were directly related to the expense of procuring new equipment. Significantly, the costs of special tools, dies and jigs have risen dramatically since 1923. Although about the same number of cars were sold in 1923 and in 1940, for example, special tools cost ten times as much in 1940. Again, about twice as many cars were sold in 1957 as in 1923, but tooling costs had increased 100 times. Weiss, *supra* note 20, at 336. As noted, by 1970, the Big Three were spending \$1.5 billion each year for special tools and dies. Combined expenditures for special tools, dies, jigs and fixtures by the Big Three amounted to \$1,539 billion in 1969. STANDARD & POOR, *supra* note 18, at A170. Sen. Nelson estimated the cost of annual style changes at \$1.5 billion. N.Y. Times, Aug. 5, 1970, at 28, col. 3.

78. Chrysler has exceeded this sales volume for every year since 1928 with but one exception, in 1932; Hudson attained this output from 1924 through 1929, but then dropped below it during the 1930's. In 1954, Hudson merged with Nash to form the American Motors Corporation. AUTOMOTIVE NEWS, ALMANAC ISSUE 72 (1951).

It should be emphasized that after General Motors introduced annual restyling, abstention from this practice was apparently not perceived as a realistic alternative by smaller automobile producers. Menge, *supra* note 53, at 643. A possible explanation is that once all three leading companies began saturating the market after the 1920's with annually restyled cars, a small volume of standard-styled vehicles by comparison might have appeared obsolete.

## Automobile Industry

with Nash to form American Motors), would become the sole competitors of Ford and GM by the 1960's. Neither Kaiser-Frazer nor Crosley, the only firms to attempt entry after 1923, ever achieved this production scale.<sup>79</sup>

Annual style changes imposed a second burden upon smaller automobile producers: large-scale annual investments in advertising. Before 1923, automobile designs remained basically unchanged for several years.<sup>80</sup> With the introduction of annual style change, however, producers were compelled to undertake annual advertising campaigns to impress consumers with the unique appearance of annually altered automobiles.<sup>81</sup> The style change race had engendered an advertising competition in which only the financially resourceful could remain.<sup>82</sup> Moreover, smaller producers were seriously disadvantaged because of the scale economies associated with extensive promotional efforts. To accomplish the same or even sparser market coverage, small volume producers spent considerably more per unit of output than did large volume manufacturers. For example, GM was able to obtain 10 times more advertising space in 1930 than did Nash, a lower volume firm; at half of the latter's per car cost.<sup>83</sup> Returning to the analysis accompanying Figure I, therefore, it can be argued that the need to engage in large scale advertising annually, no less than the need to scrap expensive dies prematurely, increased average costs and consequently the slope of AC<sub>1</sub>, thereby driving scores of smaller producers from the market.<sup>84</sup>

The annual style change policy begun by GM also required a national system of adequately financed and strategically located dealers with

79. AUTOMOTIVE NEWS, ALMANAC ISSUE 60 (1970).

80. See note 56 *supra*.

81. See ADMINISTFRED PRICES, *supra* note 43, at 96.

82. Advertising expenditures increased dramatically as producers attempted to convince consumers of the obsolete character of older models which only a year earlier had been advertised as the ultimate in new design. *Id.* Consequently, industry promotional expenditures rose rapidly during the 1920's from approximately \$5 million in 1922 to nearly \$25 million by 1930. Nor was this increase due to an expansion in automobile sales. Output remained about the same for both years. AUTOMOTIVE NEWS, ALMANAC ISSUE 1931. By 1969, industry advertising expenditures amounted to approximately \$400-\$600 million. See note 163 *infra*.

83. In 1930, GM secured nearly \$20 million worth of advertising coverage at a per car cost of \$17. By comparison, Nash obtained less than \$2 million in coverage at a cost of \$34 per car. FTC REPORT, *supra* note 21, at 714-15; WEISS, *supra* note 20, at 359.

84. Smaller producers were unable to spread advertising and retooling expenses over the large volumes of output enjoyed by the Big Three. Consequently, their advertising and retooling costs per unit of output (i.e. average costs) were substantially higher than those of GM, Ford and Chrysler. Compelled to charge higher prices to cover higher average costs, these smaller firms found themselves priced out of the market. WEISS, *supra* note 20, at 340-47.

unique service facilities. Prior to the advent of periodic restyling there was little need for manufacturers to establish retail outlets with specialized maintenance capabilities.<sup>85</sup> Independent retailers provided adequate sales and service for a wide variety of automobiles.<sup>86</sup> By contrast, the need to differentiate the appearance of automobiles annually and the consequent decline in the interchangeability of components required the establishment of unique nationwide service organizations.

The need to establish nationwide service networks posed not only a great financial burden for smaller producers; it also involved significant economies of scale. The minimum volume sufficient to permit the maintenance of a nationwide system of dealerships with servicing facilities probably ranged from 100,000 to 150,000 units per year.<sup>87</sup> As a certain minimal sales volume was necessary to maintain a solvent dealer, producers with smaller annual outputs would have experienced severe difficulties in retaining an adequate number of dealers for national coverage. Significantly, few producers other than the Big Three ever reached this volume after 1923.<sup>88</sup> Consequently, their average distribution costs were substantially higher than those of GM, Ford and Chrysler. Moreover, as the Big Three expanded their dealer networks, smaller producers found it increasingly difficult to establish and maintain retail outlets without experiencing increased per unit costs.<sup>89</sup>

The need to integrate forward into retail distribution, therefore, was another factor attributable to style change that substantially raised the amount of capital necessary for successful entry and survival in the automobile manufacturing industry. Each of the three factors necessary for annual style change involved tremendous capital investments of hundreds of millions of dollars.<sup>90</sup>

85. See p. 578 *supra*.

86. See note 57 *supra*.

87. Although this estimate was derived during the early 1950's it is most likely also applicable to periods before and after. BARRIERS, *supra* note 3, at 301-06. WEISS, *supra* note 20, at 343.

88. Of the 21 producers other than the Big Three operating during the years 1931-41, for example, only Studebaker reached this output for two years (1940-41). AUTOMOTIVE AND AVIATION INDUSTRIES, March 15, 1946, at 88.

89. As one economist has observed: "[b]y saturating an area with dealers handling their own respective products exclusively," the Big Three "can effectively deny their smaller existing and potential competitors access to the best sites and most efficient retailers, thus raising the per-unit sales and distribution costs of these actual and potential competitors. . . ." Mueller, *Sources of Monopoly Power: A Phenomenon Called "Product Differentiation,"* 2 ANTIT. LAW & ECON. REV. 59, 80 (Summer 1969).

90. "The most important factor that caused the defunct companies to fail was the lack of capital to meet the increasing emphasis and staggering cost of frequent product changes and other product differentiation policies and practices of the Big Three." Lanzillotti, *supra* note 24, at 348.

## Automobile Industry

This brief analysis indicates that the automobile industry became increasingly concentrated following the introduction of annual style change in 1923. There are, however, other hypotheses which might explain this phenomenon. For example, declining economic conditions and a rise in automobile mergers might have contributed to increased industry concentration.<sup>91</sup> But these developments could not have been the primary cause of the dramatic change in this industry's structure. For example, the rate of attrition for automobile firms during the depressed 1930's was only slightly greater than in the booming 1920's.<sup>92</sup> Moreover, the predominant number of firms which left the market did so because of failure rather than combination.<sup>93</sup>

Instead, this economic analysis suggests that four factors (components integration, formidable advertising, franchised distribution, enormous capital requirements) were the direct cause of concentration and that each of these developments was linked in turn to the introduction of annual style change. Other hypotheses, however, could aid in explaining the emergence of these four factors. Substantial fluctuations in economic conditions following World War I, for example, may have contributed in part to the industry's movement toward captive production and distribution facilities.<sup>94</sup> On the other hand, these four developments cannot be accounted for, as some have urged, by a "drive for efficiency" in performance improvement.<sup>95</sup> The foregoing analysis demonstrates that without the need to restyle annually, optimal efficiency in the production of automobiles with increasingly improved performance capabilities had been reached by many firms in the industry. Once annual style change became the industry code of behavior, however, efficiency in the production of annually restyled vehicles made these four developments almost inevitable.

On balance, therefore, this brief analysis indicates that although other hypotheses might assist in the explanation of how this industry became highly concentrated in a short period of time, annual style change might well have been its fundamental cause.

91. See, e.g., *ADMINISTERED PRICES*, *supra* note 43, at 8-9; *ERSTEIN*, *supra* note 47, at 187.

92. *Lanzillotti*, *supra* note 24, at 321.

93. *Id.*

94. See *SELTZER*, *supra* note 32, at 114-20, 191-97.

95. See, e.g., *GENERAL MOTORS*, *supra* note 52, at 71-75 (1968). GM argues that these developments resulted from a drive for efficiency in the production of automobiles. Yet it admits that the concept of efficiency is not fixed and depends, *inter alia*, upon "product characteristics." *Id.*, at 73 n.36. In short, these developments were engendered not by any vague pursuit of "efficiency" but rather by a fundamental change in product policy, *i.e.*, the introduction of annual restyling.

**B. Style Change as a Market Weapon for Preserving Concentrated Economic Power: Barriers to Entry**

Style change has proved to be as effective a market weapon in preserving concentrated economic power in the automobile industry, it can be argued, as it had been in achieving it.<sup>96</sup> By causing formidable entry barriers to be raised, style change insured that the vacancies created by the exit of nearly one hundred firms were not filled by newcomers.

The same four factors which by eliminating earlier producers led to concentration seem also to have erected insurmountable barriers to potential entrants. The magnitude of these barriers can be measured in at least three separate ways. First, the experience of the only firm seriously to attempt entry since 1923, Kaiser-Frazer, can be evaluated. Second, industrial studies of the automobile manufacturing process can reveal the minimum scale of operations, minimum promotional expenditures, and minimum capital resources necessary for entry today. Finally the estimates of firms which have recently contemplated (but decided against) entry may be examined.

Since 1923, a handful of attempts at entry, all unsuccessful, have been undertaken.<sup>97</sup> Of these, only the Kaiser-Frazer endeavor of 1945-1954 could be considered a serious challenge.<sup>98</sup> Kaiser had already successfully broken into two of the most highly concentrated industries in the American economy (aluminum and steel). Given a most propitious time of practically insatiable postwar demand, its venture into automobiles seemed assured of success. It commanded the talents of experienced executives, the backing of a multi-million dollar industrial empire, and the acquired production and distribution facilities of an operative automobile organization (Graham-Paige Motors). Through stock offerings, loans from private and government agencies, and financial resources derived from other Kaiser enterprises, it raised more than \$200 million. Within a record time of 11 months, it produced a car which was praised for both its engineering achievement and for its style.<sup>99</sup> Its market share rose to nearly 5 per cent of industry

96. See Vatter's account of closure of entry into this industry, *supra* note 22.

97. Unsuccessful attempts were made, for example, by Durant Motor Co. of Indiana (1924), Rollin Motors Co. (1924), Klieber Motor Co. (1926), Falcon Motors Corp. (1927), Crosley Motors, Inc. (1939), and Kaiser-Frazer Corp. (1945). EPSTEIN, *supra* note 47, at 377-82; ADMINISTERED PRICES, *supra* note 43, at 82.

98. WEISS, *supra* note 20, at 338-39. For a general account of the Kaiser venture into automobiles, see also Lanzillotti, *supra* note 24, at 328-29; Vatter, *supra* note 22, at 230-33; Kaiser-Frazer: "The Roughest Thing We Ever Tackled," 44 FORTUNE 74 (July 1951).

99. FORTUNE, *supra* note 98, at 156, 158.

## Automobile Industry

sales by 1948.<sup>100</sup> Yet, by 1949, the Kaiser venture was doomed to failure. Its share of sales fell back to a little more than 1 percent, and by 1954, it had ceased production.<sup>101</sup>

The reason for this sudden reversal in Kaiser's market position after 1948 has been succinctly stated by economists: its survival required the launching of a new model, yet it was unable to finance a restyled automobile for 1949.<sup>102</sup> Although sales in 1948 had reached 181,000 units, that volume was insufficient to finance formidable retooling and advertising costs.<sup>103</sup> As Kaiser Industries reported later:

To stay in the market, Kaiser-Frazer now had to play the "new models" game for the first time; new models took tools; tools took major financing. An attempt was made to sell a third stock issue to the public in 1948, but that ran aground . . . .<sup>104</sup>

Consequently, it was forced to sell its 1948 models again in 1949 and 1950. In 1951, it managed to produce a newly styled model; but by then its output was far below the minimum volume necessary for optimum efficiency.<sup>105</sup> As a result, higher per unit production costs forced its prices above those of the Big Three.<sup>106</sup> Thereafter, its sales plummeted, and it accumulated uninterrupted losses until it withdrew from the market in 1954, with an earned surplus deficit amounting to more than \$100 million.<sup>107</sup>

Evaluation of the short-lived Kaiser entry suggests that it suffered in varying degrees all the disadvantages which had contributed to the elimination of the earlier producers.<sup>108</sup> Formidable scale economies in production and retail distribution, massive promotional activities, and enormous capital requirements were the principal factors accounting for its demise.<sup>109</sup> As evidenced by its inability to finance a 1949 model, its 1948 record volume of 181,000 units was below the minimum optimal scale for integrated production, which had been estimated at about 250,000 for the early 1940's.<sup>110</sup> During succeeding years, how-

104. KAISER INDUSTRIES CORP., THE KAISER STORY 45 (1968).

105. After failure of the public issue in 1948, Kaiser went to the banks which had helped fund its breakthrough into aluminum and steel, but they considered the risks prohibitive and refused further participation. Lanzillotti, *supra* note 24, at 329.

106. FORTUNE, *supra* note 98, at 161. In 1950, it lost \$13 million on its sale of 151,000 automobiles. *Id.*

107. MOODY'S INDUSTRIAL MANUAL 1616 (1955).

108. INDUSTRIAL ORGANIZATION, *supra* note 2, at 285-87.

109. *Id.* See also Lanzillotti, *supra* note 24, at 328-29.

110. See note 73 *supra*.

ever, it suffered further scale economy disadvantages as its volume dropped below the minimum 100,000-150,000 unit volume required for optimal efficiency in retail distribution.<sup>111</sup> To meet the retooling and readvertising requirements of annual style change, moreover, Kaiser would have needed an additional \$150 million, which would suggest a total capital resources entry barrier exceeding \$350 million.<sup>112</sup> In fact, this \$350 million estimate is probably too low for a potential entrant today since Kaiser enjoyed several advantages which are no longer accessible to a newcomer in the 1970's.<sup>113</sup> Reviewing the failure of Kaiser's automobile venture despite its sizeable resources and its record as one of the country's most formidable challengers of concentrated industries, one industrial economist concluded in 1966: "The idea of any further entry into the industry today seems preposterous."<sup>114</sup>

Subsequent studies of the Kaiser-Frazer attempt and the recent operations of the Big Three now afford a more precise determination of the actual magnitude of barriers to entry into this industry, barriers which may be largely attributable to annual style change. In 1970, it would cost a company \$779 million to enter the automobile industry. The costs of annual style change capability, it is estimated, account for fully \$724 million, or more than 90 per cent of this figure.<sup>115</sup> More-

111. AUTOMOTIVE NEWS, ALMANAC ISSUE 60 (1970).

112. As sales fell, Kaiser's dealers were unable to meet their overhead costs and declined from a high of 4700 in 1948 to 2700 in 1951, scarcely 200 more than the number considered minimally necessary for national coverage. WEISS, *supra* note 20, at 343; FORTUNE, *supra* note 98, at 158. With regard to capital required for annual restyling and advertising, Kaiser later concluded conservatively that it needed at least \$150 million more in equity resources. FORTUNE, *supra* note 98, at 161. When added to the more than \$200 million Kaiser actually raised, this would indicate a capital requirement of more than \$350. See p. 586 *supra*.

113. For example, through its acquisition of Graham-Paige Motors, it was able to obtain an operational manufacturing and dealer organization. By contrast, today's entering firm would have to construct both *de novo*. The production facilities of the earlier independents have either been sold to the four domestic producers or scrapped; their retail networks have long since disappeared. ADMINISTERED PRICES, *supra* note 43, at 14. Absent the opportunity to acquire existing facilities, however, newcomers would require from an estimated \$779 million to \$2 billion to build both systems at the minimum optimal volume necessary for annual style changes (*i.e.*, 300,000 units). See notes 113, 123 *infra*.

114. WEISS, *supra* note 20, at 339.

115. Yearly restyling requires efficient assembly and integrated components production facilities at a minimum plant investment of \$250 million. Bain estimates that efficient production and assembly of body and engine components would require a minimum plant capacity of 300,000 units, at a cost of \$250 million. INDUSTRIAL ORGANIZATION, *supra* note 2, at 286. Annual restyling also necessitates integration forward into a nationwide distribution network costing no less than \$326 million. This was Romney's estimate of the capital required by a 250,000 unit firm in 1958 to establish a national distribution system. ADMINISTERED PRICES, *supra* note 43, at 16 n.28. Finally, annual style change would compel retooling and readvertising at a minimum annual rate of \$180 million and \$23 million, respectively. This annual retooling figure assumes output at the minimum efficient level of 300,000 units. It was obtained by multiplying the per unit full factor costs for style change (*i.e.* including the actual added production costs of producing the redesigned vehicle) as calculated at \$600 by Fisher, Griliches & Kaysen, *The Costs of Automobile Model Change During a Decade*,

## Automobile Industry

over, to merely recapture its \$779 million investment, an entering firm would need to secure from 4 to 8 per cent of total industry sales for an efficient scale of operations.<sup>116</sup> In addition, it would encounter for 5 to 10 years a net price disadvantage of at least 5 per cent of factory price due to higher per unit countervailing advertising expenses and price concessions necessary to maintain a solvent national dealership system.<sup>117</sup>

By contrast, had the industry not been restructured by annual style change, it is estimated that entry in 1970 could have been achieved for \$35 million, or less than one-tenth as much as the actual capital requirement.<sup>118</sup> Absent annual style change, an entrant could operate efficiently with an estimated 0.7 to 2.1 per cent of the market<sup>119</sup> without encountering promotional or distributional price disadvantages.<sup>120</sup> To the extent, therefore, that style change transformed the condition of entry into this industry, barring all but completely integrated firms able and willing to spend not merely \$35 million but \$779 million, it

70 J. Pol. Econ. 433, 450 (1962), by the output  $(300,000 \times \$600 = \$180 \text{ million})$ . The re-advertising amount was obtained by multiplying the current \$75 per car advertising expenditure of the Big Three (see Lanzillotti, *supra* note 24, at 343) by the minimum efficient output level of 300,000 units = \$22.5 million. Realistically, a new firm would probably expend at least twice that amount overcoming consumer loyalty to current automobile models engendered by decades of advertising by established sellers. In 1958, Romney then president of American Motors estimated that a plant with a 250,000 unit output would require \$35 million for annual advertising. ADMINISTERED PRICES, *supra* note 43, at 17, table I. The costs of annual style change capability are \$779 million less \$35 million, or \$724 million. See note 118 *infra*.

116. See note 22 *supra*.

117. *Id.*

118. Absent the need for an entering firm to restyle annually and assuming the existence of independent parts manufacturers and independent distributors, the formidable costs of components production and of distribution would have been borne not by the entrant but by these specialized independent enterprises. Thus, an assembler of automobiles could have accomplished entry under these hypothetical conditions by merely constructing an assembly plant at a cost of \$50 million and by spending an additional \$5 million for introductory promotion. On the basis of the Kaiser experience and from studies of the Big Three's manufacturing operations, Bain has estimated that an assembler could operate with optimal efficiency at a minimum output of 60,000 vehicles per year. BARRIERS, *supra* note 3, at 245. See also ADMINISTERED PRICES, *supra* note 43, at 14. The cost of an assembly plant one-fifth as large as that minimally required for annual restyling (*i.e.*, 300,000 units) has been assumed to be one-fifth of the cost of the latter facility, or \$50 million. See note 115 *supra*. Assuming that a new entrant would engage in countervailing advertising at a rate equal to that of the Big Three, the cost of such advertising for the first year may be computed by multiplying the average Big Three per car advertising expenditure of \$75 (see note 115 *supra*) by the minimum efficient level of output for an assembler of 60,000 units:  $\$75 \times 60,000 = \$4.5 \text{ million}$ . Assuming further, however, that the assembler's product would remain basically unchanged pending major technological breakthroughs, subsequent advertising expenditures should decline as the public becomes acquainted with the characteristics of the assembler's unchanged model. See note 56 *supra*. But these conditions no longer obtain: entry as an assembler has not been feasible since the 1920's.

119. These percentages were derived by calculating the share of total industry sales in 1969 (8.38 million per note 18 *supra*) represented by the minimum efficient scale for assembly operation, estimated at from 60,000 to a high of possibly 180,000 units per year. BARRIERS, *supra* note 3, at 245.

120. See note 22 *supra*.

raised the capital costs of entry considerably more than tenfold.<sup>121</sup> To the extent that it required entrants to capture a formidable segment of industry sales and to endure substantial price disadvantages and hence losses for up to a decade, it made the risks of entry prohibitive.

A large number of companies have recently developed alternative automobile propulsion systems utilizing gasoline, electricity, steam and freon; but, significantly, not a single firm has attempted entry. Representatives of these companies have generally agreed in their testimonies before Congress that absent major antitrust action or some form of government subsidization, entry by firms offering innovative alternatives is economically infeasible.<sup>122</sup> Estimates made by these prospective entrants suggest that style change barriers today are higher than the foregoing analysis would suggest.<sup>123</sup>

121. This is a conservative estimate of the entry barriers attributable to annual style change. For example, Bain argues that an entering firm would probably encounter break-in losses of \$15 million annually for a ten year period, or \$150 million. INDUSTRIAL ORGANIZATION, *supra* note 2, at 286. Romney's estimate of the first year capital requirements necessary for a 250,000 unit integrated operation in 1958 amounted to \$502.2 million. This figure included \$326.2 million to establish a national dealer system. ADMINISTERED PRICES, *supra* note 43, at 16 n.28. See also Sen. Morse's statement as to a subsequent increase in Romney's estimate to roughly \$2 billion. *Hearings Before the Senate Select Comm. on Small Business on the Status and Future of Small Business in the American Economy*, 90th Cong., 1st Sess., pt. 2, at 431 (1967).

122. See, e.g., *Joint Hearings on the Automobile Steam Engine and Other External Combustion Engines* [hereinafter cited as *J. Hearings—Steam*], 90th Cong., 2nd Sess. (1968); *Electric Vehicles and Other Alternatives to the Internal Combustion Engine*, *Joint Hearings Before the Senate Comm. on Commerce and the Subcomm. on Air and Water Pollution of the Senate Comm. on Pub. Works*, 90th Cong., 1st Sess. (1967) [hereinafter cited as *J. Hearings—Electric*]. For suggestions regarding "major antitrust action" to restructure the industry, see testimony of Arkus-Duntov in 1969 *Hearings*, *supra* note 24, at 404-06. Regarding the alternative need for government subsidization of entry, see testimony of Ayres in *J. Hearings—Steam*, *supra* at 10-12.

123. Prospective automobile firms place the minimum optimal scale for integrated production at 500,000 instead of 300,000 units. Arkus-Duntov, 1969 *Hearings*, *supra* note 24, at 406. They also state that an annual sales volume of 500,000 or more vehicles is minimally required to maintain a national dealer system. Wyman, *Can the Steam Automobile Come Back*, 9 STEAM AUTOMOBILE #2 (1967). The initial capital investment required merely to build an integrated plant with this annual capacity has been estimated at \$1 to \$2 billion. Arkus-Duntov, 1969 *Hearings*, *supra* note 24, at 406.

Moreover, there are indications that the Big Three are pursuing programs which will raise entry barriers even further. While their trend toward more complete backward integration has continued unabated, see, e.g., STANDARD & POOR, *INDUSTRY SURVEYS: Auto Parts—Basic Analysis* A138 (October 8, 1970), these firms have begun to place major emphasis on greater forward integration into retail distribution and are buying up formerly franchised outlets. Until recently, the Big Three distributed their automobiles through a large number of franchised dealers who although pressured to accept a policy of exclusivity might have been at least theoretically accessible to new automobile producers. See Ralph Nader's testimony in 1968 *Hearings*, *supra* note 20, at 155. Now, however, they are rapidly eliminating dealerships and replacing franchised outlets with factory-controlled operators or "house dealers." See Note, *Antitrust Law and The New Industrial State: An Application to Automobile Distribution Practices*, 4 UNIV. OF SAN FRANCISCO L. REV. 78, 111 (1969). As a result, the number of active dealerships has declined from 49,173 in 1949 to 27,486 in 1969, or by more than 44 per cent. See testimony of Hammond in 1969 *Hearings*, *supra* note 24, at 19. In addition, franchised dealers who have not yet been replaced by factory operators, increasingly are being bypassed by direct "fleet sales" made by the manufacturers to retail customers at below dealer or even production cost. *Hearings Before the*

## Automobile Industry

General Motors, Ford and Chrysler reject any notion of "artificial" barriers to entry into the automobile industry. Instead, they contend that there are no obstacles which cannot be overcome.<sup>124</sup> In support of their position, they cite the possibility of conglomerate entry by General Electric and Westinghouse and the actual expansion of several foreign manufacturers into the market.<sup>125</sup> But conglomerate entry by either of these firms has failed to materialize despite the technological capability of both to produce reliable electric vehicles and the vast financial resources of the former.<sup>126</sup> The Big Three's second line of defense involves the successful expansion of standard styled foreign imports, particularly Volkswagen and Toyota, into the American market.<sup>127</sup> This comparison of foreign with domestic entry possibilities, however, is entirely inappropriate.<sup>128</sup> Moreover, it suggests that by

*Special Subcomm. on Automobile Marketing Practices of the Senate Comm. on Commerce*, 90th Cong., 2d Sess. 5-8 (1968). These developments, however, will not only absolutely foreclose retail outlets from new entrants, it will also deprive those few remaining independent parts manufacturers of the outlets they require for survival. Furthermore, the elimination of components producers will augment existing barriers to entry by new automobile manufacturers.

124. General Motors suggests, for example, that "entry into the business is open to all who are willing to assume the risks: there are no artificial barriers." *GENERAL MOTORS*, *supra* note 52, at 81. It concedes, however, that there are "certain critical requirements for entry" including large capital investment and substantial economies of scale. *Id.*, at 83. But it implies that these entry requirements are compelled in part by the "competitive necessity" of engaging in annual style change. *Id.*, at 83-84, 29. Thus, it argues that annual restyling is a form of efficiency mandated by consumer preference and that any barriers resulting therefrom are inherently "natural" rather than "artificial." *Id.*, at 29, 52-53, 71-75, 84-85. This argument assumes implicitly, however, that consumer acquiescence in the Big Three's policy of planned obsolescence is equivalent to consumer preference for that policy. Upon closer examination, such an assumption appears to be wholly unwarranted. See note 141 *infra*. Moreover, there is evidence that by substantially inflating production and distribution costs and by discouraging technological innovation, annual style change has actually led to a net reduction in efficiency. See note 136 *infra*.

125. General Motors, for example, relies on the rumored possibilities of electric car entry by General Electric or Westinghouse to support its argument that entry into the industry remains possible. *GENERAL MOTORS*, *supra* note 52, at 83-84. For a similar suggestion regarding the possibility of conglomerate entry into the industry, see Shubik, *A Game Theorist Looks at the Antitrust Laws and the Automobile Industry*, 8 *STAN. L. REV.* 594, 624-25 (1956).

126. See *J. Hearings—Steam*, *supra* note 138, at 205-06; *J. Hearings—Electric*, *supra* note 138, at 486-87. Moreover, as the nation's fourth largest industrial corporation, General Electric in particular should have no financial entry difficulties—if access is as open as General Motors suggests. For GE's sales rank, see *FORTUNE*, May 1970, at 184.

127. *GENERAL MOTORS*, *supra* note 52, at 81, 82 n.46.

128. Unlike a prospective domestic entrant, foreign producers such as Volkswagen and Toyota relied upon large plant scale economies in Germany and Japan, respectively, and enormous world-wide sales to support their expansion into the American market. These companies marketed vehicles in America for nearly a decade before their sales volumes here reached the 60,000 unit level considered minimally adequate for efficient production of standard-styled cars. See Schupack, *1968 Hearings*, *supra* note 20, at 920. Indeed, even GM admits this distinction. *GENERAL MOTORS*, *supra* note 52, at 23. Volkswagen began producing automobiles in 1915 but did not begin selling in the United States until 1949. In that year, it sold two vehicles. Not until 1958 did its sales volume in this country exceed 60,000 units. *FORTUNE*, August 1957, at 106; *FORTUNE*, March 1969, at 116. Similarly, Toyota first began selling vehicles in this country in 1958, but only in 1968 did its sales

simply not annually changing model styles a domestic firm could overcome all the structural obstacles occasioned by nearly five decades of annual restyling by the Big Three. This is demonstrably untrue.<sup>129</sup>

The foregoing analysis suggests that by pursuing annual style change the Big Three may have created an anticompetitive industry structure of three well-entrenched manufacturers. High market concentration may enable them to restrict output and raise prices above competitive levels. High barriers to entry may deter newcomers attracted by the tight oligopoly's greater-than-competitive profits. Again, pending a more exhaustive investigation by the FTC, annual style change appears to have been the underlying cause of these developments.

### C. Style Change and Performance

For most antitrust economists, noncompetitive performance (e.g., high prices, high costs, retarded innovation) is an inevitable result of anticompetitive structure.<sup>130</sup> It has been suggested, however, that due to their relative inexperience in the economics of industrial organization, the courts might be less willing to make this causal leap and might demand instead a showing of both anticompetitive structure and noncompetitive performance.<sup>131</sup> Some manifestations of unsatisfactory performance resulting from the automobile industry's anticompetitive structure have already been described.<sup>132</sup> To the extent, therefore, that annual style change was responsible for this structure, it indirectly impaired the industry's performance. This section briefly suggests, however, that annual style change itself may directly con-

here reach the 60,000 volume level. *FORTUNE*, December 1969, at 77. By the time that sales volume was achieved in America, Volkswagen was selling nearly half a million, and Toyota a million and a quarter, automobiles in more than 100 countries. *FORTUNE*, August 1957, at 106; *FORTUNE*, December 1969, at 78.

129. Entry as an assembler is no longer feasible. The independent parts manufacturers and independent retail distributors of earlier years have largely vanished as the Big Three have moved toward complete vertical integration. See note 113 *supra*. Consequently, an entrant bent on producing a standard-styled vehicle in 1970 would need nonetheless to integrate backward into components production and forward into a nationwide distribution system, at a capital investment cost estimated at more than half a billion dollars. Backward integration would require a minimum of \$250 million; forward integration could be achieved at a cost of no less than \$326 million. Note 115 *supra*. Even were it able to raise this amount of capital, a firm offering standard-styled cars to consumers accustomed to annually restyled products would probably be compelled to undertake lengthy and expensive countervailing promotional campaigns and to sell its vehicles at a substantial price disadvantage for a decade or more. See p. 589 *supra*. Indeed, it took Volkswagen and Toyota that long; and unlike a domestic entrant, these firms were able to rely on substantial worldwide sales to subsidize their prolonged break-in losses in this country. Schupack, 1968 *Hearings*, *supra* note 20, at 920 n.6.

130. See, e.g., Mueller, *supra* note 2, at 89-90; notes 2 & 3 *supra*.

132. See note 24 and accompanying text *supra*.

## Automobile Industry

tribute to unsatisfactory market performance by reducing efficiency and retarding progressiveness.

Efficiency in terms of market performance is generally measured by comparing actual costs and prices with those that would obtain in a competitively structured market.<sup>133</sup> Annual style change has substantially inflated production and distribution costs, and hence prices, by vastly increasing selling and retooling costs. In 1969, as noted above, the Big Three spent \$1.56 billion, or \$195 per car, for restyling.<sup>134</sup> Advertising accounted for another \$75 in per unit expenditures.<sup>135</sup> These costs amounted to several billion dollars in consumer expenditures for 1969. Yet buyers were never given a choice between purchasing the same model as last year's at a lower price and a new model at a higher price.<sup>136</sup>

Moreover, there is some evidence that the Big Three may employ annual style change as a surrogate for cost-saving innovations. By introducing a "new" model each year, they provide consumers with the illusion of progress and yet avoid the necessity of adopting technological improvements which would lower maintenance or initial purchase costs.<sup>137</sup> It has been argued, for example, that application of known

133. See note 5 *supra*.

134. See p. 576 *supra*.

135. See note 115 *supra*.

136. Turner has framed the cost savings loss argument in the following manner:

The major producers evolved a policy of annual model changes that, by accelerating the scrapping of expensive machine tools and dies, substantially increased the cost of automobiles. Since all of the major producers pursued this policy, and since the products of small producers were for a variety of reasons unappealing to most consumers, buyers were never given a choice between purchasing the same model as last year's at a lower price and a new model at a higher price.

*Conglomerate Mergers and Section 7 of the Clayton Act*, 78 HARV. L. REV. 1313, 1335 (1965). See also WISS, *supra* note 20, at 364-65. The study by Fisher *et al.* estimated that the cost savings loss to consumers resulting from annual style and performance changes amounted to approximately \$5 billion annually, *supra* note 115, at 433-51. BLS data indicate that nearly all of the \$5 billion model change cost to the consumer is attributable to restyling rather than performance modification. See pp. 576-77 *supra*. To this figure must be added the cost savings loss due to the diversion of resources from technological improvements to style alterations. For example, had the Big Three spent \$36 of the estimated \$195 consumed in restyling (see p. 576 *supra*) for processing its sheet metal with a chrome over galvanized steel process, the resulting doubling in the automobiles longevity would have saved consumers \$2.1 billion a year. See p. 594 *infra*.

137. See testimony of Arkus-Duntov in 1969 Hearings, *supra* note 24, at 402-03.

For example, if the chrome over galvanized steel treatment discussed at p. 594 *infra*, were utilized, automobiles would physically deteriorate less than twice as rapidly. Presumably, industry sales would therefore fall as the demand for replacements declined. The failure of this industry to adopt measures such as these which would improve the durability of its products, coupled with its promotion of psychological deterioration through annual style changes, has led many economists to charge the Big Three with "planned obsolescence." See, e.g., Lanzillotti, *supra* note 24, at 341-45; Dowd in 1969 Hearings, *supra* note 24, at 524. Moreover, it has been suggested that the Big Three are reluctant to introduce steam or electric vehicles because the number of parts required for these propulsion systems is far less than those needed for conventional gasoline engines. Since these firms derive a substantial amount of profit from "aftermarket" (i.e., replacement parts) sales, they

metallurgical processes would permit doubling the life of an automobile for an additional cost of \$36 per year, resulting in an annual savings to consumers of more than \$2 billion.<sup>138</sup> Crash-absorption bumpers have been developed which could save the public an additional \$1 billion a year.<sup>139</sup> Pollution-free electric and steam vehicles can now be produced which would cost half as much to own and even less to operate than conventional gasoline automobiles.<sup>140</sup> These developments, however, would increase automobile durability and thereby reduce demand, price and profits on new car sales. It is suspected, therefore, that the Big Three have repressed these cost-savings advances while offering consumers instead an annual restyling policy designed to bolster replacement demand through planned obsolescence.<sup>141</sup>

Similarly, annual style change may have retarded this industry's

are unwilling to produce pollution-free vehicles which have a significantly smaller after-market. Esposito, *supra* note 24, at 35. There is perhaps another reason for this reluctance. It has been suggested that were the Big Three to produce electric vehicles, for example, industry barriers to entry would decline due to lower production costs and minimum scale economies. Ayres, *J. Hearings—Steam*, *supra* note 122, at 8.

138. Testimony of Lutz in 1969 *Hearings*, *supra* note 24, at 468-70.

139. N.Y. Times, October 2, 1970, at 19. Sen. Nelson also cites the automobile industry for its failure to use energy absorbing bumpers and crash bars in its products. 1969 *Hearings*, *supra* note 24, at 512. The U.S. Steel Corporation has developed an automobile body with complete perimeter crash protection including steel roll bars front and rear. N.Y. Times, October 12, 1970, at 37.

140. See, e.g., statement of Orr in *J. Hearings—Steam*, *supra* note 122, at 63; Federal Power Commission, *Development of Electrically Powered Vehicles* in *J. Hearings—Electric*, *supra* note 122, at 29.

141. See note 137 *supra*. It might be suggested, nevertheless, that unless consumers were completely content with annual restyling they would not continue to purchase vehicles from the Big Three. See note 121 *supra*. This argument, however, is specious. It is tantamount to suggesting that whenever consumers willingly buy products from a monopolist or tight oligopolist, they are content with the price and quality of the goods purchased. In fact, the public pays higher-than-competitive prices for less-than-optimum-quality goods when there is an absence of alternative suppliers, i.e., an absence of competition. Such is the condition of the automobile industry. Unless a consumer can utilize the less than standard-sized vehicles of the foreign automobile producers, he has little choice but to purchase an annually restyled car from the Big Three. Moreover, the substantial rate of depreciation engendered by annual restyling will encourage him to repurchase on an annual or semi-annual basis. The fact that consumers continue to purchase annually restyled vehicles, therefore, does not necessarily imply that they would not prefer a wider range of alternatives provided by a less concentrated automobile industry. See Dowd in 1969 *Hearings*, *supra* note 24, at 540; Schupack in 1969 *Hearings*, *supra* note 24, at 541.

Within the past few months, the Big Three have introduced "subcompact" vehicles to compete with the imported standard-styled automobiles of foreign manufacturers, particularly Volkswagen and Toyota. Whether these subcompacts will be annually restyled is still an open question. Ford has suggested that its subcompact entry, the *Pinto*, might remain as basically unchanged as its earlier *Model T*. New York Times, November 6, 1970, at 42. Nevertheless, the Big Three's earlier introductions of "compacts" in the early 1960's were accompanied by similar overtones of standard-styling. Yet, the compacts were in fact restyled annually. Moreover, even if the subcompacts do remain unchanged, they will not encourage *de novo* entry into the automobile field by other firms. To meet the short-term threat of attempted entry into the subcompact market, the Big Three could rely on profits from their sales of restyled, regular-sized vehicles to subsidize increased promotion and near-cost sales of their subcompacts. To survive, a new domestic entrant would require a share of the regular-sized car market, but that larger field is still very much influenced by the Big Three's annual restyling policies.

## Automobile Industry

progressiveness as measured by the number and importance of actual innovations that have been developed as compared with what could have been achieved absent style change. It has been noted, for example, that the innovative characteristics of the industry began to decline shortly after annual restyling was introduced in the 1920's.<sup>142</sup> Moreover, there is evidence that since then an increasing proportion of the Big Three's resources have been shifted from research and development to restyling and related promotional activities.<sup>143</sup> Perhaps as a result, most recent innovations have come from outside the leading firms. Improvements such as new suspension systems and disc brakes were first introduced by small European firms.<sup>144</sup> Other advances, notably automatic transmissions and power steering, originated in small domestic concerns.<sup>145</sup> In short, an emphasis on style change may have supplanted the drive for technological progress in this industry.

Furthermore, it has been suggested that, paradoxically, annual style change does not result in a wide variation in the appearance of different automobile makes.<sup>146</sup> Instead, given their high degree of interdependence, the Big Three protectively imitate each other's designs.<sup>147</sup> Thus, Professor Bain has found that in this industry "the highly imitative product policies of rival oligopolists seem to lead to substantial uniformity of available products and to a suppression of the potential variety in products."<sup>148</sup> Annual style change, then, may only have increased the rate rather than the degree of style innovation.<sup>149</sup>

As a fundamental determinant of this industry's highly anticompetitive structure, annual style change may have been the primary factor accounting for what could be termed noncompetitive performance in automobile manufacturing. In addition to increasing concentration and raising barriers to entry, it appears to have substantially impaired industry market performance by reducing efficiency and retarding technological growth.

142. See Lanzillotti, *supra* note 24, at 345.

143. Testimony of Arkus-Duntov, 1969 *Hearings*, *supra* note 24, at 402-03. GM, for example, reported that in 1967 it spent \$664 million for R&D, as compared with \$881 million for annual restyling. 1968 *Hearings*, *supra* note 20, at 736, 746.

144. Lanzillotti, *supra* note 24, at 344. Disc brakes were mass produced by smaller European automobile manufacturers for more than a decade before they appeared on American cars. Nader in 1968 *Hearings*, *supra* note 20, at 212.

145. Lanzillotti, *supra* note 24, at 344.

146. See, e.g., INDUSTRIAL ORGANIZATION, *supra* note 2, at 240-42, 423-25; Mueller, *supra* note 89, at 90-91. But see Jacoby's testimony in 1969 *Hearings*, *supra* note 24, at 541.

147. See note 24 *supra*.

148. INDUSTRIAL ORGANIZATION, *supra* note 2, at 425.

149. For example, the migration of the gear shift from floor to steering column and, recently, back to floor again affected the rate but not the net amount of change. Note 39 *supra*.

### III. Automobile Style Change as an "Unfair Method of Competition" Under Section 5 of the Federal Trade Commission Act

As previously noted, annual style change is a form of oligopoly conduct apparently invulnerable to prosecution under conventional Sherman and Clayton Act standards. This, however, was the type of problem Congress sought to solve by enactment of Section 5 of the Federal Trade Commission Act in 1914. More than two decades had passed since its passage of the Sherman Act in 1890; but Congress believed that its earlier legislation had been largely ineffective in halting a widespread and growing concentration in industry.<sup>150</sup> To avert further concentration, it created the Federal Trade Commission as an administrative tribunal capable of undertaking intensive economic investigations and empowered under Section 5 to strike down "unfair practices" which, although lawful in themselves, nevertheless tended toward a suppression of competition through the elimination of actual or potential rivals.<sup>151</sup> Congress deliberately left unspecified those practices which the FTC might proscribe as "unfair" in order to allow the Commission the widest latitude in dealing with novel methods by which concentration might be increased.<sup>152</sup>

In reviewing FTC findings of "unfair methods of competition" in cases brought under Section 5, the Supreme Court has complied with the intent of Congress by establishing flexible guidelines for illegality. It has deferred to the FTC's administrative expertise, holding that "[t]he precise impact of a particular practice on the trade is for the Commission, not the courts, to determine"<sup>153</sup> and limiting its function

150. See *Federal Trade Commission v. Gratz*, 253 U.S. 421, 432 (1920) (Brandeis, J., dissenting).

151. *Id.* at 442-43.

152. *Id.* at 423; S. REP. NO. 597, 63d Cong., 2d Sess. 13 (1914). The Conference Report stated: "It is impossible to frame definitions which embrace all unfair practices. There is no limit to human inventiveness in this field." *Id.* By enacting Section 5, Congress hoped to establish an expert body which by "careful study of the business and economic conditions of the industry affected" could detect and condemn concentration-increasing conduct which was impossible to reach under the Sherman Act or the recently enacted Clayton Act. *Federal Trade Commission v. Keppel & Bros.*, 291 U.S. 301, 314 (1934); S. REP. NO. 397, *supra*, at 9, 11.

The legislative history clearly evinces the intent of Congress to provide the FTC with a flexible weapon against novel forms of anticompetitive conduct. See H.R. REP. NO. 1142, 63d Cong., 2d Sess. (1914); REP. NO. 597, 63d Cong., 2d Sess. (1914). For commentaries on this history, see HENDERSON, *THE FEDERAL TRADE COMMISSION* (1927); Austern, *The Parentage and Administrative Ontogeny of the Federal Trade Commission*, 1955 N.Y.S.B.A. ANTITRUST LAW SYMPOSIUM 83; Baker & Baum, *Section 5 of the Federal Trade Commission Act: A Continuing Process of Redefinition*, 7 VILL. L. REV. 517 (1962); Votaw, *Antitrust in 1914: The Climate of Opinion*, 24 A.B.A. ANTITRUST SECTION 14 (1961). But see Posner, *The Federal Trade Commission*, 37 U. CHI. L. REV. 47 (1969).

153. *FTC v. Motion Picture Adv. Co.*, 344 U.S. 392, 396 (1953). See also *FTC v. Texaco*, 393 U.S. 222, 225 (1968).

## Automobile Industry

on review to "determining whether the Commission's decision has warrant in the record and a reasonable basis in law."<sup>154</sup> It has ruled that to be "unfair," conduct need not violate other antitrust laws, but must merely "conflict with the basic policies of the Sherman and Clayton Acts."<sup>155</sup> To give meaning to this general standard, the Court has upheld FTC findings of "unfair" practices when their anticompetitive impact as determined by the Commission was characteristic of conduct already proscribed under Sherman and Clayton Act standards.<sup>156</sup> Thus, the Court could be expected to uphold an FTC finding

154. *Atlantic Refg. Co. v. FTC*, 381 U.S. 357, 367-68 (1965).

155. *FTC v. Brown Shoe Co.*, 384 U.S. 316, 320-321 (1966). See also similar statements in *FTC v. Motion Picture Advertising Serv. Co.*, 341 U.S. 392, 394-95 (1953); *Atlantic Ref. Co. v. FTC*, 381 U.S. 357, 369 (1965). The judicial application of Section 5 falls into five separate categories. (1) Sherman Act violations: see, e.g., *FTC v. Beech-Nut Packing Co.*, 257 U.S. 441 (1922) (resale price-maintenance); *FTC v. Pacific States Paper Trade Ass'n*, 273 U.S. 52 (1927) (price fixing conspiracy); *Fashion Originators' Guild v. FTC*, 312 U.S. 457 (1940) (group boycott); *FTC v. Cement Institute*, 333 U.S. 683 (1948) (delivered pricing conspiracy). (2) Section 3 Clayton Act violations: see, e.g., *Fashion Originators' Guild v. FTC*, 312 U.S. 683 (1940); *Times-Picayune Publishing Co. v. United States*, 315 U.S. 594 (1953) (tie-in); *Oppenheim, Guides to Harmonizing Section 5 of the Federal Trade Commission Act with the Sherman and Clayton Acts*, 50 Mich. L. Rev. 821 (1961). (3) Practices characteristic of but falling short of Sherman Act violations and Section 3 Clayton Act violations: see, e.g., *FTC v. Motion Picture Advertising Service Co.*, 344 U.S. 392 (1953) (quasi-monopolistic exclusive contracts); *Atlantic Ref. Co. v. FTC*, 381 U.S. 357 (1965) (quasi-tying arrangements); *FTC v. Brown Shoe Co.*, 384 U.S. 316 (1966) (quasi-exclusive dealing franchise agreements); Comment, *Per Se Rules and Section 5 of the Federal Trade Commission Act*, 54 CALIF. L. REV. 2049 (1966). (4) Practices characteristic of but not explicitly prohibited by the Robinson-Patman Act: see, e.g., *Grand Union Co. v. FTC*, 300 F.2d 92 (2d Cir. 1962) (customer induced promotional allowances); *R.H. Macy & Co. v. FTC*, 326 F.2d 445 (2d Cir. 1964) (coerced contributions from vendors); *Rahl, Does Section 5 of the Federal Trade Commission Act Extend the Clayton Act?* 5 ANTITRUST BULL. 533 (1960). (5) Practices characteristic of but not explicitly proscribed by Section 7 of the Clayton Act: see, e.g., *Beatrice Foods Co. 1965-1967 Transfer Binder Trade Reg. Rep. ¶ 17,244* (FTC 1965) (noncorporate acquisition); *Dean Foods Co. 1965-1967 Transfer Binder Trade Reg. Rep. ¶ 17,763* (FTC 1966) (purchase agreement an unfair method of competition).

156. In *Brown Shoe* and *Atlantic Refining*, for example, it upheld the FTC's proscription of practices which accomplished the same anticompetitive end as exclusive dealing and tying arrangements, respectively (i.e., market foreclosure), but which violated neither the Sherman nor Clayton Act. In *Atlantic Ref. Co. v. FTC*, 381 U.S. 357 (1965), the Supreme Court held that the FTC was warranted in finding a sales-commission plan between a gasoline distributor and a major tire manufacturer an unfair trade practice because although not a tying agreement, "the effect of this plan is similar to a tie-in." 381 U.S. at 371. The arrangement condemned here involved Atlantic's sponsoring of Goodyear-supplied tires, batteries, and accessories to Atlantic's wholesalers and retail dealers. This arrangement has been termed a "quasi-tying agreement" because Atlantic did not manufacture the tied product, although it received a commission on dealers' purchases. See Comment, *Per Se Rules and Section 5 of the Federal Trade Commission Act*, 54 CALIF. L. REV. 2049, 2055-63 (1966). In *FTC v. Brown Shoe*, 381 U.S. 316 (1966), the Court found that respondent's franchise program, by effectively foreclosing competitors from selling to a substantial number of retail shoe dealers, "obviously conflicts with the central policy" of the Sherman and Clayton Acts, 384 U.S. at 321. Here a franchise agreement, whereby Brown agreed to give valuable services to independent retail stores in exchange for the latter's contractual promise to deal "primarily" in Brown shoes, was held an unfair method of competition. This agreement has been termed a "quasi-exclusive dealing" arrangement because of the absence of the usual promise from the dealer not to handle any goods which compete with those of the seller. See Comment, *supra*, at 2066-68. But see *FTC v. Sperry & Hutchinson Co.*, 432 F.2d 146 (5th Cir. 1970), cert. granted, 39 U.S.L.W. 3424 (U.S. Mar. 30, 1971) (No. 1278).

that annual style change as interdependently pursued by the Big Three violated Section 5 if the Commission demonstrated that in the automobile industry this practice had accomplished the same anticompetitive ends as had recognized antitrust violations.

Part I of this Note established that the premise of antitrust legislation was unequivocally competition and that persistently high structural concentration and accompanying high barriers to entry are inimical to that objective. It suggested that certain forms of conduct could produce these anticompetitive structural features. Part II demonstrated that as pursued interdependently by the Big Three annual style change seemed to be conduct of this kind. As suggested above, the broad legislative mandate underlying Section 5 of the Federal Trade Commission Act was that concentration-increasing practices be identified and proscribed as "unfair." The case law under Section 5, however, requires analogy to antitrust violations. It will now be argued that the impact of annual style change upon industry concentration and entry barriers is sufficiently analogous to the structural impact of excessive promotional expenditures, predatory pricing and spending activities, and monopolistic practices to warrant a finding of illegality under Section 5.

The impact of any particular practice upon industry concentration can be factually demonstrated to a reviewing court by proving the extent to which it increases the market shares of the leading firms and increases the height of barriers to entry.<sup>157</sup> The issue of illegality, however, may pose a more difficult problem because it necessitates a determination of the threshold beyond which concentration and barriers to entry become clearly anticompetitive and the practices producing them may be termed "unfair." An abundance of economic evidence suggests that when 50 per cent or more of an industry's total sales is concentrated in four firms, and substantial barriers to entry are raised against newcomers, the survival of effectively competitive conduct and performance in that industry is highly improbable.<sup>158</sup> Consequently, while the question of threshold illegality might arise in other industrial contexts, it need not unduly concern a court reviewing competition in the automobile industry. As noted earlier, with three firms sharing 97 per cent of total domestic sales and without a successful newcomer in nearly fifty years, this industry is one of the most highly concentrated and entry-resistant enterprises in American manufac-

157. See note 3 *supra*.

158. See p. 569 *supra*.

## Automobile Industry

turing. In short, if it could be shown that annual style change produced a high level of concentration and engendered substantial entry barriers and that these two structural effects could be analogized to results arising from other practices proscribed under the antitrust laws, there would be no problem in deciding that the degree of concentration and the height of entry barriers in the automobile industry were sufficient to warrant a finding of a Section 5 violation.

### A. *The Analogy of Style Change to Excessive Promotional Expenditures: The American Tobacco and Clorox Cases*

Excessive promotional expenditures, those which might increase concentration beyond the tight oligopoly threshold (*i.e.*, four firms with persistently 50 per cent or more of industry sales), have been banned under the antitrust laws when they occurred in the context of collusion or merger. By vastly increasing the countervailing selling costs required for entry or survival in the market in which they are employed, promotional expenditures of large magnitude may threaten the existence of actual competitors and deter potential entrants.<sup>159</sup> Arguably, annual style change has an analogous impact upon actual and potential competitors in the automobile industry. Indeed, it has been suggested above that annual restyling may not only raise selling costs by requiring massive readvertising and retooling each year, but it also may increase distribution costs by requiring the establishment of a nationwide retail network and may increase production costs by requiring higher volumes of output.

Although the Supreme Court has never explicitly held that heavy promotional expenditures *per se* constitute an antitrust violation, it has recognized their anticompetitive implications when undertaken as a result of collusion or merger in Sherman and Clayton Act cases, respectively. As early as 1946, the Court noted that "tremendous advertising" outlays had been used by the Big Three cigarette manufacturers to foreclose new entry.<sup>160</sup> In *American Tobacco*, it affirmed the convictions of American, Liggett and Reynolds for conspiracy to monopolize in violation of Sections 1 and 2 of the Sherman Act.<sup>161</sup> Although these defendants had engaged in several exclusionary activities, including predatory price cutting and coercive purchasing programs, the Court placed substantial emphasis upon their \$40 million annual advertising

159. See Smith, *supra* note 2, at 51-52; Turner, *Advertising and Competition*, 26 FED. BAR J. 93 (1966); Mueller, *supra* note 89.

160. *American Tobacco Co. v. United States*, 328 U.S. 781, 797 (1946).

161. *Id.*

campaigns, finding that this activity required entrants to engage in equally massive and costly countervailing advertising. It concluded that to a considerable extent, the Big Three had preserved their two-thirds share of the tobacco industry by wielding a "powerful offensive and defensive weapon against new competition" which had served to warn any prospective competitor that it "dare not enter such a field, unless it be well supported by comparable national advertising."<sup>162</sup>

Of course, the practices condemned in *American Tobacco* are not precisely similar to the phenomenon of style change in the automobile industry. The former involved only advertising, whereas, the latter includes several additional activities which inflate entry costs. Moreover, conduct was pursued differently in these two cases. Unlike the leading automobile producers, the three largest cigarette manufacturers had acted in concert. Furthermore, the Court's statements concerning their promotional expenditures were dicta given the evidence of overtly predatory pricing practices.

Nonetheless, the concentration-increasing impacts of the cigarette and automobile firms' conduct are analogous. Although annual style change was pursued interdependently by the Big Three automobile companies, it could scarcely have served as a more effective deterrent to new entry had it been pursued in concert. In fact, annual restyling by the leading automobile producers very likely exceeded the deterrent capacity of the tobacco firms' advertising expenditures.<sup>163</sup> Thus, by analogy to the anticompetitive structural impact of advertising in *American Tobacco*, annual style change in the automobile industry would seem to constitute an "unfair method of competition" under Section 5.

In 1967, this time in the context of a Clayton Act Section 7 merger

162. *Id.*

163. Assuming, for example, that the costs of countervailing promotion might equal the established firms' collective promotional efforts, a newcomer would be at least ten times more able to meet the entry costs generated by the three tobacco firms' \$40 million expenditures than those resulting from the Big Three's \$400-\$600 million advertising campaigns. The upper range of advertising expenditures was obtained by multiplying Lantini's \$75 per car figure (see note 115 *supra*) by the Big Three's current collective output of 7.98 million vehicles. STANDARD & POOR, *supra* note 18, at A161. The lower advertising estimate was based on advertising expenditures in selecting media for 1968 reported by STANDARD & POOR, *id.* at A170. Moreover, a firm contemplating entry into the automobile industry would encounter the additional costs and risks associated with requisite backward and forward integration as well as annual retooling expenditures.

That annual style change may have actually exerted a greater anticompetitive impact on the structure of the automobile industry than that of heavy advertising on the structure of the cigarette industry may be seen in the concentration trends of the two markets. From 1931 until the time of suit in 1939, the three cigarette firms' collective market share dropped from 91 to 68 percent. 328 U.S. 781 at 795. During that same period, the leading three automobile companies' share rose from 81 to 90 percent. FTC REPORT, *supra* note 21, at 29, 1058.

## Automobile Industry

case, the Court reiterated its concern that advertising resources might be used by dominant firms in a tight oligopoly to increase and/or preserve high concentration. In *FTC v. Procter & Gamble Co.*, it upheld a Commission finding that Procter & Gamble's conglomerate acquisition of Clorox Chemical Co., the leading manufacturer of household liquid bleach, might substantially lessen competition or tend to create a monopoly in the production and sale of liquid bleach.<sup>164</sup> At the time of the acquisition, Clorox and one other firm accounted for 65 per cent of industry sales, and with four other firms, for almost 80 per cent.<sup>165</sup> In this already tightly concentrated industry, the Court held that Procter's acquisition of Clorox might increase concentration further or at least prevent possible deconcentration by raising barriers to entry. It specifically held that Procter's postmerger ability to divert a large portion of a promotional budget exceeding \$120 million to meet the short term threat of attempted entry created a formidable obstacle to newcomers.<sup>166</sup> Moreover, it intimated that the substitution of the powerful Procter for the smaller but dominant Clorox might lead to promotional competition which would eliminate the remaining smaller firms in this industry.<sup>167</sup>

Although the Court's acknowledgement in *Clorox* of the anticompetitive implications of excessive promotional expenditures arose in the context of a merger, the holding might best be explained in terms of tight oligopoly structure. The Clorox-Procter merger had not been a horizontal merger of competitors but instead a conglomerate product extension. The Court was primarily concerned not with the elimination of competition by merger but with the postmerger impact that Procter's advertising resources might have upon concentration in the tightly oligopolistic bleach industry. Regardless of how the giant Procter had entered this industry, *i.e.*, whether *de novo* or via merger, its enormous promotional resources threatened to increase concentration by eliminating smaller firms and raising barriers to entry.

Viewed from this perspective, the situation the Court feared in *Clorox* begins to approach the factual setting of annual style change in the automobile industry. In both situations, competitive industry structure is threatened by the concentration-increasing conduct of dominant firms. Annual style change by the Big Three, no less than Procter's advertising advantages, might have raised selling costs above the level

164. *FTC v. Procter & Gamble Co.*, 386 U.S. 563 (1967).

165. *Id.* at 571.

166. *Id.* at 573, 579.

167. *Id.* at 578.

tolerable for smaller actual and potential competitors. In fact, the former conduct seemed to produce the greater anticompetitive impact. For example, were Procter to have devoted its entire \$120 million promotional budget to thwarting attempted entry, a newcomer to the liquid bleach industry would have confronted a barrier one-third as costly to surmount as that erected by the Big Three's collective advertising efforts.<sup>168</sup> Moreover, annual style change arguably occasioned more than massive advertising in the automobile industry; it might very well have led to the several other entry-detering developments described earlier. Finally, in the automobile industry, unlike in *Clorox*, the anticompetitive impact quite possibly was real rather than merely potential. Annual style change may have actually eliminated nearly one hundred smaller producers. By contrast, the Court ordered Procter's divestiture of *Clorox* on the basis of a concentration-increasing impact that could *potentially* result were Procter to employ its promotional resources as a weapon against actual and prospective competitors. By reason of its arguably real and more formidable impact upon the competitive structure of the automobile industry, annual style change would seem to warrant condemnation as "unfair" under Section 5.

In *American Tobacco* and *Clorox*, the Court acknowledged that in highly concentrated industries excessive promotional expenditures whether actually undertaken by collusive oligopolists or merely threatened by a merger partner could seriously impair competitive structure. More recently, antitrust commentators have argued that excessive advertising *per se* by leading firms in a tight oligopoly should be proscribed under Section 5 because it can vitiate competitive structure and performance to the same extent as more common forms of concentration-increasing activities such as mergers.<sup>169</sup> One study has concluded:

To be sure, there can no longer be any serious doubt about the capacity of certain kinds of advertising, pursued with sufficient intensity, to bring about a massive restructuring of an industry, to "concentrate" its sales volume in the hands of two or three firms and thus to impose on the consuming public all the ills the law has long recognized as being associated with inordinately high concentration ratios. In a situation where advertising has *in fact* been used to achieve this kind of result, it should enjoy no more immunity from the antitrust laws than any other kind of concentration-increasing behavior.<sup>170</sup>

## Automobile Industry

This argument would seem to apply with even greater force to the concentration-increasing activities engendered by the Big Three's annual automobile restyling policy.

**B. *The Analogy of Style Change to Predatory Price Cutting: Standard Oil and "Predatory Spending"***

The anticompetitive impact of annual restyling on industry structure is also similar to that produced by the recognized antitrust violations of predatory pricing and spending. Of course, these latter violations differ by nature from style change in that they involve some form of "predatory intent," whereas no such element has been discovered in various studies of the automobile industry.<sup>171</sup> Nevertheless, the effects of all three practices on competitive structure are fundamentally analogous.

Prolonged sales by powerful firms at prices below out-of-pocket costs are banned as predatory when they drive out competitors or bar new entry. This practice is illegal because it enables firms with vast financial resources to outlast smaller competitors and ultimately to reap the abnormally high profits associated with high industry concentration. Such "predatory price cutting" has been proscribed as an attempt to monopolize by the Sherman Act since the landmark *Standard Oil of New Jersey v. United States* decision of 1911<sup>172</sup> and has been recently condemned as a Robinson-Patman Act violation in *United States v. National Dairy Products Corp.*<sup>173</sup>

Similarly, excessive spending by huge manufacturers which requires countervailing expenditures that are unprofitable for smaller competitors has been regarded as predatory when it results in heightened concentration by excluding actual or potential competitors.<sup>174</sup>

171. See note 27 *supra*.

172. *Standard Oil Co. of New Jersey v. United States*, 221 U.S. 1 (1911).

173. *United States v. National Dairy Products Corp.*, 372 U.S. 29 (1963). For recent manifestations of concern regarding predatory pricing, see *Reynolds Metals Co. v. FTC*, 309 F.2d 223 (D.C. Cir. 1962); *Foremost Dairies, Inc. v. FTC*, 348 F.2d 674 (5th Cir. 1965), *cert. denied* 382 U.S. 959 (1965); *Forster Mfg. Co. v. FTC*, 335 F.2d 47 (1st Cir. 1964), *cert. denied* 380 U.S. 906 (1965).

174. See Turner, *Conglomerate Mergers and Section 7 of the Clayton Act*, 78 HARV. L. REV. 1313, 1345-46 (1965); P. AREEDA, *ANTITRUST ANALYSIS* 519-20 (1967). Indeed, careful study of the *Standard Oil* case revealed no evidence of that predatory tactic. See McGee, *Predatory Price Cutting: The Standard Oil (N.J.) Case*, 1 J. LAW & ECON. 137 (1958). Predatory promotional spending, however, is beginning to be recognized by the courts. An allegation that "excessive advertising expenses" and rapid product modification has been employed to drive out competition survived a motion to dismiss in *Bailey's Bakery, Ltd. v. Continental Baking Co.*, 235 F. Supp. 705 (D. Hawaii 1964), *aff'd per curiam*, 401 F.2d 182 (9th Cir. 1968), *cert. denied* 393 U.S. 1086 (1969). By "predatory" nothing more is meant than the effect of unnecessarily impairing competition by raising barriers to new entry. No specific intent to exclude is implied, although it may very well exist. *E.g.*, refer to the

Predatory spending is an even more effective exclusionary weapon than predatory price cutting. Market strategies predicated upon price cutting are economically viable only if the surviving firm can recoup its losses through excessive profits obtained by pricing well above the competitive level. But these abnormally high profits will very likely bring new competition back into the field. A predatory price-cutter, therefore, might not be free from new entry for the length of time necessary to permit recovery of its original losses.<sup>175</sup> By contrast, a predatory spender not only drives out competitors unable to keep up, it also deters new competition by raising barriers to entry.<sup>176</sup>

Significantly, annual style change appears to be more closely analogous in anticompetitive impact to predatory spending than price cutting. As indicated earlier by the preliminary analysis of the automobile industry, this practice seemed responsible both for the elimination of smaller producers and the deterrence of firms attracted to the industry's extraordinarily high rates of return. In short, annual restyling is similar to predatory spending in that both practices increase concentration by setting expenditure rates at levels in excess of what either smaller producers or newcomers could afford.

Although the Supreme Court has never explicitly dealt with a case involving only allegations of predatory spending,<sup>177</sup> it has implied that this practice might violate the Sherman Act since its decision in the early *United States v. American Tobacco Co.* case of 1911.<sup>178</sup> In that case, it found as evidence of predatory intent American Tobacco's "persistent expenditure of millions upon millions of dollars in buying out plants, not for the purpose of utilizing them, but in order to close them up and render them useless for the purposes of trade"; the Court held that this firm had attempted to monopolize and had in fact monopolized the tobacco industry in violation of the Sherman Act.<sup>179</sup>

In *Tobacco*, the Court found that expenditures for the purchase and scrapping of plants helped achieve and preserve an extreme degree of concentration by eliminating potential as well as actual competition.

monopolization cases of *United Shoe* and *Alcoa* where practices "natural and normal" and "honestly industrial" were found nevertheless to discourage new entry unlawfully, *United States v. United Shoe Machinery Corp.*, 110 F. Supp. 295, 344-45 (D. Mass. 1953), *aff'd per curiam*, 347 U.S. 521 (1954); *United States v. Aluminum Co. of America*, 148 F.2d 416, 431 (2d Cir. 1945).

179. *Id.* at 183.

## Automobile Industry

Unable to acquire existing tobacco facilities, prospective entrants were compelled to invest in the construction of new plants. Indeed, a similar form of predatory spending characterized the *United States v. Aluminum Co. of America* case.<sup>180</sup> There, Judge Learned Hand ruled that Alcoa's anticipation of increases in demand for aluminum by doubling and redoubling its capacity excluded new competition in violation of the Sherman Act.<sup>181</sup> In both *Tobacco* and *Alcoa*, the costs of survival and entrance were heightened by the established firms predatory spending programs.

Of course, *Standard Oil*, *Tobacco* and *Alcoa* all involved monopolists; automobile manufacturing is dominated by oligopolists. But this difference in the degree of structural concentration achieved does not negate a basic similarity in the anticompetitive impact of the conduct involved. By excluding competitors and raising barriers to entry, annual style change by the Big Three may have been as effective in creating a tight oligopoly in the automobile industry as price cutting by Standard or predatory spending by American and Alcoa were in establishing monopolies in the oil, tobacco and aluminum industries, respectively. Indeed, the Big Three's annual \$400-\$600 million advertising campaigns, their \$1.5 billion annual restyling expenditures, and their past investment of billions of dollars in backward and forward integration might approach if not equal the anticompetitive structural consequences of the spending programs proscribed in *Tobacco* and *Alcoa*.<sup>182</sup> The predatory pricing and spending programs of the monopolists in these three cases resulted in Sherman Act violations. Accordingly, the similarity in anticompetitive impact of annual automobile style change with that of predatory pricing and spending provides another justification for the FTC declaring this practice "unfair" under Section 5.

### C. *The Analogy of Style Change to Monopolistic Practices: The Motion Picture Advertising Decision*

The implication of annual restyling by the Big Three for competitive industry structure is also analogous to that of monopolistic practices which have been declared "unfair methods of competition"

180. 148 F.2d 416 (2d Cir. 1945).

181. *Id.* at 431.

182. See note 163 *supra* for advertising computation. Regarding the Big Three's annual restyling expenditures, see note 45 *supra*. Their combined investment in integrated production and distribution facilities as of 1970 has been reported as amounting to nearly \$30 billion. STANDARD & POOR, CORPORATION RECORDS 1434, 1468, 2471 (June 1970).

under Section 5. When pursued interdependently by firms effectively sharing monopoly power, both forms of conduct tend to preserve if not increase high concentration by eliminating competitors with smaller market shares.

In *FTC v. Motion Picture Advertising*, for example, the Supreme Court held that an advertising film company, with 40 per cent of the relevant market, together with its three major nondefendant competitors, had collectively monopolized 75 per cent of the advertising film industry by jointly, although noncollusively, negotiating similarly exclusive contracts with theater owners.<sup>183</sup> Since the theater owner was paid to display these films, the exclusive dealing prohibition of Section 3 of the Clayton Act was inapplicable.<sup>184</sup> Moreover, respondent's less-than-dominant market position precluded a charge of monopolization under the Sherman Act. Instead, the Court treated the four jointly-acting firms as one and weighed the collective impact of their conduct on the advertising film industry's structure. It accepted the FTC's finding that this shared conduct had foreclosed to competitors all but 25 per cent of the available outlets for this business in the country and had resulted in the exit of several smaller film distributors.<sup>185</sup> Consequently, it held that "a device which has sewed up a market so tightly for the benefit of a few" constituted an "unfair method of competition" within the meaning of Section 5.<sup>186</sup>

In effect, the Court in *Motion Picture Advertising* analogized the anticompetitive impact of the four oligopolists' exclusive contracts to that which would have resulted had the contracts been unilaterally undertaken by a single monopolist. The latter situation, of course, would have provided the basis for a Sherman Act monopolization charge. Given this similarity in the collective concentration-increasing effects of the advertising firms' conduct, therefore, with that of a recognized antitrust violation, *Motion Picture Advertising's* contracts were held "unfair" under Section 5.

Annual style change by the three leading automobile companies, like the exclusive contracts of these four advertising film firms, arguably excludes competitors and increases concentration. It would thus seem to fall well within the analysis employed in *Motion Picture Advertising*. If General Motors, for example, managed to increase its

183. 341 U.S. 392 (1953).

184. This section makes unlawful a lease, sale, or contract for sale which substantially lessens competition or tends to create a monopoly. 15 U.S.C. § 14 (1964).

186. *Id.* at 399.

## Automobile Industry

current market share to monopoly proportions and to preserve this position by accelerating the rate and extent of its style variations, a charge of monopolization under the Sherman Act would lie. Yet, if GM, Ford and Chrysler effectively share monopoly power and jointly deter new competition through annual variations in automobile styles, the consequences are as anticompetitive as if any one of these firms alone possessed monopoly power. Here, as in *Motion Picture Advertising*, the similarity in impact with that of a Sherman Act monopolization can be demonstrated. The results, therefore, should be the same: annual style change should be declared an "unfair method of competition" in the automobile industry.

The anticompetitive, concentration-increasing impact of annual style change by the Big Three in the automobile industry matches and surpasses that of several practices proscribed under the Sherman and Clayton Acts when undertaken by dominant firms: excessive promotional expenditures, predatory pricing and spending, monopolistic conduct. This analogy in terms of the comparable structural consequences of style change to recognized antitrust violations is all that is required for a Section 5 violation.

For over thirty years, the FTC has been aware that annual automobile restyling was impairing the competitive structure of this industry. In 1939, an FTC report recounted the marked decrease in the number of passenger car manufacturers and noted that the "introduction of yearly models, and the increasing importance of the style factor, the large amount of capital required to finance new models in good and bad years, all favored the large manufacturing company with huge capital and equipment resources."<sup>187</sup> Detailed examination of annual restyling practices undertaken by GM, Ford and Chrysler as an unfair method of competition under Section 5 would appear long overdue. Only the FTC's political or administrative paralysis would seem to stand in the way of bringing a well-founded antitrust suit against the automobile manufacturers.<sup>188</sup>

187. FTC REPORT, *supra* note 21, at 26.

188. For a recent attack upon the FTC's failure to divest GM, with the consequent loss in consumer savings of several billion dollars a year in lower automobile prices, see *Foreword* to 2 ANTIT. LAW & ECON. REV. 13-15 (Summer 1969). The Justice Department has also been severely criticized for its unwillingness to prosecute the passenger car industry. Indeed, it has failed to take any action despite its preparation of a 104 page complaint in 1966 charging GM with having violated sections 1 and 2 of the Sherman Act and section 7 of the Clayton Act. Significantly, the proposed suit alleged among other items that the effect of GM's annual restyling since the 1920's upon competitors was "obvious and dramatic." It declared further that "[t]ools and dies for new models are high-cost items that GM's smaller competitors can less easily afford." *Wall Street Journal*, October 31, 1967, at 24, col. 3. But see the FTC's recent complaint against the nation's five leading tire manufac-

#### IV. Some Considerations Regarding Relief

In antitrust, providing an adequate remedy is as important as proving the antitrust violation. Were style changing by automobile manufacturers found to violate Section 5, the formidable task of devising appropriate relief would still remain. Two different approaches suggest themselves which will be only briefly outlined here: structural dissolution of the Big Three or a moratorium on their annual style changes.

##### A. *The Appropriateness of Structural Dissolution*

If the preliminary economic analysis proves to be correct, restoration of competition to the automobile industry would require structural dissolution of the Big Three into independent assembly, manufacturing and distribution facilities. As discussed in Part II, GM's 1923 introduction of annual style change revolutionized this industry's structure. By giving rise to components integration, heavy advertising, franchised distribution and enormous capital requirements, it transformed an industry of numerous assemblers to one dominated by three completely integrated firms. In their drive to achieve full integration backward into manufacturing and forward into distribution, the Big Three have either acquired or eliminated the vast majority of companies which assembled cars, the manufacturers of automotive parts, and the independent wholesale/retail distributors. Dissolution would reverse this process. It might undo what more than four decades of annual style change have accomplished: a fully integrated, highly concentrated, anticompetitive industry structure.

The remedy of divestiture as applied to the automobile industry raises two important issues: is it economically feasible in an oligopoly setting and is it legally justifiable under Section 5?

Divestiture in oligopoly is no less feasible than in monopoly.<sup>189</sup> In both cases, feasibility depends upon the absolute size of the firm relative to economies of scale. Absent annual restyling requirements of integrated components production, technical efficiencies in the assembly

turers charging that their similar leasing agreements with bus companies enabled respondents to dominate the bus-tire market. In a significant break with precedent, however, the tire manufacturers were accused not of collusion, but of interdependently pursuing "parallel courses of business conduct constituting unfair methods of competition" under Section 5. 3 Trade Reg. Rep. ¶ 19,381 at 21,511. Moreover, the FTC is currently engaged in an investigation of the structure, conduct and performance of the automobile industry. 3 ANTITRUST L. & ECON. REV. 14-15 (Winter 1969-70).

189. Turner, *supra* note 33, at 1231 n.45.

## Automobile Industry

of automobiles could be achieved at any level of output greater than 60,000 units per year. At this volume, performance capabilities could still be efficiently improved through the purchase and assembly of specially tooled parts from external suppliers. Significantly, the average annual output of the Big Three's 45 assembly plants is approximately 177,000 cars per plant.<sup>190</sup> Divesting GM, Ford and Chrysler of all but one of their respective assembly facilities, therefore, would provide plants with capacities well in excess of the efficiency threshold for 42 new producers.<sup>191</sup> Spin-off of the Big Three's parts and distribution facilities, moreover, would enable these competitors to assemble automobiles with improved performance capabilities from components supplied by a variety of independent parts manufacturers and sold through independent distributors. Consequently, economists have generally concluded that dissolution would not lessen the efficiency with which automobiles are produced.<sup>192</sup> On the contrary, they argue that it would lead to increased efficiency.<sup>193</sup>

Divestiture would also appear to be legally justifiable under Section 5. The Supreme Court has apparently sanctioned the FTC's use in Section 5 proceedings of this and other remedies designed to effect structural reorganization.<sup>194</sup> Although in the past, courts rarely imposed this drastic sanction, more recently the Supreme Court has indicated that such reluctance is unwarranted when other remedies alone could not adequately dissipate undue market concentration resulting from a proscribed activity.<sup>195</sup> Accordingly, if the impact of annual style change on the structure of the automobile industry has been as profound as suggested above, structural reorganization through divestiture might be warranted.

190. General Motors operates 23 assembly plants; Ford operates 15 and Chrysler 7 such facilities. AUTOMOTIVE NEWS, ALMANAC ISSUE 68 (1979). Given the Big Three's current (1969) production at 7.98 million (note 45 *supra*), each assembly plant produces an average of 177,000 units per year.

191. The Big Three would each operate a single assembly facility thereby freeing their other 42 plants for operation by new competitors.

192. Schupack, 1968 Hearings, *supra* note 20, at 921. See also, ADMINISTERED PRICES, *supra* note 43, at 15.

193. See, e.g., Loescher, 1968 Hearings, *supra* note 20, at 915.

194. Whatever doubts may have existed concerning the extent of the Commission's remedial authority under section 5, they seem to have been firmly resolved in favor of according this agency the complete array of powers of a court of equity "including divestiture and other remedies designed to effect structural reorganization." *Ekon Prods. Co.* [1963-65 Transfer Binder] TAXID. REP. ¶ 16,879, at 21,901 (F.T.C. 1964), *aff'd* 347 F.2d 745 (7th Cir. 1965). See the Supreme Court's apparent recognition and sanction of this position in *Pan American World Airways v. United States*, 371 U.S. 296, 312 n.17 (1963) and *United States v. Philadelphia National Bank*, 374 U.S. 321, 339-40 n.17 (1963).

195. E.g., *United States v. du Pont & Co.*, 366 U.S. 316 (1961); *United States v. Aluminum Co. of America*, 377 U.S. 271 (1964); *Maryland & Virginia Milk Producers Ass'n v. United States*, 362 U.S. 458 (1960).

Dissolution of the Big Three along the lines suggested would not only be economically feasible and legally justifiable, it would also be competitively beneficial. It would substantially reduce entry barriers by weakening the market power of the leading producers. Under these eased entry conditions, economists have estimated that more than 100 additional firms could enter and compete effectively in the automobile industry.<sup>196</sup>

#### B. *A Moratorium on Annual Style Change*

Although economically feasible and legally justifiable, dissolution of the Big Three might nevertheless be precluded by political considerations. In that case, the FTC might wish to devise less drastic remedies specifically directed at the "unfair" practice. It might, for example, order a fixed term moratorium on all automobile style changes by the Big Three. Presumably, it would except performance modifications from its decree. As noted in Part I, the Bureau of Labor Statistics currently distinguishes between style changes (such as varying amounts of chromium and contour trim, changing body shell patterns and radiator grill designs) and performance changes (modifications of safety, efficiency, comfort or durability).<sup>197</sup> By framing its injunctive relief in terms of BLS criteria, the FTC could interdict anticompetitive annual style changes without affecting safety modifications or technological innovations.

A moratorium on style changes, however, might not be sufficient. Absent dissolution, new competition will emerge in the automobile industry only as a result of new entry. But proscribing annual restyling by the Big Three would not eliminate all the obstacles to entry which

196. Loescher in *1968 Hearings*, *supra* note 27, at 915. New companies could enter more easily and compete with those formed through dissolution of the Big Three's assembly facilities. See note 191 *supra*. These new producers, like those created by divestiture, would be able to obtain components and accessories from the independent suppliers created through spin-off. See p. 609 *supra*. They would be able to dispose of their products through dealers who were no longer pressured to deal exclusively with a single dominant firm. Finally, they would not need to undertake massive retooling and re-advertising expenditures annually. *Id.*

By breaking up existing firms and encouraging new ones to enter, divestiture would improve competitive market performance. If a dozen firms of similar size replaced the current industry structure, there is evidence that the average ratio of price to cost would be substantially reduced, thereby enhancing efficiency. Loescher in *1968 Hearings*, *supra* note 20, at 915. Likewise, it has been suggested that an industry of from 15 to 30 firms would greatly advance the rate of technological innovation and result in a wider variety of automobiles. Schupack, in *1969 Hearings*, *supra* note 24, at 541. On the basis of these expectations, an automobile industry of perhaps 100 or more producers would contribute immeasurably to this industry's performance. This is the industry which dissolution would engender.

197. See pp. 575-76 *supra*.

## Automobile Industry

have resulted from more than four decades of this practice. It would not, for example, recreate the independent distributors and parts manufacturers which no longer exist but which are indispensable to entry by nonintegrated firms. Consequently, additional relief would be necessary to provide prospective entrants with access to these facilities.

In fashioning supplemental relief to encourage the re-emergence of parts manufacturers and nonfranchised or factory owned distributors, the FTC could rely on ample precedents. It is well settled that in order to restore competitive conditions, the Commission may under Section 5 forbid acts lawful in themselves or compel affirmative acts of compliance.<sup>198</sup> To facilitate the growth of parts suppliers, for example, it could impose purchasing requirements upon the Big Three similar to those commonly contained in antitrust consent decrees. Such a requirement was included in a consent judgment entered in 1964 against American Cyanamid, a manufacturer of laminated melamine products which had integrated back into melamine production and with several co-conspirators had restrained competition in violation of Sherman and Clayton Act provisions.<sup>199</sup> To enhance entry opportunities for prospective non-integrated laminators, the decree encouraged the development of new sources of melamine supply. It did this by ordering American Cyanamid to purchase a specified amount of melamine from external suppliers.<sup>200</sup> Moreover, it imposed limitations upon the defendant's own production of this material.<sup>201</sup>

Similarly, the FTC could order the Big Three to freeze components production at current levels and purchase additional parts necessary for anticipated increases in automobile demand from external suppliers. Since industry sales forecasts indicate that demand should rise by more than 40 percent by 1975, future orders from the Big Three would constitute a certain and sizeable market for new parts manufacturers.<sup>202</sup> A reappearance of independent components firms would reduce, in turn, the backward integration requirements that bar entry by new automobile producers.

Alternatively, the FTC might simply order the Big Three to sell

198. See, e.g., Ekco Prods. Co., [1963-65 Transfer Binder] TRADE REG. REP. ¶ 16,879, at 21,905 (F.T.C. 1961).

199. United States v. American Cyanamid Co., 1964 Trade Cas. 79,628 (S.D.N.Y.). See also marketing orders used in lieu of divestiture in Simpson Timber Co., 60 F.T.C. 43 (1962) and Gulf Oil Corp., 56 F.T.C. 688 (1960). But see a criticism of such orders when used as a substitute for structural relief, Elzinga, *The Antimerger Law: Pyrric Victories*, 12 J. Law & Econ. 43, 66-71 (April 1969).

201. *Id.* at 79,631.

202. STANDARD & POOR, *supra* note 18, at A159.

parts to entering firms on a nondiscriminatory basis. Presumably, this entry of new automobile producers would be soon accompanied by the emergence of independent parts manufacturers seeking to supply the entering assemblers. When this occurred, the order could be rescinded.

With respect to other obstacles arguably occasioned by style change, the Commission could devise similarly specific relief. It could greatly alleviate the problem of achieving nationwide distribution, for instance, by requiring that the Big Three's franchised dealers carry the products of entering firms.<sup>203</sup> Moreover, it could reduce countervailing advertising requirements by setting limitations on the amount of annual advertising expenditures that the Big Three may undertake.<sup>204</sup>

Ideally, a style change moratorium accompanied by supplemental equitable relief would attract new firms formerly incapable of overcoming the obstacles established by annual restyling. In any event, jurisdiction could be retained by the court to permit either the FTC or the defendants to move for modification of the decree. If, for example, a substantial number of producers entered the market sooner than anticipated, the court might set aside certain portions of the injunctive relief. Conversely, if no entry was forthcoming, it might prolong the decree or take more drastic corrective steps, perhaps of a structural nature.<sup>205</sup>

203. Apparently, dual or multi-line retail automobile distribution is common in Europe where it is referred to as "the supermarket approach." *Hearings Before the Select Committee on Small Business on the Status and Future of Small Business*, 90th Cong., 1st Sess. at 431 (1967).

204. Turner has argued that extensive advertising by tight oligopolies create formidable barriers to entry and substantially increase concentration. He suggests that it would be quite appropriate to impose, for a limited time, absolute or percentage limitations on promotional expenditures of firms that have obtained undue market power through antitrust violations. Turner, *supra* note 159, at 93-96. See also p. 602 *supra*. A similar suggestion has been recently advanced by two antitrust economists. Asch & Marcus, *Returns to Scale on Advertising*, 15 ANTITRUST BULL. 33, 39-40 (1970). Mueller contends that government limitations of advertising expenditures by oligopolists would not raise first amendment problems. Mueller, *supra* note 2, at 89-90. Subsection (c) of the proposed Concentrated Industries Act of the White House Task Force on Antitrust Policy also suggests possible limitations on advertising expenditures. THE NEXT REPORT, *supra* note 11, at 66.

205. In *United States v. United Shoe Machinery Corp.*, 391 U.S. 244 (1968), the Supreme Court made it clear that an antitrust decree which has failed to accomplish its intended purpose of restoring effective competition may be modified to provide additional structural relief. The district court in the earlier *United States v. United Shoe Machinery Corp.*, case, 110 F. Supp. 295 (D. Mass., 1953), had rejected the government's request for divestiture. Following the Supreme Court's ruling that the initial decree was inadequate, the district court has recently entered a divestiture order. *United States v. United Shoe Machinery Corp.*, 1969 Trade Cas. 86,411 (D. Mass.).

Annual style change has been a characteristic of numerous other durable goods industries since the late 1940's. Significantly, concentration has increased more rapidly in this sector than in any other area of manufacturing. By 1966, style-changing industries exhibited the following 4-firm concentration ratios: home freezers—82%, typewriters—79%, washing machines—79%, vacuum cleaners—78%, refrigerators—72%, cameras—67%, computers—67%, and televisions—58%. *Hearings Before the Subcomm. on Antitrust and*

## Automobile Industry

If annual style change in the automobile industry is an unfair method of competition under Section 5 of the Federal Trade Commission Act, only the FTC can sue for relief.<sup>206</sup> This Note calls upon that agency to investigate and, if appropriate, to bring suit against this practice.

*Monopoly of the Senate Comm. on the Judiciary on Economic Concentration*, S. 89th Cong., 1st Sess., 1901-1905 (1965); U.S. DEPT. OF COMMERCE, ANNUAL SURVEY OF MANUFACTURERS: 1966, at ch. 11. In light of this Note's findings with respect to the automobile industry, an economic and legal investigation of annual restyling in these concentrated industries might also be in order. Significantly, the FTC is currently studying "style or nonfunctional" model changes in household appliances and other consumer products for evidence of "planned obsolescence." The Commission suggested that "the practice might run afoul of Federal antitrust laws as well as those against unfair or deceptive trade practices." N.Y. Times, March 28, 1971, at 40, col. 2.

206. The Federal Trade Commission has exclusive jurisdiction to enforce Section 5, 15 U.S.C. § 45 (1964). As a result, the Department of Justice cannot bring suit against alleged violations of that section. *Marquette Cement Mfg. Co. v. Federal Trade Commission*, 147 F.2d 589 (7th Cir. 1945), *rev'd on other grounds sub nom. Federal Trade Commission v. Cement Institute*, 333 U.S. 683 (1948). Apparently, private antitrust suits cannot be brought under Sections 4 (treble-damage actions) or 16 (injunctive relief) of the Clayton Act (15 U.S.C. §§ 15(a), 15(b), 26) for alleged violations of Section 5 of the Federal Trade Commission Act. See *Nashville Milk Co. v. Carnation Co.*, 355 U.S. 373, 376 (1958); *Atlanta Brick Co. v. O'Neal*, 44 F. Supp. 39 (E.D. Tex. 1942); *Rader v. Balfour*, 1968 Trade Cas. ¶ 72,709 (N.D. Ill. 1968). This does not prevent private parties, however, from calling upon the FTC to investigate and, if appropriate, to bring suit against the Big Three automobile manufacturers. See FEDERAL TRADE COMMISSION, PROCEDURES & RULES OF PRACTICE, 16 C.F.R. § 2.2: "Any individual . . . may request the Commission to institute an investigation in respect to any matter over which the Commission has jurisdiction" as long as the application sets forth "the alleged violation of law with such supporting information as is available . . . ."

# **AUTOMOTIVE BUMPER DESIGN IMPLICATIONS ON DAMAGEABILITY**

**Ford Motor Company  
Design Center**

**MAY 31, 1971**

## INTRODUCTION

The purpose of this report is to present to the U.S. Senate Commerce Committee pertinent facts relative to the impact of bumper design on automobile damageability as related to provisions of Senate Bill S. 976.

Specifically, this report will present additional and clarifying information on the design requirements, performance, and cost of an automobile bumper system capable of withstanding 5 MPH barrier or pendulum impacts without damage. The U.S. Senate Commerce Committee has received certain information and data on this subject, but, in our opinion, there are a number of points that need amplification.

At the outset, it should be made clear that we at Ford agree that significant improvement in the functional characteristics of modern automobile bumpers is required. In the last year and one-half there has been increasing concern among car owners with how easily their cars can be damaged, the high cost of repair, and rising cost of insurance. We share their concern because total cost of ownership is an important factor in customer satisfaction and subsequent car sales.

There is little question that the trend in recent years relative to bumper design has been toward more highly stylized configurations, integrated with the sheet metal and ornamentation. Widely varying styling workouts for various vehicles produced by the industry have resulted in bumpers which are not of uniform height, adding significantly to the damage problem in parking maneuvers.

## DEFINITION OF PROBLEM

About a year and one-half ago, Ford began seeking statistically valid data concerning the relative frequency with which individual car parts were damaged, and the speed at the point of impact that would cause the damage. The insurance companies, while complaining that there was a significant vehicle property damage problem in total, were unable to supply detailed data that would permit determining specifically the contribution of individual elements of vehicle design to damage levels. This information was needed in order to develop design changes that would reduce vehicle damage on a cost effective basis. To obtain these data, Ford undertook a detailed survey of nearly 20,000 vehicles that had been involved in accidents and were in body shops awaiting repair. This analysis was supplemented by duplication of the damage under test conditions where speed at the point of impact could be accurately measured. From this study, Ford reached the following conclusions:

1. 70% of all property damage accidents involved the front or rear of the vehicle. (40% involved front end, 30% involved rear ends.)
2. 60% of all front and rear end property damage accidents involved speeds at the point of impact equivalent to a 5 MPH barrier crash or less. 25% involved speeds of 2½ MPH or less — essentially parking encounters.
3. 60% of all front and rear end property damage accidents involved the corners of the vehicle, rather than being head-on (such as would be simulated with a barrier crash).

**Figure 1**

**Figure 2**

**Damage Done by Loaded Railroad Car Impacting Parked Car at 5 MPH**

## CORRECTIVE ACTION PROGRAM

It was clear that an improved bumper system could play a significant part in reducing vehicle damage and hence the cost of repair. At the time this conclusion was reached at Ford, the 1973 model design was under way and plans for an improved bumper system were undertaken on the Ford and Mercury as these car lines were scheduled for substantial changes in that year. It was contemplated that improved bumper systems would be adopted on other car lines in 1974, or as soon as major retooling of front and rear end components could be accommodated within cycle plans.

During the last year, there has been a great deal of publicity about the bumper problem and considerable regulatory action both at the State and National level. The issuance of the federal bumper standard by the DOT on April 16, 1971 required some modification of Ford's bumper plans to assure that we would be in a position to comply with the bumper standards on all 1973 and 1974 models (if the change proposed by Ford for 1974 is adopted).

## BARRIER TEST

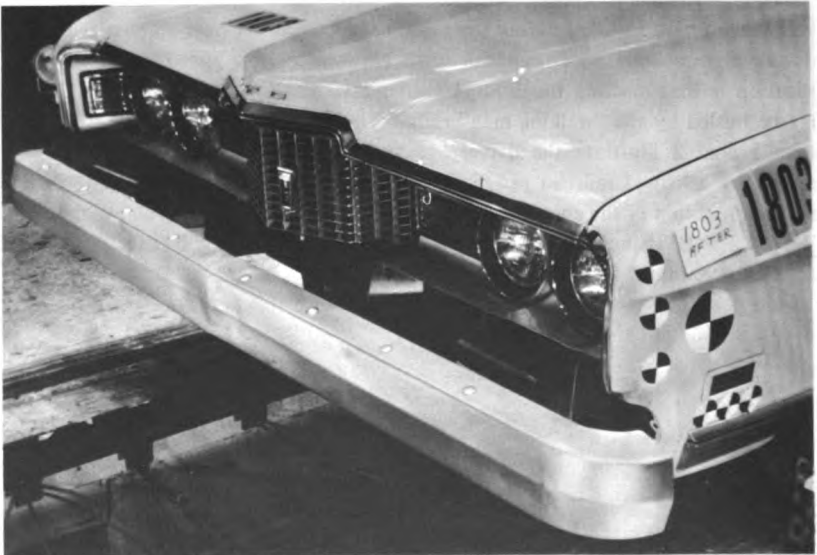

Before describing the specific components required to achieve a 5 MPH bumper system, we believe that some information relative to the barrier and pendulum test procedures would be helpful in putting the federal bumper standards in perspective.

Witnesses who have testified before the Commerce Committee have emphasized that a man can walk at a 5 MPH pace, and can impact a wall at this speed without injury. The implication is that meeting the 5 MPH barrier test with an automobile is "child's play." Don't be misled by the "walking man" simile. The mass of the object makes a difference. Figures 1, and 2 illustrate the damage to a parked automobile that will occur if it is impacted by a loaded railroad car moving at a walking pace — 5 MPH. The damage on impact is a function of the energy of impact which is a product of mass and velocity. ( $KE = \frac{1}{2} MV^2$ ). At a 5 MPH impact, a man generates 125 ft-lbs, a car 3,500 ft-lbs. and the loaded railroad car 190,000 ft-lbs.

**Figure 3**

**1971 Production Ford after 5 MPH Barrier Impact**

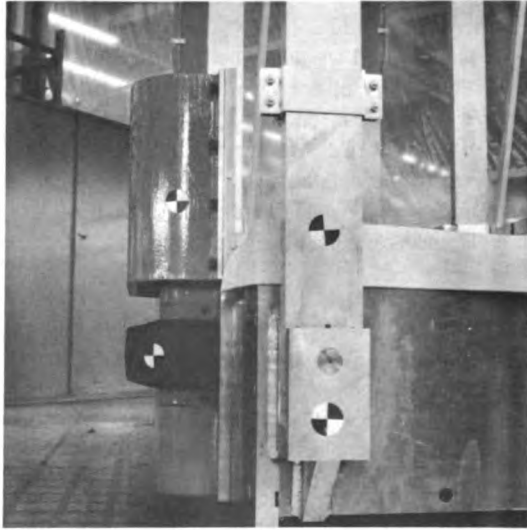

**Figure 4**

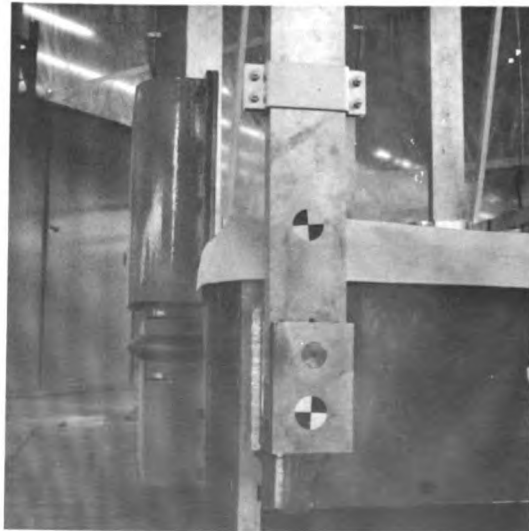

**1971 Ford with Energy Absorbing Bumper System after 5 MPH Barrier Impact**

Turning to the fixed barrier test for automobiles, figure 3 illustrates the damage done to the front end of a 1971 production Ford weighing about 4000 lbs. upon impact with a fixed barrier at 5 MPH. All of the energy of impact (nearly 3,500 ft-lbs) must be absorbed by deformation of the bumper and sheet metal. The damage is significant with bumper, hood, fenders and outer grille panels distorted. The results illustrated here are not significantly different than those reported to this committee by Dr. William Haddon, Jr. (In this test the center grille panel was undamaged, while the Insurance Institute for Highway Safety reported center grille replacement was necessary following the 5 MPH barrier test with a 1971 Ford Galaxie 500).

For comparison, figure 4 illustrates the lack of damage done following the same test procedure with a 1971 Ford equipped with the energy absorbing bumper system being developed for the 1973 model. Here the impact energy is absorbed by the bumper system and the car can withstand the 5 MPH barrier crash without significant damage.

**Figure 5**  
**Ford Proposed Pendulum Shape**

**Figure 6**  
**Pendulum Shape Specified by DOT**

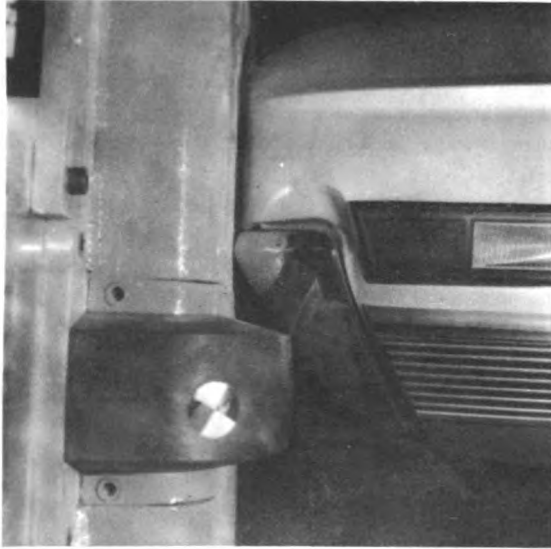

## PENDULUM TEST PROCEDURE

There has been some comment made relative to the requirements of the federal bumper standard which include the pendulum tests. Ford has endorsed the concept of the pendulum test because we believe it will assure a more effective bumper system for the consumer than a barrier test.

The pendulum test requirement will assure uniform bumper height and, therefore, correct the mismatch problem that is one of the most significant causes of low speed property damage. In addition, the pendulum test will establish bumper performance standards relative to corner impacts, a major part of the low speed collision damage problem.

With regard to the pendulum test procedure, I believe that a closer look at the pendulum configuration is in order to put the 1974 federal bumper standard in perspective. The weight-of-the-car pendulum is suspended from arms that allow it to swing into the car bumper. In conducting the test, the pendulum is pulled back far enough so that on a free swing after release it will be traveling at 5 MPH speed at the point of impact.

Figure 5 illustrates the side view of the pendulum, and demonstrates the shape of the impacting ridge — shown in black — that Ford has recommended to the DOT. This impacting ridge is blunter than that specified in the 1974 federal bumper standard (figure 6) and is more like another automobile bumper. In our opinion, the Ford impacting ridge shape will result in a fully effective bumper from a consumer standpoint.

**Figure 7**

**Minor Bumper Deformation Causes Test Failure**

**Contact constitutes failure (only the black ridge can touch)**

The 1974 standard specifies that it will impact both front and rear bumpers 8 times, 6 across the face and once on each corner ( $30^\circ$  angle). Only the impacting ridge (the black part of the pendulum) is allowed to contact the vehicle and if any part of the car (including the bumper) touches the vertical (or yellow) surface of the pendulum it constitutes a test failure. This requirement is really the controlling factor in the design of the bumper system, not the much publicized requirement that only safety related items (lights, fuel and exhaust system, hood and deck locks) function normally after the test.

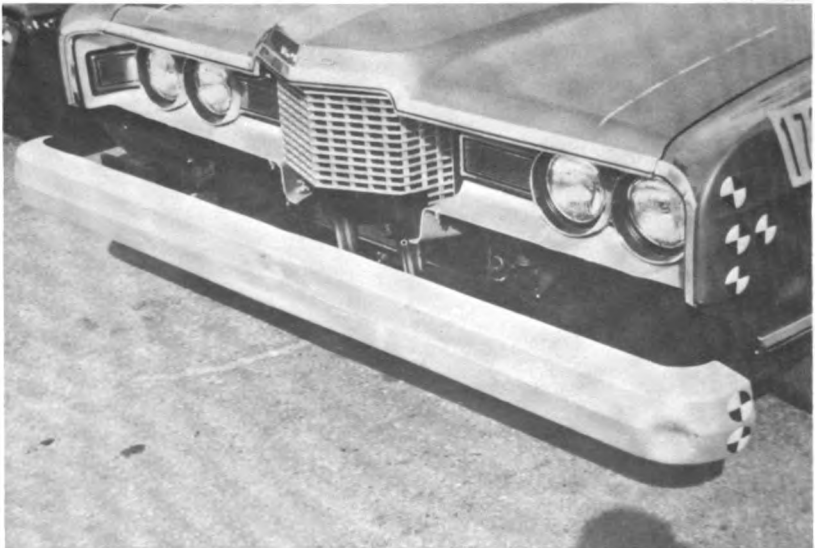

If there is any significant deformation of the bumper bar under the initial pendulum impacts, additional hits (up to a total of 8) will inevitably cause some part of the bumper or car to touch the vertical pendulum surface constituting a test failure. This type of situation is illustrated on figure 7. Here the pendulum impact from a prior hit has deformed the bumper enough so that on this hit, part of the bumper touches the vertical surface of the pendulum causing a test failure. In this example, the 1971 Ford bumper shape has been used. It is evident from this illustration that a bumper shape with a more vertical front face will be required to meet the federal standard.

For all practical purposes, the pendulum test requires a bumper design that will withstand repeated impacts without incurring any significant damage to the bumper or car components.

**Figure 8**

**1971 Production Ford after 5 MPH Pendulum Test – 8-Hits**

**Figure 9**

**Ford Energy Absorbing Bumper System after 5 MPH Pendulum Test – 8-Hits**

There has also been some confusion about the relative severity of a 5 MPH barrier test versus a 5 MPH weight-of-the-car pendulum test. In a barrier crash, all of the energy of the impact must be absorbed by the vehicle. Since the car is free to roll in the pendulum test, only part of the pendulum impact energy is absorbed by the car with the balance translated into movement of the car. The pendulum test has thus been criticized as providing a less severe test than a barrier impact at the same speed.

With the pendulum test, however, multiple hits are specified across the face of the bumper, and with an off-center hit, one energy absorbing strut must be capable of handling the full pendulum impact transmitted to the car without any assistance from the other energy absorber. The total system can, of course, handle higher impact load in the center because the load is divided between the two absorbers.

In total, a system that can withstand a 5 MPH weight-of-the-car off-center pendulum hit can also accommodate a 5 MPH barrier hit. The severity of the two tests are equal.

Figure 8 illustrates the results of the 5 MPH Ford pendulum test (after the specified 8 hits) with a 1971 production Ford. The damage is extensive; considerably more with the multiple pendulum hits than was experienced with the 5 MPH barrier crash. (See Figure 3).

Figure 9 illustrates the results of the same test procedure with the Ford energy absorbing bumper system. Only minor denting of the bumper bar was experienced. There was no basic damage to the car.

Taylor and Menasco Energy Absorbing Struts

## COMPONENT CHANGES — 5 MPH SYSTEM

Now let's take a look at the specific components that are required to make a 5 MPH bumper system work. Vehicle changes associated with the 5 MPH bumper system are related to (1) changes to accommodate the new components; (2) changes required because of increased impact loads imposed on the vehicle, and (3) modifications to accommodate the effect of added vehicle weight. The following specific changes are required on the full size Ford, but are typical of changes required on all car lines.

### Bumper Bar

Figure 10 illustrates the type of bumper bar being developed for the Ford energy absorbing system compared with the 1971 production bumper. Note the simple shape and heavy reinforcement of the prototype components. This heavy, boxed-in reinforcement design provides a much stronger impact bar, and when incorporated in the front and rear of the Ford car will add at least 80 lbs. over current production bumpers.

### Energy Absorbers

An energy absorbing bumper system requires that the bumper be mounted on some sort of shock absorbing device. There are three types of shock absorbing units under consideration for the Ford 5 MPH bumper system: (1) the energy absorbing strut; (2) a spring steel shock absorber, and (3) an elastomeric shock absorber. Each type will be described in more detail on the following pages. A pair of absorbers will be used to replace the 1971 bumper arms.

Shown in figure 11 are two examples of one approach to an energy absorbing system. One is designed by Taylor Devices, Inc., and the other by Menasco Manufacturing Corporation. Both absorb impact energy by forcing fluid through an orifice, similar to a conventional car shock absorber. These struts stroke about 3-1/2" under a 5 MPH impact. The Taylor design uses a liquid silicone fluid, while the Menasco strut uses a silicone which is solid at normal temperatures and pressures, but behaves as a liquid under impact loads.

**Figure 12**

**Ford Experimental Safety Vehicle after 50 MPH Barrier Crash**

Both the Taylor and Menasco struts can be designed to accommodate higher speed impacts with more stroke. In fact, a special set of Taylor struts were incorporated in a Ford experimental safety car that was subjected to a 50 MPH barrier crash. Mr. Taylor testified before this committee that these struts had withstood repeated 50 MPH impacts without damage to the struts and only minor damage to the car. It is true, the struts were not damaged in the 50 MPH crash test, but as shown in figure 12, the car was a total loss.

This crash test was one of the early evaluations of the ability of a unique vehicle structural design to be able to withstand a 50 MPH barrier crash while retaining the integrity of the passenger compartment. This portion of the test was successful with the windshield retained and doors remaining closed.

Passenger restraint systems used in this test proved inadequate, however, and recorded head accelerations of the "occupants" exceeded values which are generally considered to be the limits of human survivability. These problems are believed solvable with further design development.

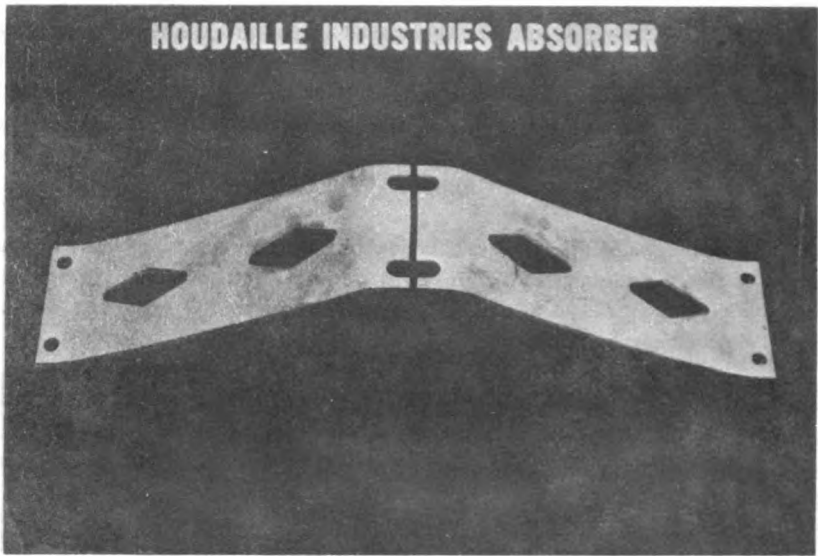

Figure 13

Houdaille Spring Steel Shock Absorber Device

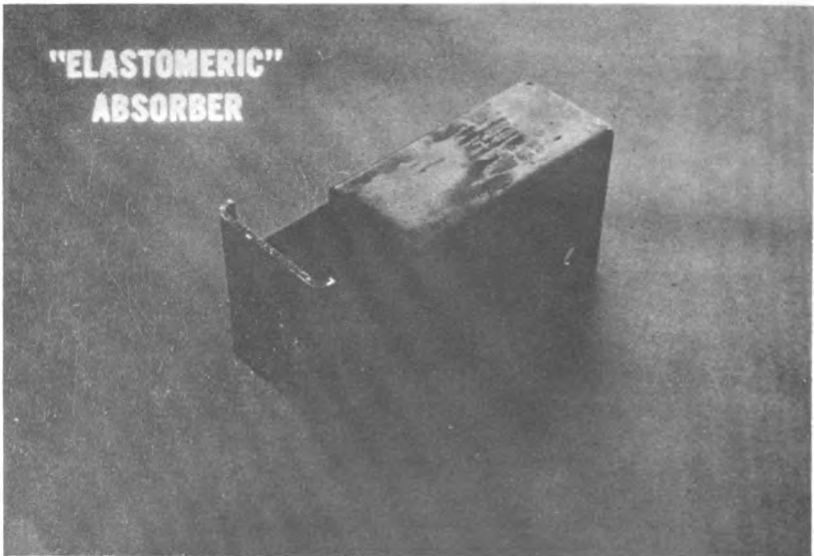

Figure 14

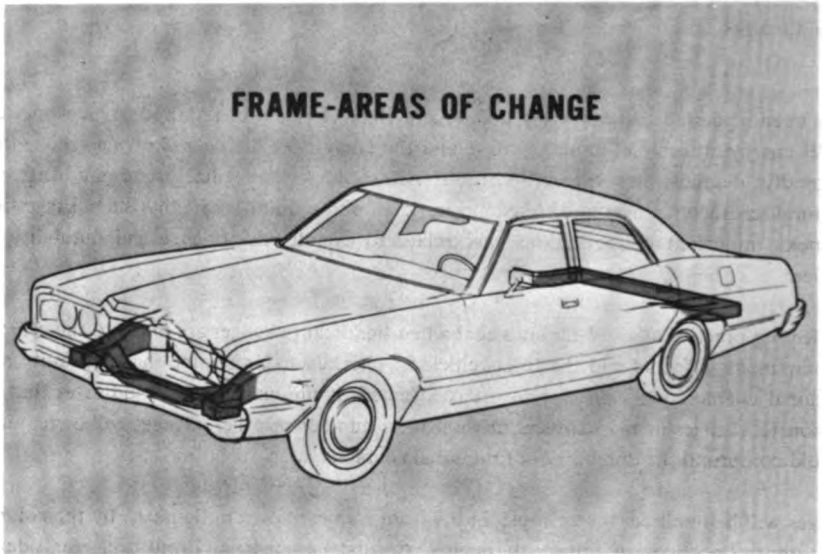

Elastometric Shock Absorber Device

Another approach to a shock absorber system is the spring steel hanger arrangement (figure 13). Technically, this is not an energy absorption device, but rather an energy storage system. This spring acts as a column that yields under impact load resulting in rather large deflection (3" to 4" at 5 MPH).

A third type of absorber is an elastomer system (figure 14) using rubber pucks moulded with steel inserts that function under load similar to an engine mount. Their load-deflection curve is essentially linear. This is a form of spring, and does not absorb energy. Similar devices have been used as railroad and ship bumpers for many years.

Each of the three energy management approaches perform the same shock absorbing function in the bumper system. The Taylor and Menasco struts absorb energy and, therefore, minimize, for a given deflection, the loads transmitted to the vehicle. The spring steel and the elastomeric devices store, rather than absorb energy and, therefore, transmit higher loading to the vehicle than an energy absorbing unit for the same deflection. This would tend to limit the impact speed for which a spring type device would be usable. At 5 MPH impacts, however, either an energy absorber or a shock absorber will function satisfactorily with both types reducing the loads transmitted to the occupant below those experienced with current production bumper systems under 5 MPH barrier impacts. These performance differences, as well as other factors such as durability, reliability and cost, are being evaluated by Ford to permit a final selection of the absorber to be used in the 1973 bumper system.

All of the absorbers require substantial brackets to provide secure attachment to the frame and bumper bar. Conventional bumper arms are, of course, deleted. The net increase in vehicle weight for four absorber units, two front and two rear with attaching brackets is about 20 lbs. over the conventional bumper hanger arrangements.

**Figure 15**

**Ford Car Frame Changes Required for 5 MPH Bumper System**

## Frame Changes

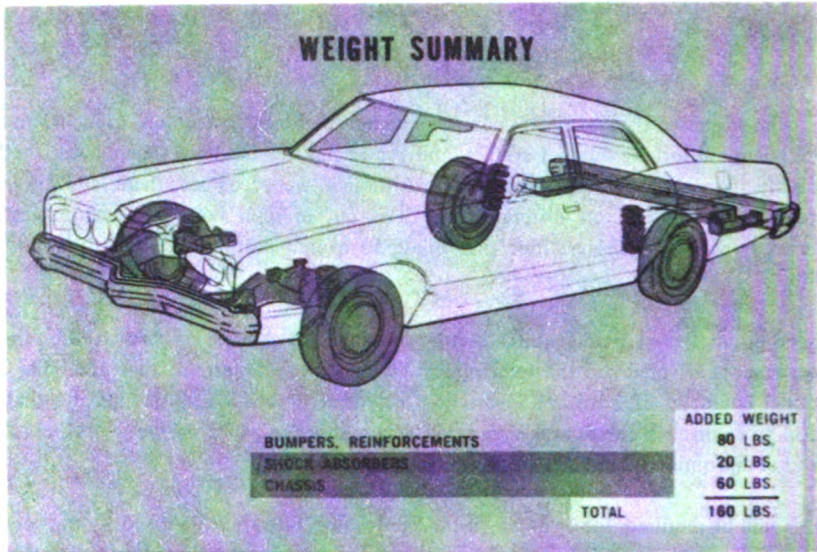

It has been suggested that no chassis component changes would be required to incorporate a 5 MPH energy absorbing bumper system, and the committee has been shown a vehicle that supposedly demonstrates this proposition. Although we recognize there are different structural characteristics on different cars, it is our opinion that any such suggestion overlooks important considerations that relate to overall performance and durability of vehicles.

Engineering practice at Ford requires that when significant changes are made to the vehicle, all components affected and the total vehicle be checked to determine that durability and functional characteristics are not adversely affected. Preliminary analysis indicates that, in addition to changes in the bumpers themselves, a number of other changes will be required to avoid compromising durability or functional characteristics.

Changes will be required, for example, in the Ford frame. Shown in figure 15 by the colored areas are the portions of the Ford frame that must be changed. Front and rear siderail configuration changes are necessary in order to accommodate mounting of the energy absorbing devices. In addition, the higher impact forces necessitate gauge increases and fully boxed section on the rear cross member as well as extension of the inner rear siderails.

The front end of the current Ford frame is of an "S" design, specifically constructed to efficiently absorb crush forces in a high speed crash. This design makes it necessary that the frame be modified to accommodate the requirements imposed by a 5 MPH bumper system.

The changes to adapt the frame to the new bumper system, and to strengthen the frame for higher impact loads will add about 25 lbs. to vehicle weight.

**Figure 16**

**Added Vehicle Weight with 5 MPH Bumper System (Typical Full Size Ford)**

### Other Chassis Changes

Other chassis structures, as in the case of frames, must be designed not only to withstand the anticipated maximum loading to which they may be subjected in severe service, but must have the durability characteristics to withstand the cumulative effect of such loads over the full life of the car. It is possible that impact loads from a 5 MPH bumper system could be carried without visibly distorting an unreinforced frame. However, the cumulative effect of bumper impact loads into the structure combined with the effect of continuing dynamic load encountered in vehicle operation could result in permanent deformation of the frame which could adversely affect front end alignment (resulting in tire wear and handling problems) and vehicle durability.

Changes to many other chassis components besides the frame are also essential to accommodate a 5 MPH energy absorbing bumper system and at the same time maintain current product performance capabilities. These include modified suspension springs for a heavier vehicle, revised engine mounts (addition of fore and aft restrictors) to withstand impact loading, and modified power steering for heavier loads. The increase in vehicle weight associated with these chassis changes which are required on the Ford car (exclusive of the frame) is 35 lbs. over the current production model.

To meet the federal and Ford standards on tire loading with the total added vehicle weight described above requires increasing tire size on most Ford body styles. Finally, the added vehicle weight necessitates brake modifications to assure that we do not deteriorate vehicle stopping ability with the heavier car.

### VEHICLE WEIGHT INCREASE

In total, chassis changes constitute a significant part of the task in adopting an energy absorbing bumper system to the Ford car. The design implications of these components are complex and interrelated, and not easily understood by someone not associated with the engineering details of performance and durability of the automobile. As summarized, figure 16 chassis component changes will add about 60 lbs. to the weight of the typical Ford car model, while the 5 MPH bumper and absorber system itself will add about 100 lbs. for a total weight increase of about 160 lbs.

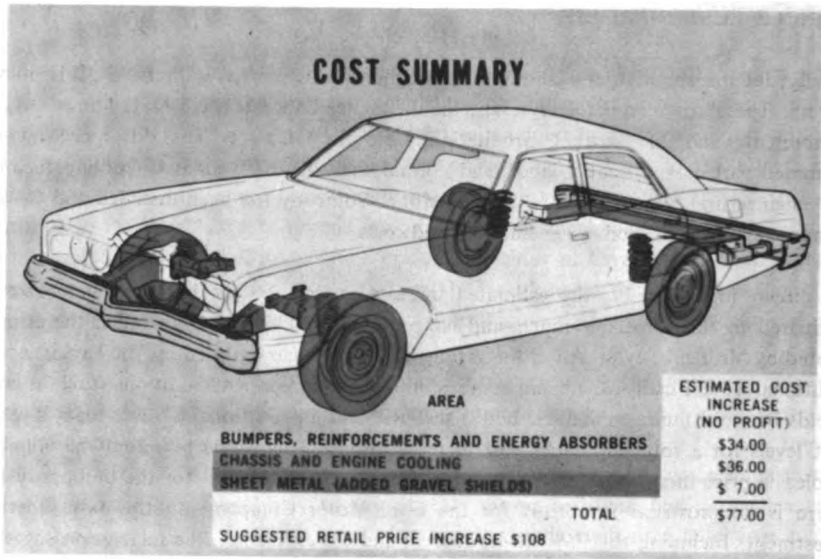

Figure 17

Cost Increase with 5 MPH Bumper System (Typical Full Size Ford)

## VEHICLE COST INCREASE

Finally, let me speak briefly about the cost increase associated with the 5 MPH bumper system. These cost estimates represent the difference between the 5 MPH bumper system components and the current production parts they replace. The difference includes estimated part cost, assembly labor, and normal write-off of fixed costs (tooling, facilities, and engineering). No profit to the Ford Motor Company has been included and the cost data include no allocation of general overhead costs.

As shown in figure 17, the estimated increase in cost of the bumpers and absorbers compared to the current bumpers and hangers is \$34. This closely parallels the estimate quoted by Mr. Paul Taylor. All of the various chassis changes (ignored by Mr. Taylor) add an additional \$36. Finally, there are some minor body component additions (such as gravel shields between bumpers and the body) that will add an additional \$7 over today's vehicle cost levels for a total estimated cost increase of \$77. This would represent the minimum wholesale price increase of the Ford car to recover the added cost for the bumper system. There is no provision for profit for the Ford Motor Company on the extra cost and investment. Including the 25% dealer margin and 7% excise tax, the increase in suggested retail price would be \$108 for the 5 MPH bumper system.

In this presentation, we have described the product changes and the cost effect of adopting a 5 MPH bumper system on the full-size Ford. Changes required on other Ford Motor Company car lines, ranging from the Pinto to the Lincoln Continental will vary in specific detail, but are expected to result in the same order of magnitude of weight and cost increase. The Ford car is believed typical of the average.

**SUMMARY**

In conclusion, summarizing the major points made in this presentation:

1. Bumper design in recent years has emphasized appearance at the expense of function. Improvements in bumper function are required to reduce low speed accident damage, and significant changes will be made starting with the 1973 model.
2. We support the federal bumper standard for 1973 and 1974 with the revisions proposed by Ford, and believe that with the 1974 model this standard will assure an essentially damage-free vehicle under the 5 MPH test conditions.
3. A 5 MPH bumper system applied to the front and rear of the Ford car will increase the weight of that vehicle by over 160 lbs., and increase the retail price to the consumer by \$108, with no increase in profit for the Ford Motor Company.

We are hopeful that the information presented in this report has contributed to a better understanding of the bumper situation, and has increased the committee's level of confidence that bumper systems that comply with the 1974 federal bumper standard will achieve fully the level of bumper performance being sought in S.976.

The Ford Motor Company appreciates the opportunity to present this additional information on bumpers relative to Senate Bill S.976.

## SUPPLEMENTARY STATEMENT OF THE FORD MOTOR COMPANY

The purpose of this statement is to supplement Ford's testimony of May 10, 1971, before the Senate Commerce Committee on S. 976, the proposed Motor Vehicle Information and Cost Savings Act.

Our objectives in submitting this supplementary statement are three-fold. First, we hope to clear up some of the misunderstanding that we feel has developed -- partly as the result of apparently conflicting testimony -- on the subject of bumper systems.

Our second and most important objective is to re-emphasize our principal concerns over major aspects of the proposed legislation that we believe may have been obscured by the attention that has been given to the relatively narrow subject of automotive bumper performance. In this connection, we shall offer suggestions for changes in the bill that we believe will contribute to the achievement of its basic goals.

Finally, we are submitting Ford's comments on two proposed amendments to S. 976, as promised during our May 10 testimony.

Bumper standards form but one aspect of the comprehensive proposal before the Committee. In fact, inclusion of a bumper standard in this legislation appears unnecessary and undesirable. It is unnecessary in view of the fact that, since the introduction of the bill, the safety specialists in the Department of Transportation have promulgated a standard for bumpers which, with amendments we have suggested, would be more rigorous than the statutory standard proposed in S. 976. We think the statutory provision is undesirable because it mandates both the level of the standard and the test to be utilized; i.e., a barrier test. If the bumper standard remains in S. 976, the result would be a barrier test for 1973; a barrier test plus an added pendulum test for 1974, and then, by statutory mandate, a barrier test only for 1975. It would be difficult to square such a result with good regulatory procedure.

In addition to this observation on bumper standards, we are including with this statement as Attachment A a report on bumper systems and standards which seeks to clarify the questions which have been raised on this subject during the Committee's hearings.

We turn now to some of the other major aspects of the proposed legislation. Currently, S. 976 is drafted as an amendment to the National Traffic and Motor Vehicle Safety Act of 1966 -- an act intended and designed to achieve life-saving goals of highest national priority. S. 976, on the other hand, is intended to save money, not lives, and this goal clearly should have a lower priority. In our judgment, this difference suggests two important reasons why any new legislation on vehicle damageability should be drafted to stand alone on its own merits and should be entirely separate from the Safety Act.

The first reason is that the assignment of a new set of functions to the National Highway and Traffic Safety Administration of the Department of Transportation would dilute the resources being devoted to the objectives of both the Motor Vehicle Safety Act and the Highway Safety Act, it would seem especially unwise to propose expansion of its responsibilities to include lower-priority purposes.

Our second reason for advising against passage of S. 976 as an amendment to the Safety Act is that the intermingling of safety and damageability provisions in a single act would tend to becloud the meaning of both sets of provisions for manufacturers and regulators alike. The inclusion of damageability provisions in the Safety Act would give them equal importance with the safety provisions of the act and it would be difficult to determine which should legally prevail in case of conflict between them. These are problems that cannot necessarily be solved by more careful drafting of the bill. It would be easier to assure that safety considerations will prevail over damageability considerations if these two goals are dealt with in separate legislation. In any event, however, it is essential that damageability legislation include language which makes it clear that vehicle safety will prevail whenever there is a conflict.

In our testimony of May 10, we endorsed several provisions of S. 976, with suggested changes intended to make these provisions more effective in serving the broad purposes of the bill. With the changes we have suggested, we support the proposal to require a study of the feasibility of determining comparative risk of personal injury in different models of cars. We also support, with certain recommended changes, the provisions regarding vehicle safety inspection and uniform certificates of title.

Our principal concern is with the provisions of S. 976 that would authorize the establishment of standards to reduce vehicle damage and to facilitate inspection and repair. We do not see how these standards would result in the cost savings to consumers that are referred to in the title of the bill. As we stated in our May 10 testimony, we believe that the standards authorized by the bill -- along with associated testing and reporting requirements -- could add substantially to the price of new cars. The consumer will benefit only if the savings he realizes through reductions in insurance premiums and out-of-pocket costs are greater than the increase in new car prices.

The legislation before the Committee fails to assure insurance premium reductions. Indeed, the most it calls for in this connection is a report to Congress on the actions -- or lack of actions -- by the insurance industry. The bill also fails to require that any standards established under its authority be based on a finding that the resulting savings to consumers -- in the form of lower insurance and repair costs -- will be greater than the resulting costs to consumers in the form of higher new car prices. As far as we know, there has been no discussion before the Committee of the possible nature of repairability and damageability standards other than bumper standards. Nor has there been any consideration of the possible savings and costs resulting from such standards.

We believe that a better way to achieve the goal of reducing consumer costs, as we suggested on May 10, would be to strengthen the consumer information provisions of S. 976. Ford would support legislation requiring the Secretary of Transportation to undertake a study of the feasibility of developing methods designed to allow a determination and comparison of the susceptibility to damage of passenger motor vehicles involved in traffic accidents. Under this recommendation, the Secretary would be pursuing the problem of vehicle damageability in the same manner as the bill proposes that he tackle the question of comparative risk of personal injury or death to vehicle occupants.

Upon satisfying himself of the feasibility of such methods, the Secretary would then be in a position to obtain and make available to consumers information they otherwise would not have -- information that would enable them to choose among different makes and models on the basis of susceptibility to damage and costs of insurance.

If differences in susceptibility to damage result in insurance rate adjustments -- and this is a very important "if" -- the consumer who wishes to reduce his insurance and probable accident repair costs will be able to do so. In addition, this

approach would preserve what many of you have called for, namely, competition among the manufacturers in the design of cars that appeal to cost-conscious consumers. If, in fact, many consumers will be drawn to those makes and models which offer maximum savings in insurance and accident repair costs, the manufacturers will be forced to compete vigorously with each other on the basis of minimizing the damageability of their products.

In order to establish procedures to allow valid comparisons, the Secretary must find some way to assure that vehicle differences are reflected in insurance premium differences, and that both kinds of differences are reflected in the comparative data to be made available to consumers.

It seems clear to us that the present provisions of the bill with respect to insurance premiums are entirely inadequate to achieve this result. The bill places no obligation on the insurance companies to adjust premiums to reflect vehicle differences, and it places no obligation on the Secretary other than providing information to the insurers and observing and reporting the extent to which they make use of that information.

In our judgment, this is a basic flaw which must be remedied before there is any chance that the bill will have its desired results.

Devising a procedure to determine comparative damageability will not be an easy task. The procedure should, of course, correlate closely to the real world, and the real world involves a multiplicity of accident situations including impacts between different makes and models at various speeds and various car locations, as well as impacts between vehicles and other objects.

The procedure must recognize this complexity. It must be accurate both in order to save money for consumers and because it could have a major impact on the sales of the various manufacturers. At the same time, however, if the method itself is unduly complex and costly, it will defeat the basic goal of cost reduction.

In our opinion, a good method -- which combines accuracy with efficiency -- need not necessarily be confined to "tests and test procedures" but could include analysis based, for example, on computer models. We, therefore, suggest that the Secretary be authorized to establish "methods" rather than "a system of tests and test procedures".

The requirement that production versions of each make and model be tested at several different speeds is unnecessary and would be unduly costly and burdensome. The testing burden would be especially heavy because it would have to be completed within a few weeks after the start of new model production in order to have the information available to consumers when the new models go on sale. As we suggested on May 10, we believe that the industry should be permitted to use the same reporting procedures, with respect to damageability, that it is now permitted to use in reporting consumer information under the regulations issued by the Safety Administration.

Subject to appropriate regulatory criteria and procedures, the Secretary should be empowered to specify the information he needs. The manufacturers should be free to decide how to develop that information, whether through crash tests of production cars or of prototype models or through engineering analysis or in some other way. The information reported by the manufacturers would, of course, be subject to verification by the government.

Any manufacturer who furnished false information would be vulnerable to penalties of law as well as to public censure. The manufacturers would therefore be under pressure to report information that would conservatively represent the performance of all their production vehicles. Such information would be more reliable and more useful to consumers than the precise results of tests of a limited number of vehicles.

This concludes our comments on the major provisions of S. 976. During our May 10 testimony before the Committee, we promised to provide certain additional information, including Ford's comments on several proposed amendments to S. 976. Attachments B and C to this statement present Ford's position on the proposed amendments dealing with odometers and with vehicle emissions testing.

The additional information we promised to provide on May 10 on the relationship between automobile retail and whole-sale prices as established by the Bureau of Labor Statistics and on the number of Ford engineering personnel working on vehicle safety is now being developed and will be filed with the Committee very shortly.

COMMENTS OF FORD MOTOR COMPANY  
ON AMENDMENT NO. 68 TO S. 976 CONCERNING ODOMETERS

OBJECTIVE

The purpose of this paper is to state Ford Motor Company's position with respect to the amendment to Bill S. 976 that would prohibit the disconnecting or turning back of odometers with the intent to defraud purchasers of motor vehicles.

DISCUSSION

Ford Motor Company supports legislation that would prohibit altering odometer readings with the intent of defrauding the public. We believe that a uniform procedure throughout the United States would be in the best interest of all. Ford believes, however, that it would be more appropriate to enact odometer legislation as a separate entity rather than as an addition to the National Traffic and Motor Vehicle Safety Act of 1966.

Ford Motor Company seeks to prevent odometer rollbacks and warranty coverage is voided if the readings are altered so that true mileage cannot be ascertained. In addition, the Ford Warranty and Policy Manual directs dealers, when replacing speedometer heads, to set the new head to indicate the mileage recorded on the old head at the time of replacement.

Accurate odometer mileage is necessary to permit proper periodic and preventative maintenance in areas such as oil changes, emission system checks and parts replacement, oil filter and air filter replacement, tune-ups and other routine maintenance. In addition, incorrect car mileage may seriously mislead or misrepresent the value of a used car in negotiating a proper price.

In the past few years, progress has been made with tamper-resistant odometers with the adoption of non-reversing shafts, die marking of odometer rolls, roll separator indicators, and rearrangement of components to deter tampering. In spite of these improvements, however, attempts at odometer rollbacks continue.

Ford supports the various sections in the proposed legislation with clarification, and/or modifications to Sections 604 and 608. With respect to Section 604 that covers the actual

disconnect, reset or alteration of odometers, a number of vehicles are driven for quality audit purposes at the assembly plant prior to shipment to the dealer. These vehicles generally do not have an odometer in operation. The mileage normally accumulated is minimal and generally a separate speedometer indicating device and possibly other instrumentation is attached. We believe that the proposed legislation is not intended to reach such practices that are related to improved customer and dealer satisfaction. To remove possible ambiguity as to its meaning, the phrase "After completion of assembly of the vehicle, including ancillary tests by the manufacturer, it shall be unlawful ..." should be added to Section 604. This would have the effect of clarifying the applicability of provisions of Sections 605 and 608 with regard to the obligations of the manufacturer. Further, insistence on having the odometer connected during the conduct of quality audit tests could create a question as to the expiration of the warranty period.

In the absence of such clarification, Ford believes that Section 608 as presently written would be objectionable to manufacturers for it requires a manufacturer of new motor vehicles to supply a form to the dealer indicating mileage recorded. Most new vehicles leaving the assembly facility have little or no mileage recorded on the odometer. It would seem to us that the benefits and/or protection to the consumer would not justify the added cost to prepare documents prior to the first retail sale of a new vehicle. We recommend that recording of mileage be made at the time of retail sale between the dealer and the buyer.

Ford strongly urges that federal legislation on the control of odometers preempt state laws to the extent that those laws are inconsistent with the provisions of the final federal legislation. Although many states have passed odometer laws, some of this legislation is not consistent between states and we believe that uniformity is necessary throughout the country in order that manufacturers may continue to work toward optimum tamper-resistant systems.

#### RECOMMENDATION

The Ford Motor Company is in accord with the aims and objectives of the proposed odometer legislation and fully supports federal legislation in this area. We recommend, however, that final legislation provide the manufacturer with the flexibility to selectively test-drive vehicles at assembly plants without violation and that it is unnecessary to require that manufacturers supply a document indicating actual mileage of new vehicles. Instead, this could be accomplished by recording the mileage when the car is delivered by the dealer.

Further, it is the view of Ford that the end sought to be achieved by the proposed odometer legislation would be best served if it stood as separate legislation and with enforcement possibly under the Federal Trade Commission rather than as an addition to the National Traffic and Motor Vehicle Safety Act of 1966. The Federal Trade Commission is, of course, the federal agency which is primarily charged with the responsibility of preventing fraud on the consumers -- the purpose of the proposed legislation.

COMMENTS OF FORD MOTOR COMPANY  
ON AMENDMENT TO S. 976 CONCERNING THE  
INSPECTION OF VEHICLE EXHAUST  
EMISSION CONTROL SYSTEMS

As amended, S. 976 provides for mandatory inspection of exhaust emission control systems at specified intervals.

We regard this amendment as both unnecessary and undesirable; unnecessary because, by the Clean Air Amendments of 1970, Congress vested similar authority in the Administrator of the Environmental Protection Agency, and undesirable because it would diffuse authority and, as a result, undercut the centralization principle inherent in Reorganization Plan No. 3 of 1970.

Discussion

Title II of the Clean Air Act deals with emissions from moving sources on a comprehensive and exclusive basis. The obligations of vehicle manufacturers are spelled-out at each stage of the process; s.g., research and development (Section 202(b)), prototype testing (Section 206(a)(1)), production (Sections 206(a)(2) and 207(a)), and vehicles in actual use over their useful life (Section 207(b)). The amendment at page 15 of S.976 represents an unnecessary and undesirable departure from the plan followed by Congress since 1965 of dealing with the vehicular emissions problem on a unified and comprehensive basis in a single law.

As amended by PL 91-604, the Clean Air Act requires the Administrator of the Environmental Protection Agency to prescribe an emissions performance warranty at such time as he determines, among other things, that "inspection facilities or equipment are available" (Section 207(b)). As a matter of policy, Ford Motor Company has consistently supported periodic maintenance of engines and emission control systems. The recent amendments of the Clean Air Act create, for the first time, an incentive for owners to maintain the emission control systems with which their cars are equipped. If additional legislation is required to implement the objective of the amendment at page 15 of S. 976, we respectfully submit that it should take the form of an amendment to the Clean Air Act.

Consistent with Congress' method of dealing with the problem, the Environmental Protection Agency recently was created and vested with broad authority to deal with a wide range of air pollution problems. To the extent that the amendment at page 15 of S. 976 would inject another Executive Department into the picture, it would have the undesirable effect of eroding the principle of centralizing authority and responsibility in the hands of a single agency.

Recommendation

In light of the unnecessary and undesirable consequences described above, we recommend that the proposed amendments to page 15 of S. 976 not be approved.

# AUTOMOBILE INSURANCE REFORM AND COST SAVINGS

TUESDAY, MAY 11, 1971

U.S. SENATE,  
COMMITTEE ON COMMERCE,  
*Washington, D.C.*

The committee met, pursuant to recess, at 10 a.m. in room 5110, New Senate Office Building, Hon. Frank E. Moss presiding.

Present: Senators Hart and Moss.

Senator Moss. The subcommittee will come to order.

We continue our hearings today on the several bills that are before the subcommittee, and we have some very outstanding witnesses to hear today.

Our first witness will be Mr. Robert Pitofsky, Director of the Bureau of Consumer Protection of the Federal Trade Commission.

I would ask Mr. Pitofsky to come forward and sit at the table and to identify the gentlemen who accompany you and proceed.

**STATEMENT OF ROBERT PITOFSKY, DIRECTOR, BUREAU OF CONSUMER PROTECTION, FEDERAL TRADE COMMISSION, WASHINGTON, D.C.; ACCOMPANIED BY JOSEPH MARTIN, JR., GENERAL COUNSEL; AND MORTON NEEDLEMAN, ASSISTANT TO THE BUREAU DIRECTOR**

Mr. PITOFSKY. Thank you, Senator.

I am accompanied today by Joseph Martin, Jr., the General Counsel of the Federal Trade Commission, and Morton Needelman, Assistant to the Bureau Director in the Bureau of Consumer Protection.

Mr. Chairman, in response to your invitation, I am pleased to testify before you on S. 976, the Motor Vehicle Information and Cost Savings Act.

This bill would permit the Department of Transportation to set property loss reduction standards, and establish the machinery for the creation of a nationwide system of diagnostic centers to inspect for manufacturing faults and inadequate repairs. The Commission endorses the objectives of the bill.

At this point, I would like to read into the record the Commission's statement on this. Let me note, however, that the statement has been submitted to the Office of Management and Budget but there has been no time to receive comment from them on the statement.

This is in response to your request of March 8, 1971, for the Commission's comments on S. 976, 92d Congress, 1st Session, a bill "To amend the National Traffic and Motor Vehicle Safety Act of 1966 in order to promote competition among motor vehicle manufacturers in the design and production of safe motor vehicles having greater resistance to damage, and for other purposes."

(1399)

The purpose of this bill is to establish the mechanisms for stimulating automotive design changes which will reduce the cost of normal collisions. The bill directs the Secretary of Transportation to develop tests for the susceptibility of automobiles to damage by collisions; to establish property loss standards; and to require energy absorbing bumpers which will withstand 5-10-15 mph collisions. The Secretary must publish the information gained from the tests and disclose his findings to insurance companies. Manufacturers, besides testing their vehicles and complying with the standards, must distribute to prospective purchasers information about their automobiles, including the collision withstanding capabilities and insurance costs. The bill also provides for cooperation with state and local governments and for the inspection of automobiles by independent inspectors prior to sale.

The Commission supports this regulation which could be an important first step in producing better designed cars which will reduce economic loss from accidents. This loss is a significant problem for consumers. Constantly inflating insurance costs alone are enough to suggest a thorough examination of methods to reduce the cost of normal collisions. Since there appears to be some evidence that design changes will go a long way towards remedying the situations, it seems imperative that the Federal Government assume responsibility for stimulating these design changes.

The agency entrusted with the Government's responsibility is the Department of Transportation. It is vested with the authority to study methods which might contribute to loss reductions. By publishing these studies and establishing standards based on them, it will use both competitive and regulatory pressures to encourage necessary changes. The Commission believes that responsibility under this bill is properly placed. The Department of Transportation is developing an increasing expertise in the regulation of the automobile industry.

The Commission endorses the objectives of the bill and considers it a potential boon to automotive customers, but it believes that the suitability of any particular legislative proposal should be considered by the Secretary of Transportation. Thus, the Commission suggests that the specific comments of the Secretary will be of greatest assistance in the deliberation of this bill.

That ends the Commission's statement on this matter.

Today, speaking as a member of the Commission's staff but emphatically not for the Commission, I propose to outline briefly my views on why legislation of this kind is needed to meet the severe consumer problems of mounting repair costs and defective cars.

At the outset, let me note that while the staff of the FTC does not have engineering expertise, we are aware of consumer needs in this area. Since at least the early 1960's when the FTC's warranty investigation began, the staff has continuously monitored consumer complaints about cars. Presently, we receive about 250 complaints a month indicating consumer dissatisfaction over defective new cars, unsatisfactory warranty performance, or poor repair work. In addition, our computer printout of complaints received by major law enforcement agencies in six major urban areas indicate that the problem of defective cars continues to be an overriding concern to consumers.

The Commission's 1970 Automobile Warranty Report and the proposals it contained largely reflected what the staff has learned about the growing sense of consumer helplessness and frustration over poor auto performance. At the conclusion of the warranty report the Commission recommended an Automobile Quality Control Act which would create a statutory obligation for manufacturers to design and build cars which, in all respects, would meet minimum standards of quality. In making this legislative recommendation, the Commission concluded that neither the competitive structure of the automobile industry nor the limited real bargaining power of consumers were likely to produce warranties which meet the problem of defects in new cars.

By the same token, it is my view that the regulatory and competitive

pressures contemplated by S. 976 can help to reduce the risk of economic loss. We cannot rely on industry alone to generate these improvements for as several students of the automobile industry have observed, by often engaging in frivolous year-to-year styling competition, the manufacturers may be largely responsible for creating these risks in the first place.

As for the argument that consumers may not be willing to pay the added costs which allegedly arise from design changes required under these standards, this assumes that rationally designed parts are more expensive than those now imposed on the public. I have seen no evidence that this is true. Moreover, even if the argument were valid, it overlooks the fact that consumers may be perfectly willing to pay a moderate increase in price for preventive engineering at the manufacturing level rather than subject themselves to the risk of enormous post-collision costs and increased insurance premiums.

As it happens, the plight of the consumer who is faced with post-collision bills is compounded by the fact that the cost of repairs depends upon the effectiveness of competition in the multistage system under which crash parts are now sold.

The Commission is deeply concerned about the alleged serious imperfections in competition in both the manufacturing and distribution of crash parts and how these imperfections may have contributed to the annual bill of billions of dollars for crash-related repairs.

As former Chairman Weinberger indicated in last year's Senate hearings, the staff of the Commission is now investigating the extent to which restrictive practices have eliminated competition at the manufacturing level as well as competition between independent body shops and franchised dealers.

Given these facts—an imperfect competitive climate, ever increasing costs, and an increase in consumer dissatisfaction—I believe it is essential that Congress legislate in this area.

As for the bill itself, I endorse the basic concept of a uniform Federal bumper standard. It is not feasible to impose varying and perhaps conflicting State standards on the auto industry. However, since some States may take the lead in proposing effective bumper legislation, it would be a substantial setback if the Federal law were so written to allow a permissive standard which could result in less consumer protection than would be available under effective State statutes.

While I do not profess to have any engineering expertise, I am impressed by a respectable body of expert opinion that holds that the standard set out in section 125(c) of the bill, that is, 5-mile collision by 1975 with minimum prescribed damage as determined by the Secretary, may be within current design capability, or, in any event, will be outdated by 1975. Whether this is true or not, as a matter of policy, I would not attempt to predict the state of the art in the future by adopting a specific standard.

I recommend, instead, that the bill contain a mandate for the Secretary to write bumper standards but that no specific standard should be set: there is always the danger that such a standard can become the maximum with the result that technology will be frozen with no incentive to advance. It seems to me that the public interest is best served by leaving the specific standard and effective date open, leaving it to industry, insurance companies, and consumer advocates to present their

most persuasive technical arguments to the Secretary about costs and engineering capability.

I also support the concept found in the bill of establishing tests and then subsequently rating and publishing reliable comparative data on the relative susceptibility of each make of car to damage from collisions. Dealers should be required to give new-car purchasers this information and the Department of Transportation should publicize it in plain language.

I believe comparative data is precisely the kind of information which consumers need in order to make a rational choice among competing products, and I would welcome the day when an advertiser boasts on national television that the latest results show that his particular model has the lowest incidence of collision loss.

It has been our experience that the development of this kind of informational competition should be encouraged as an alternative to either absolutely irrelevant advertising or a rivalry based upon groundless or deceptive claims which eventually require FTC intervention to deflate the rhetoric.

First, it represents a desirable form of private regulation in the sense that a competitor's unsubstantiated boast of uniqueness or superiority can be debunked by a few well-publicized statistics which will do the job faster than any legal process.

Second, this kind of disclosure may quickly produce pressure for actual change even though the general consumer population may not be influenced by the information. All that is really necessary is that comparative collision data influence the purchasing habits of some consumers. If the number is not insignificant, the message will not be lost on the decisionmakers in Detroit and the result could be improved cars for the entire population in short order.

We have seen this phenomenon occur already in the design area where a significant, although by no means overwhelming, majority of the population has indicated a preference for smaller compact cars. The response of the manufacturers to the influence of this segment of the population has resulted in the availability to all of a greater choice in car sizes.

Turning to the section of the bill which would establish a uniform titling code, I believe that is desirable to meet the national problem of reducing car thefts and to aid in locating cars which are recalled by the manufacturers for safety defects.

Finally, I support the objective behind title V of the bill which requires, before sale and after repair following crashes, that all cars, new and used, be inspected for vehicle performance by an independent diagnostic center. Certainly, the facts presented by the Commission in its warranty report in support of federally imposed minimum standards of quality, durability, and performance argue equally for this more limited proposal—presale independent testing. The warranty report said:

1. Inadequate quality control at the plant and poor predelivery inspection procedures has resulted in a substantial failure by the automobile industry to meet its obligation to provide the public with defect-free cars.

2. The industry response to consumer complaints about the quality of cars has been to issue formal warranties, but due to inadequate com-

pensation for warranty work and other factors, express warranties have proven to be largely illusory in protecting consumers. And while the consumer may have a legal remedy under implied warranties, litigation is far too expensive, too time consuming, and too mysterious and uncertain a procedure for all but a handful of purchasers to pursue to a successful conclusion.

3. Redress of legitimate consumer complaints through existing Government machinery such as invoking section 5 of the Federal Trade Commission Act is of limited utility. For example, we have no evidence that the handful of Commission cases against the most egregious deceptions in the auto repair field, including those involving unnecessary repairs or repairs never made, have substantially improved the overall quality of service.

Complaints followed by extensive litigation do not remedy the fact that the Commission possesses neither the physical facilities nor the technical expertise required to conduct an effective program of monitoring quality control and performance. This does not mean that we have abandoned the auto field—we are taking a hard look again at current warranty and advertising practices for the purpose of assessing realistically what we can do. But we know already that the Commission's procedures, facilities, and resources are inadequate to carry out a program under which the manufacturers, dealers, and repairmen could be held to appropriate standards, and other alternatives must be considered.

I believe the provision for inspection in S. 976 may be a step in the right direction in eliminating defective cars; assuming, that is, that defects in existing State inspection systems are also eliminated.

To the extent that the inspection provision covers sale of used cars, this represents a significant breakthrough for the poorest segment of the consuming public who have traditionally been victimized by sharp practices. And all segments of the consuming public should benefit from the provision in the bill which would require that repairs on safety-related parts be checked out after crashes.

This bill says, in effect, as the Commission said in its warranty report, that in present-day America where the automobile is no longer a luxury—it is the only available or practical means of transportation for millions—government must assume a positive role in seeing that our citizens get defect-free cars which can be maintained at reasonable costs. I agree with this purpose of S. 976.

Thank you very much.

Senator Moss. Thank you, Mr. Pitofsky, for that very good statement. We are glad to have it.

You mention in your statement that repair complaints were among the most frequent type that come into the FTC and other consumer protection agencies.

Do you think that diagnostic inspection would improve the complaint frequency by helping the mechanic to locate the items that need repair and by giving the consumer assurance that he is not being bilked?

Mr. PITOFSKY. I think if those centers are run competently that it would reduce those complaints. It would catch those complaints at an earlier point, so that they would not develop into the kind of consumer dissatisfaction that we see in complaints sent to our agency.

Senator Moss. What is your opinion of the provision that would prohibit the inspection agency from also being the service agency to make the repairs? Do you think this gives the consumer protection, or does it increase costs and it, therefore, would be undesirable from that standpoint?

Mr. PITROFSKY. I am somewhat hesitant to take too definite a position in this area. I think there are some open issues about these diagnostic centers. For example, what will the costs be? It would be unfortunate if the cost for inspection of cars at one of these centers turns out to be something like \$15 instead of \$2.50. I think there are questions relating to serious consumer inconvenience if the centers are not run efficiently, and also questions about whether they could best be operated independently. My inclination is that they should be independent, but I have not really given that particular matter a great deal of study.

Senator Moss. Do you visualize some sort of a standardized type of operation that constitutes an inspection system? What I have in mind is a place you go into almost like getting a physical examination. They have all sorts of machines to test different parts of the vehicle as well as a visual inspection.

Do you think there ought to be developed sort of a generalized inspection technique that is a required minimum?

Mr. PITROFSKY. Yes, I do. I think that is feasible, this would be the most effective way of dealing with this problem.

Senator Moss. You support the attempts of S. 976 to promote information competition, and some critics of this legislation are skeptical about the bill's seeming reliance on this informational competition as the means of forcing the auto makers to tackle what you refer to as preventive engineering.

What aspects of the bill do you consider encourage information competition? Do you have any suggestions for strengthening this provision?

Mr. PITROFSKY. Let me say at the outset that informational competition is not going to solve all the problems, but I do think it is an important step in the right direction.

As I recall the bill, section 125 requires that the Secretary of the Department of Transportation conduct tests to develop information about the ability of cars to withstand low speed collisions without incurring enormous expense to the owner, and then 127 (a) and (b) require that the information be made available and disclosed to insurance companies and to consumers.

I believe these are steps in the right direction.

I do notice in the bill that there is some ambiguity as to whether there is going to be a requirement that this information be disclosed to consumers as opposed to a provision that it be there and available for consumers who ask for it. I think the bill should be drafted in such a way as to insure that consumers will have access to this information, and therefore should provide that the information must be given to consumers.

I also would hope that it would be made available in simple and plain language so that consumers will be in a position to make effective use of that data.

Senator Moss. Do you see consumers beginning to utilize the informational competition that exists now? Are they beginning to use this and relying on it?

Mr. PITOFSKY. Of course, the first thing to note is there is not a great deal of informational competition going on right now, so consumers don't have a great deal of relevant data, with respect to price, quality, and durability, which they can use to make their own sensible determination.

To the extent that there is such information, our experience at the FTC is that it definitely is used.

I might mention two areas by way of examples. One deals with the hearings that we have held on disclosure of octane ratings with respect to sale of gasoline, a rule that we have now promulgated, and the second has to do with hearings that have been held as to disclosure of care labeling directions for wearing apparel. Our hearings indicate in both those areas that that information is much desired by consumers and it is predictable that the information will be used.

I might also add that our record in the care labeling matter indicates that in Europe and Canada, where very substantial care labeling information is made available to consumers, they use it and they use it effectively.

Senator Moss. I am sure you are familiar with Ford talking about safety. Is Ford promoting informational competition in this?

Mr. PITOFSKY. I am sorry?

Senator Moss. The ad that comes on television talking about the safety features of Ford products. It is a pitch on safety features. I wonder if that is any kind of informational competition.

Mr. PITOFSKY. I am not familiar with that advertisement. It would depend whether it is image-oriented and vague puffing, on the one hand, as opposed to giving the consumer hard data, on the other. It is the latter that makes for effective informational competition.

Senator Moss. In your statement you referred to the study that the FTC is making an investigation of the automotive parts industry. Is there a time you have set when we might expect that report to be available?

Mr. PITOFSKY. That is a matter that is in the Bureau of Competition rather than my own Bureau, and I am afraid I don't have an estimate. I am sure I could obtain one and supply it to the committee. I am not sure where that project stands.

Senator Moss. I may be asking you although it is not directly in your department, but I was wondering if this investigation on automotive parts would cover the situation where the damaged part of the vehicle is, of course, made only by the manufacturer of that particular vehicle. If it is a Ford, it is a Ford fender or whatever. And I wonder how we might reach this so-called captive market that is thus provided to the manufacturer of the vehicle.

Do you have any suggestions on that?

Mr. PITOFSKY. No. Let me just say that the allegation that there is a kind of vertical integration or captive market is very much a part of this study. It is under review right now within the staff, and I have no suggestions or predictions as to what kind of proposal will come out of that study.

Senator Moss. Is the Commission study also looking into the complaints by consumers that the insurance industry is failing to get policyholders' cars promptly repaired following crashes?

Mr. PITOFKY. I am not aware of any study at the FTC along those lines.

Senator Moss. Does the artificial labor cost which the insurance industry alleges force them or is forced on them by repair shops contribute to the shortage of qualified repairmen?

Mr. PITOFKY. I don't think the Commission is looking into that question, and I really have not studied it sufficiently myself to have an opinion.

Senator Moss. Will this be part of that study on prices and costs of repairs?

Mr. PITOFKY. I am not certain of that.

Senator Moss. Will the preliminary injunction power help the FTC to better control automobile repair practices?

Mr. PITOFKY. Well, certainly the preliminary injunction power will allow the Commission across the board to be more effective in its consumer protection operations. I can imagine, for example, the preliminary injunction coming into play with respect to certain kinds of advertising exaggerations.

So far as repair practices are concerned, I can imagine a case in which a preliminary injunction would be in order, but to be candid about it, I don't believe that that is the central problem that we have to surmount in order to be effective in this area. I think on the contrary that the automobile repair problem is so pervasive, involves so many different business units, that it would be difficult for an agency like the Commission, operating on a case-by-case basis, to ever deal effectively with that problem.

It seems to me it would have to be solved either by rulemaking within the Commission or by legislation.

Senator Moss. When you say that S. 976 is a good initial step but we have to go further, what do you mean? Are you referring to your recommendations for establishing Government performance standards in automobiles, recommendations growing out of your warranty study?

Mr. PITOFKY. Yes, exactly, that is a matter that has been under very serious review in the FTC and I would hope that we will have something for this committee very shortly on that, perhaps within the next month.

Senator Moss. Thank you.

Our subcommittee chairman has joined us now. I am pleased that Senator Hart is here. I don't know whether he has any comments or questions.

Senator HART. Thank you, Mr. Chairman. I apologize. I was testifying before the chairman of the Commerce Committee in his role as chairman of an appropriations subcommittee.

Senator Moss. Very good.

Senator Baker?

Senator BAKER. Mr. Chairman, thank you very much.

I, too, apologize to the subcommittee and the witness for being late, but I have read his statement and I have one or two questions

that I would like to put, in order to clarify the testimony. You may have touched on these before I arrived. If so, I apologize in advance for being redundant.

In your statement, the first paragraph, you state that you are speaking as a member of the Commission's staff but not for the Commission.

I would appreciate it if you could tell me if this statement and the positions expressed in it have been submitted to the Commission or cleared by the Commission for these purposes today?

Mr. PITOFKY. No; most definitely not.

Senator BAKER. In your statement you point out that former Chairman Weinberger in testifying last year before this committee referred to restrictive practices and the elimination of competition at the manufacturing level as well as competition between independent body shops and franchised dealers.

Has the Commission investigation of the competition between independent body shops progressed to the point where you would indicate whether or not the legislation being considered by the committee would have any effect on the disparity of prices often encountered by the consumer seeking repairs? This was a point touched on in yesterday's question by Senator Griffin of Michigan.

Mr. PITOFKY. I had touched on that in one of my earlier answers. That particular study is in the Bureau of Competition rather than the Bureau of Consumer Protection with which I am involved, and I do not know the scope of the study. I don't know exactly what matters are being taken up in that study. Therefore, I am very hesitant to comment on whether it would deal or not deal with that problem.

Senator BAKER. I apologize for asking a question beyond the jurisdiction of your division, but, since it was mentioned in your statement, I thought you might be in a position to elaborate a little further.

Thank you, Mr. Chairman.

Senator Moss. Thank you very much, Mr. Pitofsky, Mr. Martin, and Mr. Needelman. We are glad to have you here for the committee and we appreciate very much your testimony.

Mr. PITOFKY. Thank you.

Senator Moss. Our next witness is going to be Mr. Paul H. Taylor of the Taylor Devices, Inc., from Buffalo, N. Y.

I understand he has in addition to a statement some illustrations that would be of interest to this committee.

We are pleased to have you, Mr. Taylor. Will you identify your associate?

**STATEMENT OF PAUL H. TAYLOR, PRESIDENT, TAYLOR DEVICES CORP. AND TAYCO DEVELOPMENTS, INC., NORTH TONAWANDA, N.Y.; ACCOMPANIED BY DOUGLAS P. TAYLOR, DIRECTOR, RESEARCH, TAYCO DEVELOPMENTS**

Mr. PAUL TAYLOR. Thank you for inviting us to testify.

This is my son Douglas, who worked with me in connection with this. He is director of research of our research corporation, Tayco Developments, which is heavily involved in this.

I am president of Tayco Developments and Taylor Devices which manufacture the products.

We are now working with every major manufacturer in the United States and five or six of the Japanese and European manufacturers.

At the moment I hold 46 patents in the United States and more abroad on aircraft, on machine tools, high-speed automated equipment and energy suppression systems, energy management systems.

As far as my own credentials go, I am a licensed aircraft mechanical engineer, a graduate aeronautical engineer, and was director of research for a Maine company making machine tools and automated equipment.

We are talking here today primarily in connection with energy absorbers as we known them. Among other things which Taylor Devices make, we make a series of very precisional shock absorbers for the Saturn 5, the F-111, and other types of aircraft.

We also make commercial units for heavy mining equipment. One of our main items of products concerns a crane buffer used in industrial steel mills. We also are approved for use on railroads as cushioners and material of this kind. Horizontal shock mitigation has been part of Taylor Devices and Taylor's work for almost 14 years.

We were called by Ford Motor and American Motors almost simultaneously to work with them on this energy management situation with regard to the energy bumper. We pioneered in this molecular compressibility field which includes using the space between molecules as an energy source.

The same material when shoved through an orifice with our fluid amplifier approach which we have pioneered provides almost a constant force shock absorber with a very few parts and at extremely low cost.

For your information, we have quoted Ford and others approximately \$2 a unit for the bumper shock absorber in volume production and are prepared in connection with a Toronto corporation to produce the cylinder parts in the joint operation in Toronto or in the Canadian side for U. S. manufacture.

Senator Moss. By \$2 a unit, would that be the whole front bumper or are there two or more of these shafts? Maybe I am premature.

Mr. PAUL TAYLOR. There is the \$2.80 LTD shock absorber. This particular unit which you see here has passed all specifications. The unit has taken the original specification put out by the DOT—the original specification as put out. We are the only one that took a 45-degree impact in the original specification and passed every single specification put out originally by the DOT.

Now, with the watering down of the spec that occurred under the DOT, this same unit to take the specification that the DOT amended it to, this will take a 5-mile-an-hour barrier crash into the unit and will cost approximately \$1.60 to produce.

Both units are qualified. The material has been submitted to every major manufacturer.

Senator Moss. Well, the estimate then that it will cost \$100 on every unit produced is a little high; isn't it?

Mr. PAUL TAYLOR. I would assume so from my experience in tooling and elsewhere.

In fairness to the automobile manufacturers, they are entering an area that they are not that familiar with where high-strength materials and other stuff must be used. The experimental car which we will

show to you we have been promoting with them the use of high-strength steels in the bumper which will not affect adversely the passenger car handling characteristic and at the same time provide the necessary cushioning to absorb the energy of the bumper.

Now, the actual unit that we are trying to promote now is a smaller unit to meet the new DOT specification. We have been into these people and of course with the watering down of the spec, there is a tendency to go to something cheaper and made in-house. This is typical of what could be expected. They are after a profit, naturally.

The material that we have been working with has very unusual characteristics, and there are two other devices that are proposed for this use that have the same characteristic. This is an almost constant force. We are the best of the bunch. We show a 98-percent efficiency in some cases and in some cases as much as 95.

Let's suppose the crush strength of a car frame is 10,000 pounds. This particular unit at 10,000 pounds that you have in your hand, Senator, actually is a 9,500-pound shock force unit, 3½ inches. That will cushion an LTD at 5 miles an hour into the barrier on each frame rail and at 45 degrees to the corner end, and has done so at Ford Motor.

Mr. DOUGLAS TAYLOR. Just one of those particular units applied to the Ford LTD would absorb the full energy under the present spec. Two of those units would add to that force level. If mounted onto the car, it will meet the earliest proposed DOT spec which included a 45-degree angular pendulum input or on rail inputs, inputs into the center of the bumper itself.

The unit to meet the DOT spec as it is presently written if it was to be used as you would normally with two units per bumper on the vehicle, is roughly about two-thirds the size of that one and uses around a 2½-inch stroke. This would be for the average-size-to-intermediate car.

Your light cars require an even smaller unit. Your much heavier cars in the luxury-car class would require a somewhat larger unit.

Mr. PAUL TAYLOR. Some idea of the force of that unit, so that you may get some standard to go by and understand that the automobile people look at the problem rather in a difficult sense, that is a standard Ford shock absorber. Our shock absorber is equal to 60 of the standard Ford shock absorbers in energy capacity.

Senator MOSS. It will absorb 60 times as much?

Mr. PAUL TAYLOR. You would have to have 60 of these shock absorbers to absorb the same energy as this one does as presently rated.

One of the problems is: this is new technology to these people and they are not moving as fast as I would like them to move, naturally; but the energy involved is tremendous taken into the frame.

Our opinion has been for a long time that this could be managed better than it was in the various fixtures and materials that we have. We have made up frame attachments, the bracket and attachments, and now, finally, the bumper, ourselves, to take this to these people and say, "Here, you can do this; it is within the technology; it is not as difficult as you think it is."

My son has in his hand a complete attachment taken to Ford which has been adapted to some extent. This is the frame bracket which attaches to the frame rail and this attaches to the bumper.

Mr. DOUGLAS TAYLOR. It is taken apart like so. This small device in here is the energy absorber. This section here bolts to the bumper of the vehicle, and this section here bolts to the frame of the car.

As to the cost, this is the total bracket assembly. This is a bolt end installation. It bolts right into your vehicle, in many cases without a modified frame on the vehicle. There is no stiffening required with many of the hydraulic energy absorbers that are on the market today.

As to cost, if we are willing to sell this unit in the under \$3 range, you can figure out pretty much for yourselves how much these small extruded aluminum brackets are going to cost.

Mr. PAUL TAYLOR. We don't think we even had in those original designs the best or the cheapest that could be done. Recently in desperation after hearing these comments on the cost, we proposed and built a car that is available here today for examination and on which we have movies and film clips of testing performed just last Friday when we decided we had to move. We said according to our calculations, an existing car right off the line ought to be able to take 10 miles an hour head-on into a barrier and 5 miles an hour in the back. That is four times the present DOT spec.

We have to remember the energy goes up by the square of the velocity. Therefore,  $2\frac{1}{2}$  miles an hour is only 25 percent of 5 miles an hour, and 5 miles an hour is only 25 percent of 10 miles an hour.

Now, in our early test just last Friday, we passed every single test, and we did do a 10-mile-an-hour impact. All tests were certified by an independent appraisal. No damage on the front at  $7\frac{1}{2}$  miles an hour and no damage on the back through 5 miles an hour.

Seven and a half miles an hour is double the present energy levels that it has been said they could meet. On the 10-mile-an-hour impact, we had been supplied an experimental car by the manufacturer to inhibit engine movement forward and that failed at 10 miles an hour.

Apparently, there was some consideration that they were supplying a 6-mile-an-hour unit. I guess they didn't know how fast we were going to hit the wall. There was minimal damage done to the car.

We have omitted it from the film clip since we have shown only items of zero damage.

Mr. DOUGLAS TAYLOR. Repair due to these experimental parts by the manufacturing failure was \$91.70. This compares quite favorably with the present figures which are readily available from the Insurance Institute, some of their writeups, which I believe is in the \$400-to-\$700 range from a permanent barrier impact of this velocity.

Senator MOSS. Just what kind of damage was it? Was it on the internal part?

Mr. DOUGLAS TAYLOR. No; this was the motor of the car, normally rubber, which isolates the mass of the engine from its own vibrations. Obviously, with the mass of a typical American car engine, well above 450 pounds in most cases, you have a tremendous amount of stored energy in the engine when the car hits the barrier. The engine is not rigidly connected to the frame, so those engine miles have to absorb the travel of the engine.

You can't take it on the rubber. So this particular manufacturer made especially, hopefully for a prototype 1973 engine mount, a couple of mounts with little steel buffers in them. So if you used up the travel in the rubber mounts in the collision, this little steel section would pick

up one of the steel components that are bolted onto the body of the car, the frame of the car, and it would absorb the energy.

As it was on this impact, he didn't have enough area on the steel mount and the engine mount came out and loosened up in the front, allowing the strength of the engine to contact the radiator.

Senator Moss. This is the engine sliding forward?

Mr. DOUGLAS TAYLOR. Yes. The manufacturer assured us that he can fix the mount readily enough at virtually no additional cost by adding a little bit more steel and it should be able to take it with no problem.

Problems like engine mounts vary between manufacturer and even between different cars of the same make due to the fact when they put the engine in the car, in order to not transmit any of the engine vibrations to the vehicle, different engines require different rubber mounts. Some require much softer mounts than others.

Mr. PAUL TAYLOR. Actually there was zero damage to the exterior of the car. It has been not touched since last Friday, and you gentleman can examine it yourselves.

There is an important thing we want to bring out here. We have contended since the public wants energy systems in their bumpers that they should make available a unit that would take the higher impacts as an accessory price, and we have designed our unit, the aluminum unit that you saw, to take 5-miles-an-hour impact using the jacking tool, the tool that you see, and at the manufacturer's option he may submit in there a steel unit which will take the same car at 10 miles an hour without any change whatsoever, just snap in place, and he has a 10-mile-an-hour system to be prepared for the 1975 cars.

Senator Moss. Would that increase the cost of the unit?

Mr. PAUL TAYLOR. That unit cost would probably go up about \$2.50 I would judge because the steel cannot be impact extruded in the extrusion process as yet. The processes are coming. It may be done very shortly, but at the moment it cannot be coat extruded of steel. It would have to be made out of tubing which is welded which will increase the cost a couple of dollars per unit.

In connection with this, I should like to say one thing. We have already had a car at Ford Motor, a safety car, that has used our units that will go to approximately 50 miles an hour with no problems. The units have been crashed into the wall two or three times at 50 miles an hour and were operable after the crash.

It works in conjunction with other safety elements that Ford has developed which I am not at liberty to disclose. The same units will take the car into the wall, that particular car with the stronger frame, into the wall at 27.8 miles per hour or car to car at 55 miles per hour with absolutely no damage.

This we have verified in our own independent test in our own laboratory. So, there doesn't seem to be in the present technology as we know it any limitation except that of cost. As you go up to the larger units, the cost increases in proportion to the size of the unit and that goes up by the square of the velocity.

So, for 50 miles an hour, the unit gets quite a bit more expensive. However, that same unit if it were adapted as part of the car frame and other things that could be done would not be near as costly.

The same structure could be used as car frame.

In connection with all this work that we have done, we have been quite concerned with certain trends that we see that we think need examination by Federal authorities in connection with this. Everyone has been looking at protection of the car and no one has been paying any attention to protection of the individual that is riding in the car.

In this particular instance the best type of shock absorber ever devised to protect the individual was the crushing front end. The shock absorber which does the same thing must do it not to increase the energy applied against the passenger so he becomes a ping pong ball being thrown around inside the car. Certain of the systems under consideration and documented in our talk are just this kind of a system.

One of them in particular being considered by a major manufacturer by his own admission gives back 25 percent of the energy of collision which can only go to one place, the passenger. The other one is even worse. It is a rigid system. A rigid system at  $2\frac{1}{2}$  miles an hour in our opinion may offer serious damage to a passenger—at as low as  $2\frac{1}{2}$  miles an hour.

In conjunction with this, my son has run instrumented tests on dummies in connection with the State University of New York at Buffalo which prove that this is a dangerous thing and requires much more study than the limited study we have made of it. I will let him take over from here and explain what he has done and what the significance of this event is.

MR. DOUGLAS TAYLOR. As you know, the DOT, of course, has given to us the S.S. No. 215, which requires that all 1973 vehicles be able to withstand a frontal barrier impact at 5 miles an hour, and a rear barrier impact of  $2\frac{1}{2}$  miles per hour, with zero damage to the Federal safety equipment.

Now, Federal safety equipment includes the lights, the horn, cooling system, fuel system. It doesn't include any of the sheetmetal parts, it doesn't include your hood, it doesn't include bumpers.

There are many ways to meet this spec. In fact, I would wager to say that a good many cars on the road today with crushable structures as they now have, will meet this spec. If you want to go with energy absorbing devices of some sort to meet the specifications that now stands, you can meet it in two ways.

One would be to make the car perfectly rigid. In other words, beef it up, beef your frame rails, beef your bumper, beef all the sections that have to take the impact force.

Now, any kind of input energy into a vehicle must be dissipated as an applied force over some amount of travel. In other words, you have to apply a force for a certain distance to absorb a certain amount of energy.

If you make a rigid system, you cut the travel down to a very, very small amount, and hence, the force which must be applied to the car and hence to the passenger, increases greatly.

If you make a rigid system, if you have your travel of that system go toward zero, the force which must be applied to the vehicle goes upward ad infinitum.

What it amounts to, right now what we did for some tests at the University of Buffalo, we took a simulated intermediate-size car with an effective mass weight of 3,400 pounds. Now, we mounted on this car two different types of energy-absorbing bumper systems. One was the tail, or liquid spring shock system.

In fact, we mounted a system that was basically designed for the intermediate-size car—Satellite, Coronet, cars in that range—mounted that on this car and ran it into a barrier.

Mounted in the car in a standard automobile bucket seat, wearing a lap belt, was an instrumented dummy with all the masses and resiliency specs that a human body duplicated.

Since we assume that for a collision of this nature, most of the damage which would occur would be in the form of a whiplash injury, such as you hear bandied about quite often, we mounted an accelerometer between the eyes of the dummy, ran it through a charge amplifier into a visual output on an oscilloscope screen and took pictures of it at the moment of impact.

We ran the car with a tail or liquid spring system, a system which on impact supplies basically a square wave of output, a constant force over about 2 inches of travel on this particular one, and it returns quite slowly, it comes back in 2 or 3 seconds.

A measure of how fast an energy-absorbing system returns is called the coefficient of restitution, which for a barrier crash is simply the velocity at which the car leaves the wall divided by the velocity at which it goes into the wall.

So far this system, with the very, very low return time from the liquid springs, the coefficient of restitution of this energy-absorbing system approached zero. We ran the car into the wall, we monitored a 5 G deceleration on the vehicle—this is at 5 miles per hour—5 G's on the vehicle, 5 G's on the passenger's head, but the maximum G's on the passenger's head did not occur as it went into the wall.

It occurred because the passenger stretched forward under the impact force basically because his mass was not rigidly affixed to the car. The passenger stretched forward, and as the units came to their full travel, an instance afterward, the seat belts acting as a spring, snapped the passenger back into his seat.

The total history of the passenger through the collision was about 3 G's going in and 5 G's rebound back into his seat.

We took the liquid springs out. We put in what would probably be the purist technical definition of the system with a coefficient of restitution of 1.0. We put in a battery of 18 automotive coil springs.

I might add that those of you who think that 18 automotive coil springs is a tremendously stiff bumper, it is only equal in energy capacity to one of these units and uses twice the stroke of this unit at any given energy input.

We took 18 automotive coil springs, mounted them on the bumper, smashed the car in the wall with the coil springs on them.

Again we recorded 5 G's on the car because we had picked the number of coil springs to give us equal G loadings with that impact.

Now the passenger again lagged the response of the car in his response. He was moving forward stretching his seat belt as the car was being stopped. As he came out, the instance where the passenger was farthest out in his swing forward, the coil springs began firing the car back. The passenger violently rebounded into his seat, in fact he rebounded into his seat with a series of impressions in the seat, bumps back and forth.

The G-loading history on that passenger showed 5 G's going in and 10 G's going out.

Now, 10 G's applied to a person's head—your head weighs 25 or 20 pounds—you are talking of a 25-pound force, which multiplied by 10, gives an equivalent of a 250-pound force on your head, shoving you back into that seat.

We feel pretty sure, after monitoring G loads of this nature, that with a system which has a high coefficient of restitution such as a spring system, basically the kind of system that many manufacturers are looking toward to meet this present Federal specification, that whereas damage claims for the vehicle itself may decrease, we feel this will be countered by a greater increase in liability claims due to the fact that people are going to be getting whiplash injuries rather than just costly crushing their fenders and such.

There are other types of spring systems on the market right now in addition to a steel-type spring. Some of the manufacturers are looking into rubber springs. This would be a solid chunk of rubber, which you either compress or you would sheer when you impact the wall.

Now, a rubber spring works better than steel springs in many respects, because it doesn't fire back quite as rapidly. But it only works well at ambient temperatures. You take a rubber spring down to  $-10^{\circ}$  and the rubber is virtually solid, and the applied force of the vehicle, instead of having 5 G's for a 5-mile-an-hour impact, you are talking of 15 to 20 G's.

When you get up to that range, the passenger won't have to worry about any whiplash, he is going to be suffering enough from the basic input to the wall.

The Federal spec does not bother to mention anything on what temperature this system has to work out, it doesn't go into what type of loadings the passenger has to withstand, it doesn't mention the type of G loads the car has to stand.

It is quite possible to meet the Federal spec in a way that will kill the passenger each and every time at a 10-mile-an-hour impact with no problem whatsoever.

The question is, what good would a specification be if it protects the vehicle at the expense of the most important component in that vehicle, namely the passenger.

Mr. PAUL TAYLOR. In connection with this, we feel that this requires a good deal of investigation quickly. The timing for getting these systems in production is around July of this year, and once committed, it is very hard to reverse sights.

There are adequate research facilities, independent ones around, to which the manufacturers should be required to submit cars that they think may pass these specifications, and determine the effect on the dummy or on the passenger.

We have to consider that cars are built not for astronauts, but primarily for little old men like me and young girls and pregnant women, and old ladies and old people who are subject to blackouts at much lower limits than an astronaut might be.

There are occasions when a person could not leave a burning vehicle from a 5-mile-per-hour crash, and there have been instances where gas tanks have left cars at 5-mile-per-hour collisions. It is a very serious matter and we recognize we won't make many friends with some of our statements here, but to me the preservation of human life is of first importance.

Certainly we don't want to go backward. If we are trying to improve things, we want to go forward.

Getting back to our technical aspects before our photographs go on, we have taken the liberty of taking one of the standard sections of a current bumper system which you see here, and doing the same thing in high-strength steel.

The crushing loads of these two elements—this is the bumper you will see on our Hornet that hit the wall at 10 miles an hour—the crushing loads of these two sections are roughly 10 to 1.

Doug, do you remember the numbers you ran on the test?

Mr. DOUGLAS TAYLOR. For the standard American Motors bumper, we put the bumper in a compression tester and crushed it. We plotted a curve for displacement.

The bumper started to crush after being displaced at 50-thousandths of 1 inch. At that point the force shown was 700 pounds.

The bumper section continued to crush at this 700-pound level for four-tenths of an inch of travel at which time it finally violently buckled and that was the end of the section.

We took a similar section made by our plant, and as you can see from comparing the two sections, the one which we made is virtually the same thickness as the standard American Motors bumper. The difference is that we have replaced the normal cheap low-carbon steel which Detroit has been using for years, and years, and years. We have replaced it with an alloy of stainless steel, which the aircraft industry has been using for years, and years, and years.

The difference in cost between a steel section, a steel bumper section beefed to withstand force levels equivalent to what that stainless steel bumper section would withstand in a low-weight configuration, is almost no cost differences.

That thin stainless bumper section took quarter inch displacement and moved up to a crush strength of 6,000 pounds.

It maintained that 6,000-pound force level for nearly a half inch of travel at which time it slowly and very gently buckled into the final shape that you see it in now.

So, you are talking of a difference of energy capacity, the energy that bumper could absorb of probably a factor of 20, in that range.

Mr. PAUL TAYLOR. Now, in fairness to the automobile people, they have just recently been exposed to these steels. We have taken them to them and they are building and experimenting with bumpers of them. After this last test which was witnessed by American Motors executives, they asked if we would immediately take this car to Detroit, our Hornet, which you will see on the photograph today, for their examination of the bumper.

One of the most costly points on the bumper system has been the attachment to the bumper itself. The bumper because of mismatch and override and underide and other things tends to twist off, and carrying that force from the bumper into the ice later is a very difficult thing. You have a 7-inch bumper and you are taking it into a 1¾-inch cylinder. This has been one of their major problems. So we elected only 2 weeks ago to build the bumper, first showed and built the bumper and put it on the car and, as you will see in the photograph, it has performed admirably.

They have asked us to deliver the car to them. It is a very simple bumper attachment, simpler than what they have been considering,

and possibly it will cause a reduction in their estimates that they are now putting out.

I think in fairness to the estimates, and I just digress here for a moment, when the figure was quoted, a substantial figure by Ford internally for putting our product in production, I blew my stack and from certain investigations there was a few fudge factors in it which a manufacturer always does. If you tell them they have to build this, they will say I need \$2,000 to do it. When you get down to analyzing it, you get down to \$300.

A lot of the figures that are quoted are first figures off the top of the head of the automobile men. But they are certainly not realistic in regard to final production I am certain.

Mr. DOUGLAS TAYLOR. I would imagine the emissions control people have about the same statement to make on that as we do.

Mr. PAUL TAYLOR. I think if we can see our movies we can probably show what it is possible to do to these components we exhibited here.

Mr. DOUGLAS TAYLOR. Before we go to the movies, the car you will be seeing in these films has not been modified structurally by any method whatsoever. We put the bumper system on in about 4 hours' worth of time. The rears was mounted by cutting a couple of holes into the channel section.

I might add the channel section is the same 30 to 40 thousandths thick material that everybody in Detroit has been using for years. The front end is bolted directly on the standard American Motors frame rail. The only modification of the vehicle whatsoever was the addition of some stronger motor mounts as I have already mentioned. They were experimental MC devices designed basically to meet the 1973 spec as it now stands.

Mr. PAUL TAYLOR. They weren't strong enough.

(Whereupon, a movie was shown.)

Mr. PAUL TAYLOR. I think that about concludes our testimony, gentlemen. We are ready for any questions with regard to it.

I believe there is a car somewhere downstairs trying to hit some wall. It has been a problem trying to determine where to hit the wall, to find someone's property that you could do this on.

Our liability insurance isn't very high.

Senator HART (presiding). Thank you, gentlemen.

I and a good many people in this hearing room have sat through a number of these films, this type of showing. A couple of years ago we saw the first films produced by Dr. Haddon, then we saw the updated version just a few weeks ago, and now we have seen yours.

The question just screams out for an answer: Why haven't we done vastly better in the Department of Transportation's standards; why the heck do I have a bill in here that says by 1975 they will have a 5 and 5?

Mr. DOUGLAS TAYLOR. Senator, if I may digress upon your statement a little bit, our company has sent in at least four rather violent comments contrary to the DOT specs when they were in the stage where you were free to comment on them. I know in addition to us, Dr. Ezra of the University of Denver has made some rather violent comments. I think I received one reply back from DOT telling me that they had referred my last comment to somebody, from which I

never heard any reply whatsoever. I have had no reply from the DOT on any of my comments.

They have been fully documented. I have given them all the data they have required. I have written on the spec part by part. When we did this test with the instrumented dummies, we contacted members of the auto companies and told them if they would send us samples of the energy absorbing devices they were playing around with in their labs, we would test them free of charge, and the auto companies declined.

I think until the Federal Government makes a spec which is rigid, that the auto companies are just going to meet the bare minimum. They will always meet the minimum. I have yet to see an auto company say that their cars produce only half the emissions that the Government requires.

Senator HART. Without getting into the admittedly tangled question of whether you achieve better performance by having minimum standards or by having simply a broad directive and having an agency fix standards, we will hear from the Department of Transportation before these hearings conclude this week, and I would anticipate that they will be prepared to answer the question which will be addressed to them. How come you set standards to be achieved by 1973 of 5 and 21½ when there is a fellow in Buffalo that shows live, in color, that it is in reach now?

Mr. DOUGLAS TAYLOR. I might also add there is a couple of fellows in California that have systems that work. In fact, offhand I can think of at least seven completely different types of energy absorbing systems, all of which will work, none of which are dangerous to the person or to the vehicle and all of which will offer not only zero damage to safety equipment but zero damage, period, to vehicles.

Mr. PAUL TAYLOR. Senator, if I may reiterate one thing that I have been pushing at the automobile companies very strongly. A vehicle is primarily a means of advance for human beings. If it doesn't protect the human being, it ought to go back to crushing the fenders, because that is a better system than some of the systems that are now being considered that will pass that DOT spec.

Senator HART. Everyone who sits around and says what we are trying to achieve, as I understand it, is to reduce the 50,000 Americans killed in automobile accidents, reduce the amount of property damage and personal injuries and reduce the property repair bill in a way that is compatible. I think that is what we have agreed to pursue.

Mr. PAUL TAYLOR. I am sure that is the intent.

Mr. DOUGLAS TAYLOR. The unfortunate thing is the Federal spec as it is now worded really doesn't decrease property damage at all. I am sure there are many people in the room right now that can recall an accident with their car where they ended up with a \$400 bill for sheet metal, but the horn worked, the radiator stayed good, and the fuel tank stayed in the car.

What is the purpose of the spec if they require equipment to be salvaged after the crash which usually isn't damaged?

Senator HART. That is still another chapter. But the more critical thing I think and one that we ought not to be diverted from is the need to get a solid answer to the question whether it will be possible in the next model car to have a bumper which reduces substantially the

damage to the occupant and substantially eliminates the damage to the property. Unless my eyes deceive me, I just saw one.

Mr. DOUGLAS TAYLOR. That bumper system we quoted to all the auto companies, and we are offering I believe a 3-month leadtime, 3 months after receipt of order for first delivery.

Mr. PAUL TAYLOR. With the aluminum extrusion process, the capacity is already at hand to turn it out.

Senator HART. The cost figures you have given them?

Mr. PAUL TAYLOR. They were quoted these figures in an official quote.

Senator HART. Let me make clear, I have never been a purist on the question of cost benefit. When the auto safety bill went through here, I took the position that the requirements that should be fixed by the Department should be feasible ones, and I make no apology for that. Hardly anyone can plead innocent of having used dollar savings to avoid some safety protection. I don't know anybody who puts his family in a home that couldn't be a safer home if he wanted to buy everything that would make it safe. But we don't. And we ought not to point fingers at others for raising this question. But having said that, if you can put that business on for \$2 or \$3 and achieve the life-protecting and property-protecting results, if in fact this can be done in the range of the figures you are quoting, it could be done *nunc pro tunc* assuming—let me ask, you have no idea as to how many lives will be saved, how many injuries?

Mr. PAUL TAYLOR. I wanted to get to that, Senator. I think we need to correct a misconception there. The crushing fenders that you have had have been an excellent shock absorber. The result is when you check the "G" loadings on our device against the crushing fender, they are almost identical. They can be made much lower on our device, but then the bumper must stick out from the car further, because for the lower the force you must lengthen the stroke.

So to protect the passenger at 10 miles an hour to the equivalent of  $2\frac{1}{2}$  miles per hour, I would say you need a 9-inch stroke device. They can be designed at some future time into the car, where the whole front end of the car will move in. With proper design, if you can limit the stylist—the engineers that these people have are excellent, and if they can be made preeminent so that they design the vehicle to do the shock absorbing that needs to be done, the 9-inch stroke which would protect passengers can also be incorporated. That would add cost however.

Mr. DOUGLAS TAYLOR. I would like to comment on that, too, I believe. When we first got into this entire project of the bumper shocks, and as we stated before the auto people came to us, we were told by the people that they would accept a  $3\frac{1}{2}$ -inch system, and that was it—that we would have to make what we could within a  $3\frac{1}{2}$ -inch travel. They said they could hide that and no one would notice they had an energy-absorbing bumper on them. We have yet to find a vehicle with which we could not meet the 5-and-5 capability with the  $3\frac{1}{2}$ -inch travel without crushing the frame. We can do it with unbeamed frames. If you want to go 10 and 10, something like that, you are going to require somewhat beamed frames. We usually set our units to the crash strength of the frame. Whatever the manufacturer quotes us, that will be the maximum force.

Mr. PAUL TAYLOR. May I add just one thing that may help us on reducing damage claims? The 10-and-10-mile-an-hour system which

you saw demonstrated, which has gone to 10 but there was some modification required, is a safer unit at 5 miles an hour than our 5-mile-an-hour system, because the stroke is 5 inches instead of  $3\frac{1}{2}$ .

So it would be safer to require a 10-mile-an-hour unit and have some limitations on it, and you have got a safer system at 5. At least the customer should have the option to buy these things if they are interchangeable.

Mr. DOUGLAS TAYLOR. There are systems which we are working on at the present time which normally, when the driver is driving the car, do not stick out at all from the vehicle. We have had a process which we have been using for military work for years now, since 1955, by which we can actually cause a liquid spring to be caught in the vehicle permanently, which, whenever an impact takes place, by means of—it is three or four very simple firing mechanisms—this spring system can be caused to extend in time to absorb the full energy of the impact.

We have sold systems like this to the military. The last one was to Goodyear Tire & Rubber, and it was a perfectly good, fail-safe device, has been around for years, and it is being evaluated by the auto companies.

Senator HART. What bothers me after seeing your pictures and hearing your comments is—I guess it is frustration.

If we think we are doing well to establish an authority in the Department of Transportation to fix initially safety related standards and our bill proposes property loss reduction standards, and there is a great hue and cry we shouldn't do that; we finally get over that and now the question is how we can do it, then the danger is we will assume that if the schedule is fixed with respect to the safety feature and if we get the bill through with respect to property damage, then progress is being made that is significant and the assumption would be that it is progress that would not be made absent the legislative/executive leverage; yet, if that is the way we proceed at the pace that we are going, the dramatic improvement that you describe as available will apparently never turn up.

Mr. PAUL TAYLOR. True; overcoming the inertiability in industry is a very difficult job. Nobody beats a path to your door. In this case Ford came to us, but you have to understand that we demonstrated cars to them  $4\frac{1}{2}$  years ago with a liquid spring system that would maintain the bumpers and they bought this, and those liquid spring systems were the ones that brought them to us the second time.

They are progressive people, these organizations, and then there are those who drag their feet—in my organization, too—and it is difficult to get the inertia going and sometimes it takes a push from above. I am going to get shot for that one.

Senator HART. That last model that you showed, that 5 and 10 miles against the barrier, that same model in the Insurance Institute films showed a front-end repair damage bill for a 5-mile hit as \$204 and at a 10-mile front-end hit of \$508.

Now, what damage repair cost was involved in your 10- and 5-mile-an-hour hits?

Mr. PAUL TAYLOR. It was approximately \$90. It cut a hole in the radiator. There was none at  $7\frac{1}{2}$ , none whatsoever.

American Motors is making some new motor mounts for us which will overcome that damage.

Due to the fact we wanted to present to the public a completely unmodified—unmodified by ourselves with respect to the basic mechanical components, we did not race the engine. We went on what AMC told us was a 1973 engine mount.

Senator HART. What was shown for the Haddon film was a repair bill equivalent to \$508. What you have shown is a repair bill of \$90, which itself can be reduced.

Mr. PAUL TAYLOR. Which shouldn't be there at all. It will be down to zero dollars.

Senator HART. What about the repair damage bill for your 5-mile an-hour hit?

Mr. PAUL TAYLOR. There was none.

Senator HART. As compared to a \$204 front-end repair bill and a \$104 rear-end repair bill of the same model.

Mr. PAUL TAYLOR. May I make a correction, sir. That was the same model, but I don't test lightly. That was loaded for bear. The station wagon is approximately 300 or 400 pounds heavier than the car that you were talking about. The station wagon is a heavier model. I picked the heaviest model on that car to demonstrate that even the heaviest could be protected.

So, that is really a more serious test than what you thought.

Also, the test was run with the engine running into the wall. In all tests presently run at Detroit that I have observed, the car is pushed into the wall. Now, on our normal testing—

Senator HART. Now, wait a minute, on the Haddon film—

Mr. PAUL TAYLOR. Yes, they were, but on the ones currently to pass the spec, the car is pushed into the wall. On our tests on crane buffers, for instance, we have to add about 15 to 20 percent more energy for the driving energy carrying it into the wall.

These are much more severe than what you are going to get even at 5 miles per hour on what the manufacturer is going to supply. They push them into the wall or tow them into the wall.

Senator HART. The comparison I made, I think, is a fair one.

Mr. Sutcliffe?

Mr. SUTCLIFFE. Mr. Taylor, in order to have a very clear record as to your cost estimate and so forth, let me go over some rather specific questions.

You have testified that you have submitted a bid to Ford Motor Co. for your attenuation devices.

Mr. PAUL TAYLOR. Right.

Mr. SUTCLIFFE. Could you please provide the committee with those figures as to what the bid was?

Mr. PAUL TAYLOR. They are included in the back of the committee's report that we submitted to them. There is a general impact extrusion quote. We are teamed up with them on a joint corporate effort.

Mr. SUTCLIFFE. For  $4\frac{1}{2}$  million a year it would be \$2.88 with the Teflon seal?

Mr. PAUL TAYLOR. That is this one.

Mr. SUTCLIFFE. And for the nylon seal it would be \$2.58.

Mr. PAUL TAYLOR. Right.

Mr. SUTCLIFFE. That is a firm bid from what corporation?

Mr. PAUL TAYLOR. General Joint Impact Extrusion of Toronto and Taylor Devices.

Mr. SUTCLIFFE. How many of these devices would be required per vehicle for 5-mile-per-hour front- and rear-end impact?

Mr. PAUL TAYLOR. The 1973 spec would require four of these.

Mr. SUTCLIFFE. So that we multiply four times that price figure for the impact device?

Mr. PAUL TAYLOR. Right.

Mr. SUTCLIFFE. Which automaker was that quote submitted to?

Mr. PAUL TAYLOR. Everyone except General Motors. We are dealing late with General Motors. We have orders and are working with them now, but there was a delay on our part because some patents were on file and our patent clause required a delay.

Mr. SUTCLIFFE. And the barrier impact capability of those devices is at 5 miles per hour for those cars?

Mr. DOUGLAS TAYLOR. Those devices are at about 7-mile-an-hour barrier. Those devices were done to the earliest Federal spec, the spec which really should never have been changed.

But that device is actually too large for the present spec by a pretty good factor. I imagine those prices for the minimal DOT spec for 1973 would probably see a price reduction of, oh, 10 or 15 percent.

Mr. SUTCLIFFE. As to the bumper itself, the metal that would be suspended between those devices, could existing bumpers be used?

Mr. PAUL TAYLOR. No.

Mr. SUTCLIFFE. If not, would substitute bumpers necessarily cost more than the existing bumpers to produce?

Mr. PAUL TAYLOR. They would cost more but not by that much of a factor. First, you forget the chrome plate and make it out of stainless steel, and use a high-strength alloy that would carry the loads.

Mr. SUTCLIFFE. Do you have any estimate as to the increment per unit for an average bumper?

Mr. PAUL TAYLOR. Well, to give you some idea how difficult that is at the moment, the steel in question sells if I buy it for aerospace use at about \$1.90 per pound. I have from the manufacturer's words that it would sell for 70, 80, or 90 cents a pound, in that range. They have not given us a firm price.

If it got down to the 70-, 80-, or 90-cent range, then you are talking about a 10-mile-an-hour capability, and I would assume the bumper probably would be in the neighborhood of two times the cost of the present bumper, and I don't have this exact costs, so I can't tell. That would be a measure of figuring it.

Mr. DOUGLAS TAYLOR. I would like to add something to that. For a five and five specification, if you put a decent set of bumper guards on the car, you will meet the 1973 Federal spec with zero damage to anything from barrier collision.

The high-strength bumpers are required only when you put the pendulum inputs into the car. If you are just talking barrier impacts, a good set of bumper guards, the bumper guards only pick up the barrier, you can use standard bumpers.

Mr. SUTCLIFFE. How much would the brackets cost that the shocks are attached to and then are in turn attached to the frame rings?

Mr. PAUL TAYLOR. I would say a safe guess would be double the cost of the units. Again this is for the old specification. You would be talking of \$25 for the whole assembly. You would have to double the price of the unit to include the brackets. I can tell you I think that is a little high. I didn't design all the tools, though.

Mr. SUTCLIFFE. So, you are talking about \$25 a car plus what might be required to beef up the metal between the units?

Mr. PAUL TAYLOR. Yes.

Mr. SUTCLIFFE. And you have said that the labor charge—you did in 4 hours?

Mr. DOUGLAS TAYLOR. I did it by hand. I would imagine the labor charge is as long as it takes the guy in the line to put in about six or seven bolts per unit, and I don't think that is unusually long.

Mr. PAUL TAYLOR. I would say it could be spot-welded along with the other spot-welding operations. I don't think it is an additional cost. Attaching the bumper is no different from attaching the present bumper so far as the labor cost.

Mr. SUTCLIFFE. So your best guess is \$25 for those things you know about, plus the possible additional cost to meet impacts other than a barrier crash by strengthening the bar that is suspended between the two devices that you would have on both ends of the car?

Mr. PAUL TAYLOR. I would strengthen the bumper enough to do the whole job. Every time you start putting pieces together, it costs money.

Mr. SUTCLIFFE. Now, you have testified that the Department of Transportation was aware of your technology prior to the promulgation of the standard?

Mr. PAUL TAYLOR. Yes.

Mr. SUTCLIFFE. You mentioned safety car work. Is this an experimental safety vehicle?

Mr. PAUL TAYLOR. Yes. We have talked to several of them.

Mr. SUTCLIFFE. What manufacturer was that?

Mr. PAUL TAYLOR. It is Ford.

Mr. SUTCLIFFE. Ford Motor Co.?

Mr. PAUL TAYLOR. Yes.

Mr. SUTCLIFFE. Are they participating?

Mr. PAUL TAYLOR. No, they are not participating. They are working on their own various safety aspects.

Mr. SUTCLIFFE. Senator, those are all the questions I have.

Senator HART. Gentlemen, thank you.

I repeat the impression that I am sure is shared by all who have been following these hearings, your testimony would suggest that dramatic advances can be made with existing technology, both to reduce injuries and death and property damage resulting from automotive vehicle use.

Without getting into any theological arguments about whose duty primarily it is to reduce death and injury, we resolve that question by the old bromide that it is everybody's, but some have to make steps earlier than others.

We are going to ask the Department of Transportation how come, given what you have told us today. They are suggesting that we wait until 1973 to do less.

Mr. PAUL TAYLOR. Thank you for having us.

Our car you saw in the movie is out at First and C Streets.

Mr. SUTCLIFFE. Mr. Taylor, if you will excuse me, the Senator would like to observe that procedure, and if you could wait until after the next witness has completed his testimony, then we could recess the hearing until 2 and see the demonstration.

Senator HART. Our next witness is a consultant in biotechnology and product design from California, Mr. Byron Bloch.

**STATEMENT OF BYRON BLOCH, CONSULTANT IN BIOTECHNOLOGY  
AND PRODUCT DESIGN, LOS ANGELES, CALIF.**

Mr. BLOCH. Senator, I would like to first express my appreciation for the opportunity to testify here today to present information on another safety bumper system, including a demonstration videotape showing the effectiveness of this safety bumper system which exceeds the proposed standards by the National Highway Traffic Safety Administration and those included within the proposed legislation, which is the subject matter of this hearing.

The safety bumper system that I am referring to is known as the INCA safety bumper system, and has been in development over approximately the past 6 years. From its original concept, there has been both test and feasibility hardware development, as well as pre-production hardware development which will soon lead to mass production manufacture.

In the interest of conserving time, I would like to skip the overview being read to the committee at this time and would like to instead herewith submit it in written form for inclusion as part of my testimony.

Senator HART. The testimony will be printed in full in the record.

Mr. BLOCH. I would like to point out that this INCA safety bumper system has been personally crash tested by myself, in a sequence of multiple impacts into a concrete barrier, in the Los Angeles area. These tests were in a 1971 Dodge Challenger equipped with the INCA safety bumper system—for the front of the vehicle—and I was wearing the standard lap-type safety belt. In addition, I have witnessed many other similar barrier impacts that have clearly demonstrated the merits of the INCA system; no visible damage to the vehicle, the reduction of deceleration loads to the vehicle occupants, and the automatic resetting of the system to enable repetitive impacts.

The barrier collisions were at speeds in excess of 5 miles per hour.

My original intention was to utilize the 1971 Dodge Challenger in producing the videotape to show to you. However, and as the previous witness also pointed out had occurred in his own tests, there was displacement of the engine and other components of the 1971 Dodge Challenger and in approximately 1 week's time, service garages were unable to make satisfactory repairs.

There were still problems of the transmission erratically shifting on its own volition, the muffler of the exhaust system had come forward so that it was essentially jammed against the right rear shock absorber, and there were other problems with other vehicle components as well.

So in the best interest of having an operable vehicle for the videotaping of barrier crash tests for this committee to observe, we changed from a 1971 Dodge Challenger to a 1967 Ford Mustang which, as some of the members of the automotive press know, has not been one of my favorite automobiles because of other reasons, including its front suspension design.

At this point, I would like to show the videotape and again in the interest of conserving time, I will show only that portion of the videotape which shows a series of barrier collision demonstrations of the INCA safety bumper system in action.

I appreciate the committee's acceptance of the text submitted here, plus additional information including reference to the relevant U.S. Patent 3,313,567 as a further description of the merits and components of the concept, system, and its embodiments.

Senator HART. We would like to see the videotape.

(Whereupon, a videotape was shown.)

Mr. BLOCH. Also, I have with me a letter that I would like to submit for the record, which states as follows:

On May 9, 1971, the undersigned conducted a series of barrier crash tests of the INCA bumper. The vehicle used was a 1967 Mustang. The tests were conducted by driving the vehicle into a solid concrete wall at approximately 5 miles per hour. The test was supervised by George C. Roberts, chairman of the INCA Corp. Videotaping and camera was accommodated by Harlan Bloch.

Incidentally, Harlan Bloch is a relative of mine, a cousin, and also he is the father of the two young ladies, Liza and Paula, whom you just saw in some of the barrier crash demonstrations, showing that one need not be either a professional driver or an astronaut in order to demonstrate the effectiveness of this safety bumper system in action.

The letter is signed by Mr. George Roberts and Mr. Harlan Bloch. I would like to submit this letter for the record, along with the photographic synopsis of what the committee has just witnessed on the videotape TV monitor.

Senator HART. It will be received.

Mr. BLOCH. Essentially, as the demonstration showed and as Mr. Roberts who provided the narration at the end of the videotape stated, the heart of the system is a purely mechanical energy-absorbing unit which consists of special belleville spring-washers which are arranged strategically within a strong, heat-dissipating cylinder. These spring-washers are essentially like pie plates, to make an analogy, in that they are slightly dished. Then by strategically stacking these components in series, some concave, some convex, it is possible to control the amount of energy absorbed at different velocities by different masses, as the vehicle impacts into barriers or other vehicles. Further, there is very minimal rebound, and the system will automatically reset itself and thereby be ready to absorb additional and repetitive impacts.

So, that is essentially the heart of the system.

The hardware assembly that you saw protruding from the front of the vehicle is for both demonstration and test purposes, as well as being able to adequately serve as an effective add-on system for many vehicles presently on the highways. The hardware can also be modified to approximate what is more akin to a normal-appearing bumper, as evolutionary developments that we are currently designing and developing, for both new and already-produced vehicles.

The safety bumper systems have concerned themselves, and correctly so, with minimizing property damage to the vehicle, and also with concern for reducing the deceleration forces to the human occupants of the vehicle.

A third category that I believe is also of merit and should be included in both the Department of Transportation motor vehicle safety standards as well as within the context of your bill, would also include minimization of injury to pedestrians in such pedestrian impact situations as might occur.

I would think the three basic categories would be: Reduction of crash damage to the vehicle, reduction of deceleration loadings upon the human occupants, and reduction of pedestrian impact injury forces that might be generated when such a vehicle were to impact into a pedestrian.

Senator HART. Yesterday Mr. Nader said that a rule has been proposed—it has been pending since 1967—with respect to exterior protrusions as threats to pedestrians; that even as of now the rule has not been promulgated. So, we will inquire of the Department the reasons for delaying that application.

Mr. BLOCH. Yes, there is correlation with safety bumper systems. I might also point out, and in the interest of time I would keep this very brief, that in my own professional activities, I occasionally serve as what the courts call an expert witness. It is not an ego-related term. It is a legally recognized term.

As such, I have testified in court, having analyzed various automobile accidents both for the plaintiff and initially years ago for the defense. In these efforts, I have assisted in the taking of depositions of members of the automobile industry, and have been dismayed and in some cases shocked at the lack of concern for a vehicle's frontal protrusions impacting into humans that may be struck crossing a street, for example.

I would like to cite this as only one of many examples in disputing some of the statements made yesterday that the auto companies do all they can to maximize safety. To use their own example of the Continental Mark III, I would like to very strongly point out the lethality of the front fender and bumper edges and protrusions of the Continental Mark III which Ford Motor Company testified yesterday was the kind of example to show that they are concerned with maximizing safety.

Also, to point out further evidence of the auto industry's tragic disregard for many safety aspects that should be taken into account in vehicle design, I would point to the "earmuff" roof designs and the "fast-back" roof designs that cause visual blind spots by reducing the effective rearward and rear-quadrant visibility, which thereby hampers backing into a parking space and lateral lane-changing on a street or highway, and thereby relates to potential collisions and resultant vehicle damage, which is of concern to this hearing.

So, by having these "blind spots" as typified by the Continental Mark III "ear muff" roof design and also by the Mustang "fast-back" roof design (which probably is one of the smallest effective rear windows of any Ford Motor Co. product in the past 10 years), I think we should also be concerned at these hearings with trying to reduce the insidious accumulation of vehicle property damage that can occur when the driver's visibility is reduced by unsafe roof designs and the inability to perceive the four corners of his vehicle, especially the two rear corners when backing up, in parking, or in lane-changing maneuvers.

There was a time, not too long ago, when the auto manufacturers proudly advertised the high degree of visibility that the driver had in their particular brand of car, including the driver's ability to see all four fender tips. Whatever happened to that safe and sane design criterion?

Since we are talking about occupant protection, I think it is very ironic, Senator, that the automobile industry, including auto safety specialists such as myself, have known for many, many years that stronger seats in our vehicles, coupled with built-in, inertia-reel retractable shoulder belts and lap belts, would be more effective—and would be much more inclined to be used by the general public—versus the present-day situation in which the lap and upper-torso safety belts are tacked into the car in an inconvenient, hard-to-use, uncomfortable, and shoddy manner.

So, I think it is rather ironic in the example that Ford Motor Co. mentioned, the Mark III Continental, which has no excuse for cutting costs for any safety equipment. Yet, the inertia-reel retractable belts which are used in military aircraft, in some commercial aircraft, in some race cars, and has been urged upon the auto industry by the various manufacturers of such equipment as well as by the auto safety community, has been callously disregarded being included.

Since one of the intents of the safety bumper systems would also be to minimize occupant injury, then improved safety restraint systems would help in that regard. I would hope the auto industry could greatly encourage the use of belts and harnesses if they were to include the inertia-reel retractable belt and harness systems and the stronger seats which are much more inclined therefore to be utilized by the occupants.

There are also other safety restraint systems, such as the so-called **airbag** automatic restraint system, that are worthy of diligent efforts to further develop and refine them as practical and effective systems for integration within all cars as standard equipment.

My own experience, by the way, includes the design and development and fabrication of the new and unique "Bio-Medical Automobile," which is essentially a mobile "mini-hospital" built within an automobile, to provide medical and health-care diagnostic, therapeutic, and emergency resuscitation services into and throughout the communities of America.

In addition, I've served as the research editor of *Road Test* magazine, as a professional avocation, in order to learn about and write about matters of auto safety, pollution reduction, design, value, and other consumer-interest aspects of the automobile.

I've also served as a consultant to help develop and upgrade the Kinematic safety seat system for automobiles, because I believe, as I still do, that such a system offers great promise for reducing occupant injuries in frontal-impact collision situations. Integrated within a comprehensive safety seat system and safety vehicle interior, and possibly cojoined with a compatible airbag restraint system, the Kinematic safety seat system is worthy of continued positive efforts by the auto industry and auto safety community.

I've mentioned these various aspects of my background to help indicate an experienced comprehension of the need for and merits of an effective safety bumper system—not as an island unto itself, but rather as a vital aspect of developing truly safe automobiles in a humane and comprehensive and realistic manner.

Senator HART. I am glad you made the comment you did with respect to the fact that this is an experimental example that you are showing and that the protrusion could be modified if it went into

production, because that was the first thing that struck me when I looked at it.

I thought, my God, we will be picking up pedestrians as we turn the corner.

**Mr. BLOCH.** Though the present bumper design will be modified in subsequent versions to also optimize that goal, the present hardware is nonetheless highly effective in reducing collision damage to the vehicle, as well as reducing deceleration effects on the occupants, which are two of the basic performance goals of any safety bumper system. Thus, the INCA safety bumper system is both effective and practical today . . . and can be readily installed on new and used cars today. Obviously, however, our continuous product development efforts will lead to various refinements and improvements in the evolution of the system and its components.

The heart of the system, and the point that should be focused upon, is the proven effectiveness of the energy-absorbing unit of the INCA safety bumper system. Because of the merits of such an energy-absorbing unit, the resultant safety bumper system is capable of absorbing and dissipating high-energy impacts, is itself of small size and mass and low in cost, has the desired minimal rebound after impact, and automatically resets itself after each collision impact.

**Senator HART.** I will ask why you estimate a consumer cost in the \$200 to \$250 range for a typical auto installation where the earlier witness described an absorption system that came for less than \$25.

**Mr. BLOCH.** In answer to that question, I would just like to add a brief preface.

When this INCA safety bumper system was called to my attention about 2 months ago, there were certain tasks that had to be assigned to the various handful of people that comprise the organization, with myself serving initially as a consultant and now as systems safety director to the INCA Manufacturing Corp., of Los Angeles.

The manufacturing costing was not one of the tasks assigned to myself, and so today I can best respectfully offer the information that is part of the documents that were submitted in quantity to your committee, plus another technical information document that has the part-by-part breakdown of processes and materials and costs.

In analyzing the part-by-part breakdown of costs, however, it would be of interest for the committee to know that this was in reference to very, very low volume—nowhere near the  $4\frac{1}{2}$  million units that have been discussed with previous witnesses, such as those from the auto manufacturing corporations. We were talking about only 5,000 and 10,000 units, and quantities of that sort.

Also, the component costs did not include amortization across such multiple units. The tooling costs per unit were also necessarily much higher than they would be in extremely high-quantity production of millions of units.

Thus, conditioned by these various facts and assumptions, my own estimate is that the energy-absorbing units could be mass produced in the multimillion category for under \$5 per each energy-absorbing unit. Therefore, a total vehicle that would have four energy-absorbing units would include approximately \$20 just for the four energy-absorbing units.

The related hardware that would protrude out from the energy-absorber units would then depend upon the particular design of the bumper, modifications to the vehicle structure, shock attenuation of various other components, and total integration within the overall engineering, esthetics, and manufacturability of the vehicles in high-volume production. I would estimate a manufacturing cost in the \$25 range for the energy-absorbers and related fittings, in multimillion production volumes for new vehicles. For low-volume installations on existing cars, inclusive of new bumper assemblies and installation costs, the cost to a consumer for a total system, front and rear, would necessarily and fairly be in the \$200 range.

Senator HART. Mr. Sutcliffe?

Mr. SUTCLIFFE. I have no questions. Thank you very much for your very interesting testimony.

Senator HART. Thank you again.

(The letter referred to earlier:)

INCA INDUSTRIES,  
Century City, Calif.

#### INCA SAFETY BUMPER TEST

On 9 May, 1971 the undersigned conducted series of barrier crash tests of the INCA bumper. The vehicle used was a 1967 Mustang. The tests were conducted by driving the vehicle into a solid concrete wall at approximately 5 mph. The test was supervised by George C. Roberts, Chairman of the INCA Corporation. Video taping and camera was accommodated by Harlan Bloch.

GEORGE C. ROBERTS.  
HARLAN BLOCH.

#### THE INCA SAFETY BUMPER SYSTEM

##### OVERVIEW

In automobile accidents, the collision forces that are generated often injure or kill the human occupants and damage the vehicle(s) involved.

The yearly toll of such tragic accidents now exceeds 55,000 fatalities. In addition more than four million total injuries are experienced, hundreds of thousands of which are crippling. The cost of this carnage exceeds an estimated six billion dollars annually in collision repair damage. The combined costs for personal injury, medical expenses, lost earnings, property damage, vehicle collision repair, insurance compensation, and related costs add up to tens of billions of dollars annually.

Most of the fatalities, injuries, and much of the vehicle damage can be attributed to automobile designs that are not "crashworthy". That is they do not absorb and dissipate collision impact energies in an acceptable manner as to preclude or minimize occupant injury and vehicle damage.

As frequently noted in Congressional hearings, including those on "Traffic Safety", "Motor Vehicle Safety Standards", "Prices of Motor Vehicle Safety Equipment", and "Automotive Repair Industry", the development of a safety bumper system is always referenced as an urgent and necessary requirement.

In recognition of this significant need for safety bumper systems, the National Highway Traffic Safety Administration (NHTSA) has recently announced a Federal Motor Vehicle Safety Standard applicable to new cars beginning with the 1973 models. The initial "Bumper Standard" specifies a nominal performance requirement for a 5 m.p.h. barrier crash test for front bumpers and a 2.5 m.p.h. test for rear bumpers.

The Standard's criteria for specific minimal damage to the vehicle's safety related equipment will provide a prime measure of the bumper systems performance and protective ability.

While the NHTSA intent is commendable, many critics have chastised the Bumper Standard as "too weak" and have urged raising the crash test criteria from the initial 5 m.p.h. level to a more meaningful fifteen or twenty miles per hour which better approximates the realities experienced in auto accidents. Another weakness of the Bumper Standard is that it is applicable only to new

cars (beginning with the 1973 models) thereby eliminating any standard for similar margins of safety protection for the approximate ninety million passengers cars presently on our highways.

As cited in the aforementioned Congressional Hearings analysis of all impact speeds in auto accidents, it was concluded that the average speed of frontal and rear collisions at the onset or instant of impact was a low sixteen miles per hour.

Because energy absorbing devices have been developed and are available to accommodate all safety criteria, there is no foreseeable reason why these products cannot be readily accepted for use in motor vehicles. Safety Bumper Systems must be efficient, economical and capable of being installed as a retrofit to existing and new vehicles.

#### SYSTEM DESCRIPTION

The INCA Safety Bumper System is a patented and barrier-crash tested energy-absorbing safety bumper system for automobiles and other motor vehicles.

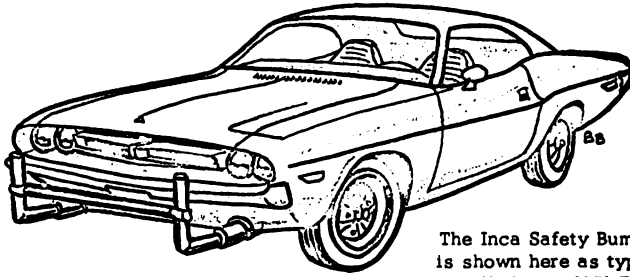

The basic function of the bumper is to absorb and dissipate the energies generated during collision impact, thus eliminating or minimizing damage to the vehicle and injuries to the occupants.

The "heart" of the system is a purely mechanical energy-absorbing unit composed of belleville spring-washer components strategically stacked within a strong, heat-dissipating cylinder. Two of these energy-absorbing actuators are rigidly mounted by adaptor brackets to the front stub-frame or frame of the vehicle. Projecting forward from each of the two actuators is a rigid tube which serves as a "piston" within each actuator. These tubes also serve as structural members to transfer forces from the "bumper bar" which is mounted outward and parallel to the vehicle bumper.

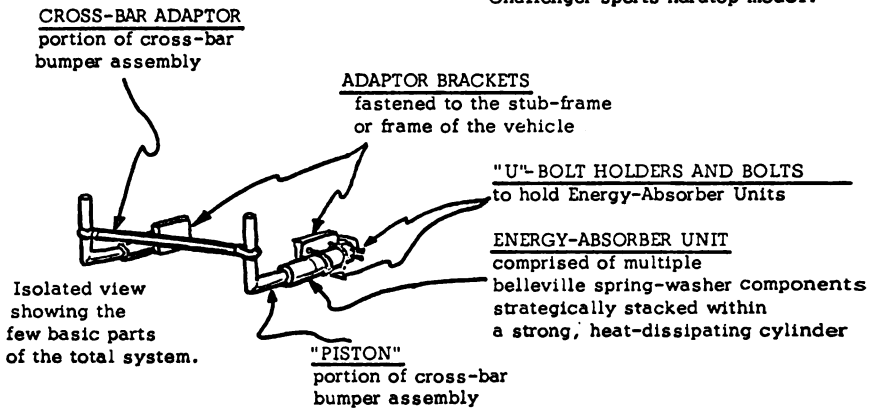

When a collision impact occurs, the "bumper bar" is moved toward the vehicle body causing the "pistons" to move into the energy-absorbing units. The compression of the stacked belleville spring washers severely distorts them within the confining tube. The distortion requires extremely high energy loads which dissipate as heat.

The INCA Safety Bumper System has a demonstrated barrier-crash effectiveness of approximately 15 m.p.h. with no overt damage to the vehicle and with significant reduction of applied deceleration forces to both the vehicle and occupants.

Projecting outward from each of the two energy-absorbing actuators is a rigid tube which serves as a "piston" within each actuator. These tubes also serve as structural members to transfer forces from the "bumper bar" assembly which is mounted outward to and parallel to the vehicle's own original-equipment bumper (which is retained as is).

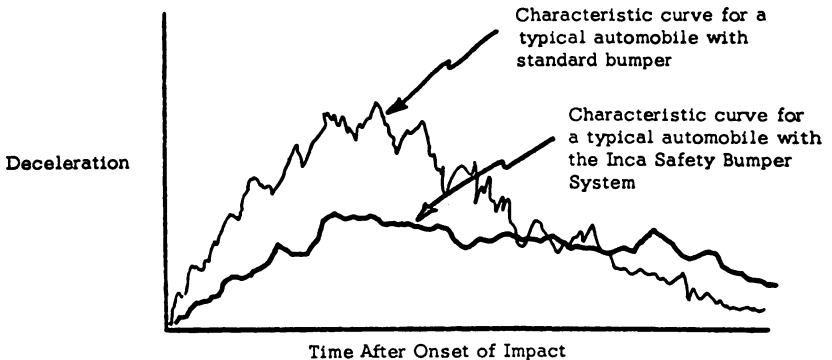

The Inca Safety Bumper System is shown here as typically installed on a 1971 Dodge Challenger sports hardtop model.

#### PERFORMANCE DESCRIPTION

The basic performance characteristics of the INCA Safety Bumper System is to reduce the severity of the forces transmitted to the vehicle occupants by "softening" the applied deceleration loads over a less-abrupt period of time.

Similarly, the INCA Safety Bumper System reduces the severity of the forces transmitted to the vehicle structure and significantly eliminates or minimizes physical and shock damage. The appended auxiliary bumper bar moves or reacts in a region in front of the vehicle fenders and body panels, providing additional measure of protection.

## ADVANTAGES

*Performance and Functional Advantages*

*Reduction of injuries to vehicle occupants* . . . by reducing the applied deceleration levels as the vehicle is abruptly stopped during a collision.

*Reduction of damage to the vehicle* . . . by absorbing and dissipating the impact energy within the belleville spring-washer units, the bumper aids in avoiding impact with the vehicle's body surfaces.

*Automatic resetting* . . . after a collision, the system automatically resets to its normal position with minimal spring-rebound. This feature permits multiple collision protection.

*Technical Advantages*

*Ultra-high reliability* . . . because it is essentially a purely mechanical system (and does not thereby include nor require any hydraulic, pneumatic, electrical, chemical or other components which would require periodic calibration, testing, adjustments, repairs or monitoring).

*High efficiency* . . . because of the high energy-absorbing and energy-dissipating character of the patented belleville spring-washer units, the total system is highly efficient, thus eliminating massive equipment, large displacements or heavy force-transfer structures.

*Compact size and light weight* . . . because of its inherent high efficiency in absorbing and dissipating impact energies, the belleville spring-washer units and other components are very compact in size and light in weight. Hence, the absorbers do not add any notable dimensional or weight changes, nor do they adversely affect road performance of the vehicle.

*Easily integrated within vehicle design* . . . due to modular design, with few basic parts and inherent simplicity, the system can be easily integrated within both present-day and evolving vehicle designs for the future.

For new vehicles, the belleville spring-washer units and force-transfer bumper assembly can be easily adapted within the structural and esthetic design of the particular vehicle as to blend within both the constraints of engineering and esthetics.

*Cost Advantages*

*Low cost of parts and installation* . . . due to the simplicity and efficiency of the system design and individual components, the consumer's cost will be generally in the \$200 to \$250 range for a typical auto installation.

*Reduction of vehicle repair costs* . . . approximately half of all collision impacts are in the range of 16 m.p.h. or less (at the moment of actual impact). The INCA Safety Bumper System eliminates vehicle damage at impact speeds up to the range of approximately 15 m.p.h. Subsequently, repair costs for the vehicle will be eliminated and greatly reduced at high impact speeds.

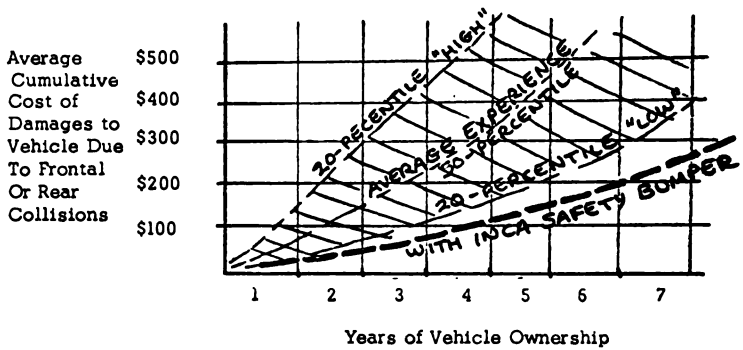

*Reduction of personal injury costs* . . . there are less severe forces applied to the vehicle occupants due to the "softened" or cushioned deceleration.

*Reduction of auto insurance costs and premiums* . . . as typified in the public offer by Allstate Insurance Company to reduce premium costs by twenty percent for those cars that could withstand a 5 m.p.h. barrier crash test with no resultant vehicle collision damage.

## REDUCTION OF REPAIR COSTS AND INSURANCE COSTS

The INCA Safety Bumper System can significantly reduce the collision impact damage to the vehicle, as well as reduce the injury-infliction potential to the vehicle's occupants.

Because of this capability, there develops a *cost-effective* rationale whereby the cost of installing an INCA Safety Bumper System will effectively displace and save the much-higher costs that would otherwise occur in any subsequent collision(s) resulting in vehicle damage and personal injuries. In a simplified way, this rationale can be graphically described as follows:

In addition to the savings realized in the cost reduction due to collision impact damage of the vehicle, there would also be a reduction of personal injuries and consequently, further reduction of associated medical expenses. In addition, insurance costs would likely be reduced to provide further savings (i.e., the Allstate Insurance Company offer to reduce insurance premiums by twenty percent for any car that can withstand a 5 m.p.h. front and rear barrier collision test without damage.)

The Insurance Institute for Highway Safety (IIHS), led by the former Director of the National Highway Safety Bureau (now the NHTSA), Dr. William Haddon, has sponsored collision tests which demonstrate the high cost of vehicle damage in low-speed crashes. The results of these tests may be summarized as follows:

#### VEHICLE CRASH DAMAGE—1970 MODEL SEDANS

5 m.p.h.—Test crashes conducted by Insurance Institute for Highway Safety showed that damage to the largest-selling 1970 sedans averaged \$217.55 at five miles an hour—walking speed.

10 m.p.h.—At 10 miles an hour—that's jogging speed—average damage was \$541.56.

15 m.p.h.—At 15 miles an hour, sedans crashing into test barrier suffered average damage of \$728.83.

Senator HART. We recess to resume at 2.

(Whereupon, at 12:20 p.m., the hearing was recessed, to reconvene at 2 p.m., this same day.)

#### AFTERNOON SESSION

Senator Moss (presiding). The subcommittee will come to order, and we will resume by calling Mr. Richard Chilcott, vice president, Family Insurance, Nationwide Insurance Cos., Columbus, Ohio.

We are very glad to have you, Mr. Chilcott.

#### **STATEMENT OF RICHARD G. CHILCOTT, VICE PRESIDENT, FAMILY INSURANCE, NATIONWIDE INSURANCE COS., COLUMBUS, OHIO; ACCOMPANIED BY ROBERT W. GRIFFITH, VICE PRESIDENT OF CASUALTY ACTUARY**

Mr. CHILCOTT. Thank you. I have with me today Mr. Robert W. Griffith, vice president of Casualty Actuary, and I would like to have him join me.

Senator Moss. Very good. I appreciate your coming too.

Mr. CHILCOTT. My name is R. G. Chilcott. I am a vice president of the Nationwide Insurance Companies. Nationwide's home office is in Columbus, Ohio, and we are the fourth largest insurer of automobiles in the United States.

I want to thank your committee for this opportunity to appear here to discuss our company's position regarding the automobile insurance system and the related subjects being considered by this committee.

We will be glad to answer questions on any aspect of the auto insurance business—now or later. But I will confine my prepared remarks to four subjects. They are:

S. 945, "The Uniform Motor Vehicle Insurance Act," which would create a partial no-fault auto insurance system in every State.

S. 946 which is designed to remove state restrictions on the sale of group automobile insurance.

S. 976 which is intended to promote the production of safe motor vehicles having greater resistance to damage.

And finally, I will briefly present for your consideration the Nationwide auto insurance reform plan developed by our companies.

I am pleased to say that Nationwide supports—without reservation—Senate bill 946 which would make it possible to market auto insurance on a group basis. In 1957 and 1958 Nationwide devoted considerable time, and executive manpower, in an effort to gain permission to market auto insurance through a true group plan.

Our efforts were not successful, but our interest in group marketing has not diminished. We fully endorse the bill that would make the economies of group sales, service, and loss prevention plans possible.

We also support, generally, Senate bill 976 although we do have some reservations about parts of it.

We favor the provision which establishes requirements for State motor vehicle registration and a uniform certificate of title program. We believe this would be a substantial improvement over the present system.

We also support the proposal that new cars can be tested against Government-developed safety standards, and that the results of the testing be made available to the insurance industry. But we have reservations about the provision which directs the Secretary of Transportation to determine how insurance companies use that information, and then to make recommendations for additional Federal legislation.

We believe, too, that it would be highly impractical for automobile dealers to attempt to provide useful and accurate information about the cost of auto insurance to their prospective customers. For example, in our home State of Ohio alone, there are over 300 separate companies whose rates would have to be communicated by the auto dealers.

In regard to the postrepair testing of automobiles, we suggest that the Department of Transportation be authorized to make further studies to determine whether such a program would be beneficial to the consumer when the costs of such inspections are compared with the possible benefits. We believe that not enough is known about how much defective replacement parts, or faulty workmanship, may contribute to highway accidents.

Turning now to the auto insurance liability system, we have studied many bills and many plans—including the Uniform Motor Vehicle Insurance Act. We find that there is much in this bill that we could support, and there are other provisions which we would recommend be eliminated or revised.

Specifically, here are some of the changes we would recommend in S. 945:

1. That the bill be expanded to include property damage, as well as personal injury, under the no-fault concept.

2. That automobile insurance be made the primary source of reimbursement for injuries or disabilities arising from automobile accidents—rather than a secondary source.

3. That reimbursement for loss of earnings be extended to age 65, rather than just for 30 months, and that disability benefits also be provided for housewives and other unemployed persons who may be accident victims.

4. That the provision for recourse to the liability system in cases of catastrophic loss be eliminated.

5. That benefits in the case of death be more tailored to the needs of survivors, and that these benefits be payable in equal monthly installments of a specified period.

6. That provision be made for the equitable distribution of high-hazard risks by spreading these risks among all companies through a reinsurance facility.

7. That the provisions be eliminated which would require a common, uniform statistical plan as well as standard policy provisions, classes of risk, and rating territories.

We believe that this also represents a step toward Federal regulation. We would much prefer a bill that would assure continuation of the established network of State regulation, but with provisions for broad Federal guidelines to establish reasonable countrywide uniformity.

As a matter of business philosophy—and, indeed, as a working principle—Nationwide has long supported a concept of self-determination and the decentralization of authority. We conduct our business that way.

Accordingly, we strongly support the position of the vast majority of insurance companies that the auto insurance business should continue to be regulated by the States, within the framework of the McCarran Act.

It is our judgment that State insurance departments should continue to provide direct regulation of insurance companies, but that they should allow a full measure of open competition. The primary concern of State insurance departments would be to assure maximum competition consistent with insurance company solvency and equitable treatment of policyholders.

This is not to say that the Federal Government cannot make a major contribution toward solution of current problems. Steps in that direction are being taken in some of the bills which already have been mentioned—such as those pertaining to group sales, to automobile safety and repair costs, and the vehicle registration and certificate of title programs.

Moreover, we believe that State regulation could be conducted within prescribed Federal guidelines adopted to encourage reasonable uniformity among State insurance laws or plans. We believe that the need for some uniformity is increasingly important at this point in time when many proposals for change are being made, and the adoption of different plans by different States could compound the problem.

While we believe that the Uniform Motor Vehicle Insurance Act is workable, it is our judgment that it does not go far enough in applying the no-fault concept.

We make this judgment on the basis of our experience, our convictions, and our extensive study and research.

As background, I would like you to know that for 9 years, Nationwide offered an auto insurance policy which gave the accident victim a choice of accepting guaranteed benefits, regardless of fault, or of pursuing his claim under the liability (fault) system.

Now on the basis of that experience, supplemented by extensive research, we at Nationwide have concluded that complete elimination of the negligence principle is the best solution to overcome some of the most pressing auto insurance problems—and their causes.

I will not dwell on those problems; this committee is quite familiar with them. I mention some of the major ones, only to put this report in perspective, and to remind you of the problems which the Nationwide plan seeks to remedy.

First, there is the question of whether the principle of liability—as it applies to auto accidents—continues to be valid in a society characterized by almost universal automobile ownership.

Second, the steadily increasing dollar costs of automobile insurance is of great concern. I should point out that some rise in costs will continue under any system as long as economic and accident trends follow their present direction.

Third, there is often delay and inadequacy in the recovery of economic loss from auto accidents, and some victims are not reimbursed at all because they cannot find a wrong-doer.

Fourth, the problem of availability of auto insurance to all car owners—or the lack of availability—in the open market is of increasing concern.

One way or another, most criticisms of the existing system are related to the liability principle upon which automobile insurance is based. Under the Nationwide plan, the liability system would be completely replaced by a compulsory first-party system. Policyholders would recover their auto accident losses from their own insurance companies. The owner of a car could not be sued by someone else as a result of an auto accident.

This is acknowledged as a point of contention. Critics of the no-fault concept argue that it relieves negligent drivers of their responsibility. But the fact is, under the present liability system, the careless driver is rarely held responsible or accountable in an economic sense. Actually, after a wrong-doer has been identified—often at great expense—he pays nothing. It is his liability insurance company that pays the bill.

What happens is that all policyholders chip in to pay the bill for the careless driver through the accumulation of premium dollars administered by the insurance mechanism. We share the public view that the wrong-doer should be punished. But we submit that punishment should be handled under the traffic laws. Insurance should not be a substitute for law enforcement.

It is illogical and unnecessarily expensive for the insurance industry to continue to spend millions of policyholder dollars to identify the wrongdoer when, in actual practice, the whole of society pays for the damage he caused anyway.

The Nationwide plan therefore disregards the question of fault in all respects. It is a compulsory system designed to make the injured party whole by taking care of his economic losses. Briefly, here is what it would do.

1. It would pay all medical expenses for as long as necessary. There is no limit on the amount.

2. It would reimburse victims for loss of wages at the rate of 85 percent of their regular earnings, up to 200 percent of the State's average weekly wage. Persons earning more than that average could buy additional income protection.

3. It would reimburse the victim for all other economic loss, including those expenses incurred for services he must hire someone to do because his injury prevents him from doing them himself.

4. It pays all necessary costs of rehabilitation, and provides incentives for the injured person to return to work.

5. It pays survivors benefits up to \$30,000. These are paid in monthly installments over a specified period.

6. It pays for property damage—up to the actual cash value of the policyholder's automobile, and up to \$5,000 for other property that may be damaged.

We believe this plan is entirely feasible and that it responds to the problems associated with the existing system of liability—that is, the increasing costs of auto insurance, the delay and inadequacy in recovery of economic loss, and the availability of protection. Here are examples of how the plan is designed to meet these problems.

1. As a first-party, no-fault system, the plan will bring about more prompt and timely payments for economic loss without the time-consuming and expensive delays associated with the liability system.

2. Because the benefits would be based on measurable economic loss, there would be a closer correlation between the amount of the loss and the amount of recovery.

3. Because the benefits would be associated with measurable economic loss, ability to recover would not be restricted to the liability limits of the "other driver's" auto liability policy. Each policyholder could obtain the amount of insurance he needs for his own protection.

4. Because all injured persons would be eligible for recovery, the plan directly meets the social problem of hardships resulting from delayed payments, or those in which the victim is not compensated because a wrongdoer cannot be found.

5. The first-party system is customer and consumer oriented. Because the customer would be dealing always with the company of his choice, the plan places a premium on prompt and efficient service.

6. The insurance product under the Nationwide plan would be available to all motorists. We would not have the tight market which is present today. This would be true because more applicants will be desirable to insurance companies than is now the case; there will be a narrower spread of rates between adult and youthful drivers and between metropolitan and nonmetropolitan areas; the reinsurance facility will broaden the voluntary insurance market to include all licensed drivers. The present assigned risk plans, or auto insurance plans, would be discontinued.

7. The plan should clarify the distinction between economic loss arising from auto accidents, and criminally irresponsible behavior which produces accidents. Under today's system, settlement of a loss by an insurance company often serves to absolve the wrongdoer from appropriate criminal penalty.

8. The plan holds promise of stabilizing the cost of auto insurance because:

It eliminates payment for pain and suffering, which cannot be identified as economic loss.

It eliminates that part of a settlement which does not reach the injured person because of legal fees.

It eliminates the expense incurred in connection with subrogation.

It reduces the expense of claims investigation, litigation, and arbitration.

It reduces the cost of the court system.

It gives impetus to the elimination of duplication of benefits which occur when payments also are made by various forms of health insurance.

We are under no illusion that the Nationwide plan will answer every conceivable problem associated with the automobile insurance business today. Every system has its imperfections.

We are quite conscious, for example, that some people will object to the elimination of payment for pain and suffering. We do not deny that pain is very real; and we know that accident injuries can cause considerable inconvenience and emotional reaction.

Under the present system, payments for pain and suffering are the largest single item of expense in compensating accident victims. Payments to injured people for pain and suffering amount to more than the reimbursements for hospital bills, doctor bills, and loss of wages all put together.

Eliminating this item should have beneficial effect on the cost of insurance coverage.

In addition, there is no equitable way to put a dollar value on pain and suffering. The amount an accident victim receives for pain and suffering—if he receives anything—depends too much on where the accident happened, the makeup of the jury, and even the persuasiveness and the forensic ability of legal counsel.

Payments are inequitable and in this sense the system is patently unfair.

There's one other consideration. It's true that a seriously injured victim may not be able to play golf, or to go fishing. But we submit to this committee that no amount of money would enable him to do those things if medical science is unable to correct the damage that has been done.

Money paid for intangible losses of this kind does not restore the ability that was lost.

We believe it is a much better thing that all injured people be reimbursed for actual economic loss—as they would be under our system—than that some people be reimbursed for economic loss, as well as for pain and suffering, and others receive inadequate compensation and sometimes nothing at all.

While our basic plan does not provide compensation for intangibles, coverage for such things would be available as an optional item at extra cost. Those policyholders who want to protect themselves against the possibility of pain and suffering in the event of an accident could buy this coverage. The amount of reimbursement would be on a fixed dollar schedule, and limited so that it would have some relation to the degree of injury.

Gentlemen, we have submitted to you only a brief summary of the Nationwide plan. Copies of the full plan have been provided for members of the committee, and at this time, Mr. Chairman, I request that the full plan be entered into the records of this hearing.

Senator Moss. Without objection, that will be done after your oral testimony.

Mr. CHILCOTT. Thank you, sir.

In summary, I want to say that we favor a bill which would permit sale and service of group auto insurance. We favor, with some exceptions, the bill designed to assure safer automobiles and lower repair costs. We believe the Uniform Motor Vehicle Insurance Act is workable but that it doesn't go far enough in applying the no-fault concepts.

And finally, we offer for your consideration the Nationwide auto insurance reform plan, which we believe to be superior to the existing system, and better than any of the other proposals for change that have come to our attention.

In our judgment, the Nationwide plan will do the most to resolve the problems associated with the present system.

Senator Moss. Thank you, Mr. Chilcott. That is a fine statement. Very specific and precise, and we appreciate it greatly.

It's most interesting to have a large insurance company like Nationwide come in with a plan worked out that is defensible and one that you have presented to us very clearly.

Where does Nationwide rank in size in insurance companies on liability?

Mr. CHILCOTT. We are the fourth largest insurer of automobiles in the country.

Senator Moss. Fourth largest?

Mr. CHILCOTT. Yes, sir. We saw you some few weeks ago when we were fifth, but we have the new records as of the end of 1970.

Senator Moss. Thank you. I congratulate you.

Mr. CHILCOTT. Thank you.

Senator Moss. And there are approximately how many insurance companies in the field? You are fourth largest out of how many? A good many?

Mr. GRIFFITH. I think close to a thousand.

Mr. CHILCOTT. I think over a thousand.

Senator Moss. At least, somewhere around a thousand? That's most interesting.

You advocate the inclusion of the property damage under the no-fault umbrella. Will such inclusion give a beneficial impact to the design of vehicles, do you think, and if so, why?

Mr. CHILCOTT. Well, I guess we'd like to hope so. We of course are hoping that the design of vehicles is going to be substantially improved in any event, whether they be paid for by insurance or otherwise.

The primary reason that we advocate inclusion of property damage is that in any change of this kind, people are probably going to be inclined to be thinking of the old system, so that if I have an accident where I strike your car, for some time ahead at least you would be thinking that you could recover from me if I was legally liable for your damage.

And if the system doesn't provide something to take care of the damage to your automobile—and this is why we would make it a compulsory system and include property damage—from which you would then recover from your own insurance company.

We could conceive of some difficult public reaction to this situation. In other words, if a person doesn't go about providing themselves with coverage for their own car, thinking they always drive carefully, and would never be at fault, and if they have a loss and there isn't some system by which they can recover that loss, we think that the public reaction would not be good.

Have I communicated the point?

Senator Moss. Well, yes. I am wondering, suppose a fellow has a very inexpensive car, all worn out, and he doesn't think that the property value is enough to even carry any insurance for himself. Is there any way for him to get out of it?

Mr. GRIFFITH. Under the proposal that we made, Mr. Chairman, there is no provision made for that. But any system of this kind is flexible.

Let me give you a few things that might be done to it. You might establish a dollar value under which it would not be necessary to carry compulsory collision insurance. Or you might use an age factor, any car over 5 or 6 years old, you wouldn't have to carry collision coverage.

I would suggest that if you feel that is a problem, it is very simple to modify the system to take care of that.

Senator Moss. That probably leads to another question I wanted to ask.

You advocate Federal guidelines to achieve uniformity, although the general administration of the system would remain with the States. Will these guidelines be mandatory, and how strict will they be?

MR. CHILCOTT. Well, this is a kind of difficult one. I guess the ideal situation would be for there to be a layer of a minimum coverage that would be required in some given period of time—say maybe a 3-year maximum or whatever was reasonable. This would provide the various States time to comply with the minimum amount of coverage to be made available to every motorist holding a valid driver's license. It would also provide time for the States to determine what additional coverage they feel the industry should make available to the public on an optional basis.

Senator Moss. There would be sort of a model bill. A minimum figure, that would be mandatory by Federal law, with States empowered if they wished to make it stricter?

MR. CHILCOTT. Yes, sir.

Senator Moss. Now in your testimony you state that the biggest cost of the present reparation system relates to payments for pain and suffering. How much of the bodily injury benefits paid are for intangibles losses of that sort?

MR. CHILCOTT. Approximately 60 percent of the payments under the bodily injury coverage.

Senator Moss. And how much of that gets through to the accident victim? How much do they benefit?

MR. CHILCOTT. Well, I guess that, Chairman Moss, will be determined a little bit by the part of the county you are in. I think it will range somewhere between 50 and 75 percent; maybe 67 percent being a fairly good average.

Senator Moss. I think the most revolutionary part of your proposal is the complete elimination of the reparation feature for pain and suffering. And I wonder if your rationale for this, since you advocate that the traffic laws be enforced is related to the pain and suffering a person experiences if he is a victim of another kind of crime, say a mugging on the street? He may get pounded on the head and have his head cut open and his vision impaired or something, and since the criminal ordinarily doesn't have any way to respond, he really gets nothing for that, does he?

MR. CHILCOTT. Yes, sir. And I think it's basically the same thing. When we started our study in 1967, the assignment to our subcommittee was that if we didn't have any system for automobile reparation that we have right now, with no system at all, what would be the best system to compensate the largest number of people for economic losses as a result of automobile accidents.

Now when the committee worked on that, they started looking for where these dollars are going right now. And in that analysis, and it was later supported rather exactly, or at least heavily supported by the Department of Transportation study, a large chunk of the money presently is being paid for the noneconomic loss that we referred to as pain and suffering.

And there is no question that it's a very real thing, but those same studies also pointed out that a good high percentage of the people weren't compensated at all.

They may have been negligent, and created their own loss, so to speak, or in some cases they found the other cars were not insured, or the person wasn't economically sound, so that there was no place for recovery.

So the point I am making is that in a good many cases, under the present system, they don't recover from pain and suffering, and secondly, we believe that this is a place where the consumer should have an opportunity—if a person is a piano player and has to have his hand, and he knows that, and he knows the possibility of accidents, we believe that he would purchase that coverage, as many of them who are in this profession do now.

Senator Moss. Just a regular insurance, outside of any vehicle?

Mr. CHILCOTT. Yes; it is a supplemental coverage for which he would pay an additional premium, and if he is injured in an accident he would receive \$100 or \$500 a week. This can be actuarially calculated quite easily and made available to those who felt they needed it.

But in order to keep the cost down, and reimbursement of the greatest majority of people for actual economic loss, something had to give, something had to come out, and we felt that is one that could come out and be supplied on a voluntary basis by a payment of an additional premium.

Senator Moss. Isn't contributory negligence a defense in most of the States now?

Mr. CHILCOTT. A great majority of them, although more and more in recent years they have been adopting the comparative negligence laws. But this is still true in a great many States; yes, sir.

Senator Moss. And for those States that still have contributory negligence as a defense, and it's a sizable accident, it's pretty hard to be able to withstand the allegation of contributory negligence; isn't it?

Mr. CHILCOTT. Yes, sir. Unless it's a very obvious case, where the car is stopped at a stop sign and struck from the rear or something like that. The answer is yes, it is in most cases.

Senator Moss. The DOT study indicated that only a third of the economic loss is recovered by the victim if the accident exceeds \$25,000.

Mr. CHILCOTT. Yes.

Senator Moss. In amount?

Mr. CHILCOTT. Yes.

Senator Moss. And so that is a very small part that comes through.

Mr. CHILCOTT. Yes, sir. And what I have said here in another way is that 66 percent—we believe that it's better that that 66-percent receive their basic economic loss than to have the smaller percent paid those much larger sums, especially since it would be made available to them if they wanted to pay for it.

We are really talking about an extremely small percentage when we talk about these unusually heavy losses. In 1968, for example, losses involving more than \$10,000 were 2 percent of our total losses, of the total number of losses reported to us.

Senator Moss. Only 2 percent?

Mr. CHILCOTT. Only 2 percent, and 27 percent of the dollars. So you see, we are talking really about a small percentage of the total people involved in the accidents.

Senator Moss. Well, it's very interesting. I think Mr. Sutcliffe said he had a technical question or two he would like to ask.

Mr. SUTCLIFFE. Mr. Chilcott, you discussed with Senator Moss the desire to mandate coverage for property damage. Can you give this committee information about any price differentials that would result,

that might be greater under a first-party system as opposed to a third-party, first-party combination?

Let me be more specific. We have received testimony that indicates that if you insured cars on a first-party basis, that any disparity between the cars as to the design for injury prevention either to the person or to the exterior of the vehicle, that any price differentials would be augmented, would be increased under a first-party mandated property damage system as opposed to a combination first-party, third-party liability system where the vehicle population, or the vehicle you are insuring was that vehicle and an unknown number of vehicles.

Do you have the information, have you collected any actuarial data to show what increase in price differential might result from a first-party property damage system?

Mr. GRIFFITH. Right off hand, I can't see any increment, but this was mentioned yesterday in the testimony—I believe it was a professor from the University of Indiana that presented it—if it would be possible for you to furnish us a copy of his testimony, we would be glad to submit a detailed response to it in terms of cost savings as we see it.

(The following information was subsequently received for the record:)

NATIONWIDE MUTUAL INSURANCE CO.,  
Columbus, Ohio, June 11, 1971.

Mr. S. L. SUTCLIFFE,  
Staff Counsel, New Senate Office Building,  
Washington, D.C.

DEAR Mr. SUTCLIFFE: This is a follow up to Mr. Chilcott's testimony before the Committee on Commerce. We agreed to review the testimony of Samuel Loescher, Professor of Economics, University of Indiana, concerning his theory that the consumer's preference for a car with lower damageability may be heightened under a first party coverage system.

We agree that first party coverage is more adaptable to offer rate incentives for safety features and lower repair costs because the incentive would be directly related to the consumers' own car. However, we differ with Professor Loescher as to the degree of incentive that can be offered.

The Nationwide policyholders who carry both coverages under the present system pay \$50 on the average for collision and \$30 for property damage liability on an annual basis. Thus, a discount on \$50 of collision premium in the present system would still be the major factor in a first party system discount.

Professor Loescher's point is more forceful in its application to personal injury coverage. Annually, Nationwide policyholders pay \$51 on the average for bodily injury liability coverage and about \$11 for medical payments or related first party coverage.

Thank you for the opportunity of commenting further on this matter. If we can provide further clarification, we will be glad to do so.

Sincerely yours,

R. W. GRIFFITH,  
Vice President and Actuary.

Senator Moss. That would be very helpful.

Mr. SUTCLIFFE. Thank you very much.

Mr. CHILCOTT. I want to be sure there isn't anything implied in your question. Let me make a statement. We do not feel that the system we proposed to you would cost any more than the present system. And we know it would reimburse a great many more people.

Mr. SUTCLIFFE. Yes, yesterday we had an exchange which was based upon some testimony that had been presented to the House, which said that suppose you give a discount for vehicles that have low sus-

ceptibility to damage, and say that discount is 20 percent of the premium rate on the collision coverage, if you went to a first-party system, you would be eliminating the bodily-injury liability part of the policy.

And the theory was that you would have a multiplier effect on the discount, so that instead of a \$24 indicator, of difference between car A and car B as to the property loss potential, that might be multiplied, as this professor said, by a factor of three, so that the price differential per year came out to \$72 a year, which was a larger indicator to the consumer, so that his preference for the car with the lower damage-ability would be heightened under a first-party liability system.

That is the kind of information I would like you to furnish to see whether or not that argument has validity.

Mr. CHILCOTT. I understand now the point you are making, and we would be glad to see what we could develop to give you some idea on that, at least an opinion on it.

Mr. SUTCLIFFE. Thank you. Now under your proposed plan, every insurer is required to write every applicant that it receives. In other words, it parallels the provision in S. 945 that requires you to accept every application of every insurer that has a valid license and hasn't committed fraud and pays the premium?

Mr. CHILCOTT. Right.

Mr. SUTCLIFFE. For the committee, would you at this point in the record explain the reinsurance program you have in mind, and how it would displace—as I assume it would—the assigned risk plans in the States.

Mr. CHILCOTT. Yes, sir.

Mr. GRIFFITH. The idea is shown in exhibit 2 of the report that you have. The fact is that in order to make sure that all persons who are entitled to auto insurance can get it without any difficulty whatsoever, we have to find a way to distribute the costs of the less desirable risks.

Mr. SUTCLIFFE. Are the assigned risk plans presently supposed to be doing that?

Mr. GRIFFITH. Yes, for the liability coverages only, and for basic limits only. This system of course goes well beyond liability since it includes of course the medical and collision insurance also.

We think people ought to have these coverages available to them.

Now to spread the risks of the less desirable drivers, those with poor records, we suggest a reinsurance facility so no individual insurance company would be hurt financially by insuring such risks, because it could be fully reinsured in the pool, and then all companies would take their proportionate share of whatever loss there might be in the reinsurance pool.

Mr. SUTCLIFFE. This would be a total reinsurance pool; in other words, each company wouldn't have a reinsurance applied to it above a certain level of loss, it would be total?

Mr. GRIFFITH. A total reinsurance pool.

Mr. CHILCOTT. The primary difference in the proposal we have and the operation of the present auto insurance plans, or assigned risk plans, is that you keep the public out of this consideration.

So that if I applied to X company for insurance, and I am a bad risk, I am accepted; and as far as I am concerned, I never know

that there is some kind of a facility by which these are distributed equally.

We think it will be a lot better from a public acceptance point of view.

Mr. SUTCLIFFE. In your prepared testimony, you mentioned that one advantage of the system that you propose, which parallels to a great extent the S. 945 before this committee, is that you would eliminate the expenses connected with subrogation or arbitration.

Could you be specific as to what those expenses are, because we have had testimony from other insurance industry representatives suggesting that their plans embodying subrogation or arbitration procedures also have a cost-effective savings.

Mr. GRIFFITH. This may be true. One of the reasons we recommend the complete elimination of the tort system is that it takes away any need to determine fault.

Now when you talk about subrogation or arbitration, you are talking about the fault system. And it is certainly much cheaper to completely eliminate all need for arbitration or subrogation than it is to simply modify the present system.

Mr. CHILCOTT. Some of the expenses incurred in the present system in subrogation, just the same as the rest of the liability system; and one of the things we were searching for was how to keep the expense part of the dollar down, too.

Mr. SUTCLIFFE. In that connection, could you supply the committee for the record as detailed an analysis as you can of what you think your plan would do to the allocation of resources under the present insurance system?

And if you would, assume a premium volume of \$14.4 billion, which the update of the Department of Transportation's study now pegs as the total premium collected, and we will also provide you the figures that we have for benefits paid out and principal economic loss and bodily injury and property damage information.

If you take those figures, and then for the record try as best you can analyze what the cost impact of the implementation of your plan would be on our present compensation system?

Mr. CHILCOTT. We will surely take a stab at it, yes, sir.

(The following information was subsequently received for the record:)

#### AUTOMOBILE INSURANCE, 1970

(In billions of dollars)

	All auto insurance	Bodily injury	Property damage
Premiums earned.....	14.4	6.9	7.5
Insurance overhead.....	5.0	2.0	3.0
Lawyers fees and other litigation expense.....	.2	.1	.1
Net benefits paid to cover bodily injury and property damage.....	9.2	24.8	24.4
Compensable economic loss <sup>1</sup> .....	12.0	6.5	5.5
Percent of loss covered.....	75.8	72.3	80.0

<sup>1</sup> Wage and medical loss, and future earnings of fatality victims with dependent survivors and property damage.

<sup>2</sup> Property damage benefits are reduced from the present system even though the proposed plan has a compulsory collision coverage. The reason for this is that, while all persons will have this coverage, it will have a deductible feature. The reduction because of the deductible is greater than the increase due to universal coverage. The net benefits for bodily injury are much greater than in the present system mainly because the plan will compensate all parties injured in automobile accidents for their full economic loss.

Source: Adjustments were made to data developed by the Senate Commerce Committee to estimate the working of Nationwide's plan.

Mr. SUTCLIFFE. We will appreciate having that kind of input. It would be very helpful to our deliberations.

You suggest that all coverages under the plan be primary?

Mr. CHILCOTT. Yes, sir.

Mr. SUTCLIFFE. On Monday, May 3, we received testimony from consumers Union suggesting that that decision be left open to individual consumers because some insurance coverages, in the health area particularly, have a higher cost efficiency benefit than present first-party coverages under the automobile compensation system.

He was talking about ranges of 90 percent efficiency as opposed to first-party coverages of 70 percent. Assuming differences in efficiency, would you allow for that consumer choice and only insist on primary coverage if you could assure that there would be comparable efficiencies between competing coverages?

Mr. CHILCOTT. Let me comment and then I will have Mr. Griffith comment too.

One, there is some expense involved in determining what, other insurance is available. And coming back to the point, one of our efforts was to try to pick out all of the expense money that was possible under this system.

So that if this is the primary coverage, we believe in the not-too-distant future, that the other types of coverage that might handle this loss would be revised or amended, or whatever, so that they became secondary coverage.

Mr. GRIFFITH. We believe that the automobile ought to carry the total cost of its operation. That is the reason the plan is built the way it is.

We also recognize that it would be extremely difficult to attempt to price a system where other benefits, other coverages or types of policies would come in first.

To be fair, you would have to consider on each individual case what accident and health coverage, Blue Cross, Blue Shield, medicare, was available to the individual applicant. And thus modify the price for each one of those individuals.

Furthermore, if after having done so, the man changes employment, no longer is eligible for group insurance benefits from his old employer, and then has an accident, he would find himself underinsured.

So we think it is far better to be sure that everybody recovers their economic loss, and, to do this, you almost have to make the auto insurance system the primary system.

Mr. SUTCLIFFE. Do you believe that your particular company can meet the efficiency competition of other insurance sources?

Mr. GRIFFITH. I am sure we could not meet the efficiency of, for example, the Social Security System, or group accident and health insurance where you have large groups.

But this is one reason we are favoring the group insurance law that you are proposing. Now, this would greatly improve the efficiency.

Mr. SUTCLIFFE. Have you considered the utilization of standard deductible approach for meeting the duplication of benefits problem, so that your cost problems of ascertaining different levels of coverage for individuals would be minimized?

Mr. GRIFFITH. That would help to minimize them, yes.

Mr. SUTCLIFFE. So that would be one alternative you might have in the way of primary-secondary problems?

Mr. GRIFFITH. Yes.

Mr. SUTCLIFFE. Did I understand you to say that your company would consider selling what in fact might be a first-party pain-and-suffering provision within the policy?

Mr. GRIFFITH. Yes; something, however, that would be definitely limited in sum. Perhaps geared to economic loss, perhaps geared to medical expenses, so it would be some direct relationship to the amount of pain and suffering.

Mr. SUTCLIFFE. So you would avoid the determination costs? You would fix that cost at the time the policy was issued?

Mr. GRIFFITH. Yes. Right.

Mr. SUTCLIFFE. And suppose that the pain-and-suffering part of S. 945 were amended to require this as an available option, would that be something that you think would be satisfactory?

Mr. GRIFFITH. That would be a big improvement, we think.

Mr. SUTCLIFFE. What do you do with the problem of disfigurement? We have constantly in these hearings heard about the disfigurement hypothetical, where you can't base it on any kind of a medical loss necessarily, but you do have something that many people feel should be compensated.

Do you have any response to the disfigurement hypothetical?

Mr. GRIFFITH. This is the same issue as all your intangible benefits. What is a true dollar value of disfigurement that cannot be corrected? None of us know.

Mr. SUTCLIFFE. Let me stop you right there. I guess you mean all costs connected with trying to repair any disfigurement?

Mr. GRIFFITH. Right.

Mr. SUTCLIFFE. No matter how long it took?

Mr. GRIFFITH. Correct. The rehabilitation effort includes all medical procedures to correct disfigurement, for example. Now when you get into such things as loss of limb, sight, hearing, if this is felt to be desirable, the health industry now offers coverage for loss of limb, sight and hearing, in specific dollar amounts, if they want to pay the premium for that type of coverage.

Mr. CHILCOTT. We would want to include this as an optional thing in any plan we would have.

Senator Moss. That is what I understand.

Mr. SUTCLIFFE. But you wouldn't mind it being treated as a mandatory option?

Mr. GRIFFITH. Right.

Senator Moss. Is Nationwide a member of the National Association of Independent Insurers?

Mr. CHILCOTT. Yes, sir.

Senator Moss. You then are not in agreement with the position taken by the association, is that right?

Mr. CHILCOTT. One of the privileges you enjoy by belonging to the National Association of Independent Insurers, Mr. Chairman, is that you are not bound by the policy or the decisions that are made in individual situations.

Senator Moss. Which is a happy thing. I'm glad to hear it.

Mr. CHILCOTT. Yes, sir. Now as a matter of fact, Mr. Griffith and another one of our associates participated in the development of the plan that has been offered by the NAII, and it's a fine plan, we think,

as far as it goes. We just—our difference with it is it doesn't go far enough.

Senator Moss. It doesn't go far enough?

Mr. CHILCOTT. Yes, sir.

Senator Moss. Senator Hart is here. Do you have any questions?

Senator HART. Except to thank the gentlemen very much for the tone of their testimony. Needless to say, it's encouraging.

Senator Moss. Thank you, Mr. Chilcott, and Mr. Griffith, for your very fine testimony. We appreciate your willingness to respond to the additional requests for information we have made. Thank you.

Mr. CHILCOTT. Thank you, Senator, for the opportunity to appear before you.

(The attachments follow:)

STATEMENT R. G. CHILCOTT, VICE PRESIDENT, FAMILY INSURANCE, NATIONWIDE INSURANCE COMPANIES, COLUMBUS, OHIO

#### PART I—STATEMENT OF THE PROBLEM

The existing auto liability insurance system has been the subject of increasing concern during the last decade. Nationwide Mutual Insurance Company has long been concerned with the type of system and insurance product that would meet the real needs of the auto owning public. Our concern has resulted in specific attempts to meet these public needs ranging from our revolutionary family compensation coverage introduced in 1956 to our action of adopting a five year guaranteed renewable auto policy in 1968. The family compensation coverage provided for payment for medical expenses and wage losses to all persons injured in an auto accident, regardless of fault, provided that those who had a right to payment because of the negligence of our policyholder would sign a release. This coverage was meant to supplement the legal liability system.

As another evidence of the company's concern for meeting the auto insurance needs of the public as well as answering the mounting criticism of the present system, a research committee was appointed to study the social, political and economic aspects of the existing auto insurance system. Prominent in the research group's efforts has been in-depth investigation of all the alleged shortcomings of the automobile tort liability system as well as the public and legislative criticism directed at insurance industry practices. This investigation included an examination of the many plans which have been advanced since 1930.

The research group has identified the major areas of concern as follows:

#### *I. The principle of tort liability as it applies to auto accidents and its continuing validity in a society characterized by the phenomenon of almost universal car ownership*

A related consideration is the increasing difficulty of establishing fault for auto accidents in these days of high powered automobiles and high speed highways. The following quotation from one critic of the tort system will serve as an example:

"The whole system of liability insurance rests squarely on the accepted premise that each individual should be held accountable for his misdeeds. I am sure this was recognized in human relationships long before the principle was formally set forth in law. It has worked well in criminal law because the individual can, indeed, be made accountable—by jail sentence if need be.

"It does not work so simply in automobile liability insurance. The fact is, the wrongdoer in an automobile accident is rarely held accountable in an economic sense. Actually, after a wrongdoer has been determined to be the guilty person, often at great expense, he pays nothing—it is his liability insurance company that pays the bill. What happens is that all society chips in to pay the bill for him through the accumulation of premium dollars administered by the insurance mechanism.\*

"It is not at least valid to ask whether the insurance industry should continue to spend millions of dollars to identify the wrongdoer when, in actual practice, the whole of society pays for the damage he caused anyway?"

\*In the public mind the wrongdoer should be punished. It is more appropriate that punishment be handled under the criminal law.

## *II. The steadily increasing dollar cost of automobile liability and auto physical damage insurance*

The gradual increase in the numbers of automobile accidents combined with the inflationary effect of almost every element involved in the evaluation of economic loss from automobile accidents has necessarily forced the price of both automobile liability and physical damage insurance upward in recent years. Although the public understands that the cost of repairing automobiles and the cost of repairing human bodies is steadily increasing, they are not happy when it comes their turn to pay their share of these economic costs. The public also realizes from their reading of the daily newspaper that numbers of automobile accidents are on the rise, but again, they are unhappy when they are asked to pay their part of these increased costs—particularly if they, themselves, have been fortunate enough to have avoided an automobile accident in the recent past.

Lest the point be missed, *any* automobile accident reparations system, whether it be the present system or some other, will be confronted with the need to finance payments for injuries and for damaged property. Economic losses from auto accidents under any system will steadily increase in the years ahead unless by some miracle automobile accidents become fewer, and such economic losses as wages, garage labor rates, hospital daily room costs, and doctor's fees decline.

The concern about rising automobile insurance costs has thrown the limelight on certain features of the present automobile reparations system. This is so because these costs are necessarily built into the insurance premiums which the public is asked to pay. Critics of the system make these points:

1. *Inefficiency.*—The process of determining fault under the tort liability system is often time-consuming and costly. Under the adversary system it is necessary that each accident be investigated by legally trained personnel to determine the individual responsible for the accident. Once fault is determined, the system calls for sometimes lengthy negotiation with the injured person in order to establish a dollar value of the injured person's losses. In case of disagreement, the courts are asked to make a final determination, both as to the issue of fault and as to the issue of damages.

2. *Cost of legal services.*—The tort liability system supports and fosters the provision for expensive legal services. In the case of the plaintiff, he must pay his attorney, usually on a contingent fee basis. For the defendant, there must be costly defense counsel which is usually paid by the defendant's insurance company which becomes a part of the expense that must be considered in setting the insurance rate.

3. *Excessive build up in medical costs.*—It is claimed that the present tort system encourages the build up of so-called "specials" because it is on them that the settlement for general damages on pain and suffering is based. Together, these increased medical costs and increased amounts for pain and suffering maximize the amount of the plaintiff's attorney's contingent fee.

## *III. Delay and inadequacy in recovery of economic loss from auto accidents*

The tort liability system provides no guarantee that economic losses resulting from automobile accidents will be compensated at all. Many injured persons or persons with damaged property are uncompensated because of their inability to establish negligence on the part of some wrongdoer. Others, where fault is questionable, may recover only partially for their losses or injuries.

Even where there is full recovery for both economic and intangible losses under the tort liability system, such recovery is often secured only after substantial delays. These are the delays inherent in the adversary system where fault must first be determined and finally the amount of damages established—sometimes via the judicial process. Even a delay of a few months works a substantial economic hardship on many accident victims.

It is claimed that there is a lack of reasonable relationship between the amounts of settlement and the extent of losses in automobile accident cases. Studies have consistently shown that relatively small claims are over compensated whereas accident victims involving substantial injury are often inadequately compensated.

Critics of the tort liability system emphasize that the uncertainty, the delay, and often the inadequacy of compensation imposes substantial hardship on members of the public and that therefore consideration should be given to some type of reparations system which is based on a no-fault principle.

#### IV. Availability of automobile insurance to all car owners

Tied in with the tort liability system has been the enactment of laws requiring car owners to prove they are financially responsible before they can operate their cars on the nation's highways. To protect society, such laws have been progressively strengthened over the years until today the vast majority of car owners find it necessary to purchase automobile liability insurance. Licensing authorities and the judiciary are often criticized for permitting dangerous drivers to continue to jeopardize the life and property of the general public. But because many of these dangerous drivers are still permitted to drive, the insurance industry is asked to provide insurance protection for them, often at substantially inadequate rates. In a free enterprise society, and particularly one where a substantial degree of competition exists, automobile insurance carriers must necessarily attempt to attract as customers the vast majority of car owners who are average or better than average drivers. The small residue of drivers who fall in the marginal category often find it difficult to secure auto liability insurance at standard rates. The insurance industry makes provision for insuring these drivers under the so-called automobile insurance plan, usually at rates that are grossly inadequate for this group of drivers.

A phenomenon of recent years has been the inability of insurance companies to secure adequate prices for their product in some states. The natural consequence of being forced to operate at an inadequate price is a tightening of the market for automobile insurance—forcing many car owners who were formerly considered average risks into the marginal risk market.

The lack of the availability of insurance, where it exists, militates against adequate protection of the public.

#### PART II—A PLAN FOR REFORM

##### A. A first party reparations system

It is clear that the criticisms of the existing system are overwhelmingly intimately related to the tort liability system upon which automobile liability insurance is based. This fact leads to the conclusion that the best long-range solution to the problem of assuring compensation to all automobile accident victims lies in the development of a system under which compensation for economic loss will be provided without regard to fault and on a first party basis between the insurer and the insured. In other words, the tort system, as far as its application to automobile bodily injury and property damage is concerned, would be eliminated and completely replaced by a compulsory first-party system. This means that policyholders would recover their economic loss from their own insurance companies. The owner of a car could no longer sue the person who caused the accident nor could he be sued by someone else.

The details of such a first-party system are spelled out in Exhibit I. In general, it is designed to make the injured party whole by taking care of his economic loss arising from:

1. Medical expenses—Unlimited.
2. Short and long-term wage loss—85 percent of earnings up to 200 percent of the state average weekly wage.
3. All other economic loss including expenses reasonably incurred for services in lieu of those the injured person would have performed without income.
4. Cost of rehabilitation (with incentives to return to work)—Unlimited.
5. Survivors' benefits—Up to \$30,000.
6. Property damage—Actual cash value for automobiles; up to \$5,000 for other property.

This coverage is designed to make certain that every person injured in an automobile accident can recover his economic loss. To accomplish this objective it is necessary that these benefits be made compulsory. This plan is designed to provide reasonable coverage at reasonable rates. For those who feel that they should have higher benefits, optional coverage at an additional charge will be made available.

The plan, as outlined, has several features which distinguish it from other plans. Some of these features are truly innovative.

1. The plan would be notably more comprehensive in conventional benefits than other plans have offered and hence would meet the criticism that too often the existing system fails to meet reasonably the total economic loss incurred. Examples of this greater comprehensiveness are to be found in the:

a. Unlimited payment for reasonable and necessary medical expenses, including that incurred in extended care facilities and for medically supervised home care services.

b. Payment for extended disability income up to age sixty-five.

2. A rehabilitation benefit would be included that, uniquely, would be an integral part of the benefit system and provides for cooperative procedures involving the claimant, the insurer, and bona fide rehabilitation agencies.

3. The plan uniquely provides incentives to return to gainful employment. This is accomplished by disregarding, in the computation of the benefits to be paid, a portion of the earnings in new employment.

4. The plan avoids the pitfalls of scheduled benefits by:

a. In the case of medical procedures, basing compensation on reasonable and necessary costs rather than on fixed limits per procedure; and

b. In the case of wage loss, incorporating an upper limit that will be automatically adjusted to the level of average weekly wages in the State.

5. Survivors' benefits are designed to serve during an adjustment or tiding-over period and hence, in the case of survivors of principal wage-earners or housewives, are payable in monthly installments; in the case of survivors of wage-earners, the installments are related to previous earnings.

The plan does not deal directly with the problem of payments received from other sources of insurance or wage continuation plans, etc. except for those provided under governmental programs which do not impose a needs test. Under current conditions, taking into account these other sources of duplicate payments would have very uneven, and a probably inequitable, effect. Furthermore, it would not be long before other systems would themselves preclude duplication as they now do with Workmen's Compensation.

#### *B. Competitive administration in a free enterprise system*

The Plan contemplates and, indeed has as an essential element, implementation through a competitive system of pricing, merchandising, and product development. The public interest is best served by a competitive system for the following reasons:

1. The best claims and other policyholder services can be expected to result from a competitive system. Each company may be expected to try to excel in providing policyholder satisfaction because such satisfaction is a principal ingredient of any company's program to grow and to increase its share of the market.

2. A competitive system will serve best to keep the price of the product at a level which will reflect most efficient administration. Specifically, it can be expected that companies will compete in devising:

- a. improved and more efficient methods of claim administration, and
- b. methods for reducing general expenses.

In this connection, it is important to recognize that the trend of increasing medical costs and increasing wages will inevitably cause the insurance cost of the proposed compensation system to increase. Competitive efforts to reduce costs (both expenses and loss costs) will help offset these inflationary trends.

3. Associated with the preceding point is the fact that experience demonstrates that under a competitive system a persistent effort will be made to achieve improved ways to relate premiums paid by policy-holders to the hazard insured. Competition assures a more equitable distribution of the cost of insurance.

4. A competitive system will encourage making available to the public a product that exceeds the statutory minimum. Examples of what may be offered are higher limits on wage loss (for the upper income groups), loss-of-use coverage under damage to property, and even, as suggested by Keeton-O'Connell, payment for pain and suffering.

5. It is basic to the free enterprise system that competition provides better regulation of prices, products, and services than that which can be effectively imposed by government. The concern of government should be to assure maximum competition consistent with insurance company solvency.

6. A plan providing for minimum statutory benefits under private competitive administration is in accord with the climate of current public and government thinking and practice; e.g., specialized products developed and produced by private enterprise under competitive bidding for governmental use. To duplicate in government the know-how already possessed by private insurance agencies would be wasteful and inefficient.

### *C. Equitable distribution of high hazard risks*

Every company and agent will be required to accept every applicant for insurance. High hazard risks will be insured under a standard, uniform rating plan established by the industry.

It is recognized that under any plan, there will be drivers whose loss experience or driving record will make them undesirable as insurance risks. These drivers will probably have to pay higher premiums under any system which allows competitive rating or classification. It is doubtful, however, that premiums charged to these poor drivers will be adequate to pay the losses they produce. There is, therefore, a need to provide for a method to spread the cost of insuring these high hazard individuals equitably among all individuals insured in a state. The basic principle to spread such risk will be reinsurance—in contrast to the poor arrangement of the assigned risk plan—so that the policyholder can be insured in the company of his own choice. Policyholders to be reinsured would be a different group than presently in the assigned risk plans. Present plans have many elderly, youthful, low-income, and military personnel drivers. Some of these, under the Reform Plan, would be acceptable at normal or standard rates. Relatively few risks would need to be involved in the reinsurance process. See Exhibit II for the outline of this reinsurance proposal.

### *D. Uninsured claim fund*

Acknowledgment is also given to the fact that compulsory insurance is never completely enforceable; hence an uninsured claim fund is established to provide benefits to persons who are not members of a car-owning family and who are involved in an accident with an uninsured automobile. A similar principle is applied to property loss.

### *E. Residual liability*

Assuming the enactment of this plan in a given state, it will be necessary to provide policyholders with a residual liability coverage especially for out-of-state driving where the tort system is in effect.

## **PART III—EVALUATION OF THE PLAN**

The Plan for Reform serves to meet the problems associated with (a) the existing system of tort liability, (b) increasing costs of auto insurance, (c) delay and inadequacy in recovery of economic loss and (d) the availability of protection, as they were reviewed in Part I of this Report. Features of the plan designed to meet these problems are:

A. As a first party, no-fault system, the plan lends itself to the prompt, timely, payment of benefits for economic loss without the delays associated with the adversary system. The tort system presents controversy as to the question of fault as well as the amount of damages. There may still be some controversy under the first party system as to the amount of loss but this should be minor.

B. Because benefits would be associated with measureable or ascertainable economic loss, there would be a closer correlation between the loss or damages and the amount of recovery. Thus, the plan avoids results which are now found where individuals with substantially the same loss are reimbursed with substantially different amounts.

C. Because benefits would be associated with measureable or ascertainable economic loss, ability to recover would not be restricted to the liability limits (or even existence) of someone else's automobile liability policy. (The effect of this limitation is particularly evident in coverage for the assigned risk, the underinsured, and the uninsured.)

D. Because all injured parties would be eligible for recovery, the plan directly meets the social problem created by hardships resulting from delayed payments or unmet losses arising from automobile accidents. Under a liability insurance system, it is the innocent third party who suffers when a car owner fails to carry insurance. Under the suggested first party system, failure to carry insurance penalizes only the car owner and his family.

E. A first-party system is customer and consumer oriented. It places a premium on prompt and efficient service. In addition, it enables the customer to deal with the company of his choice. Consequently, by replacing the adversary system and providing for the payment of benefits by the injured person's own insurer, a more wholesome relationship between the insurance industry and the public will result.

F. The public should find that the insurance product under the Plan is substantially more available to it than is the automobile liability product. This will be true because under the Plan:

1. More applicants will be desirable to insurance companies than is now the case. Examples of the more acceptable risks are the youthful, the elderly, and servicemen.

2. There will likely be a narrower spread in premium rates than exists today. It is expected that under a first-party system, the spread of rates between adult and youthful drivers—and between metropolitan and non-metropolitan areas—will be less.

3. The optional reinsurance provision for Special Class business will broaden the voluntary insurance market to include all licensed drivers and will remove the stigma of the assigned risk plan.

G. The Plan may serve a socially useful purpose in clarifying the distinction between economic loss arising from auto accidents and criminally irresponsible behavior resulting in accidents. To too large a degree today the settlement by an insurer of the loss serves to absolve the guilty wrongdoer from criminal penalty.

H. The Plan holds promise, in spite of compensating *all injured persons* for their total economic loss, of stabilizing the total costs of the existing system because it should:

1. Eliminate the cost now incurred for that part of "pain and suffering" which cannot be identified as economic loss.

2. Eliminate that part of settlements, included in the "pain and suffering" referred to above, which does not reach the injured person because of contingent fees.

3. Eliminate expense incurred in connection with subrogation.

4. Reduce claims investigation, litigation and arbitration expense.

5. Reduce the cost of the court system which now spends a substantial portion of its time on automobile accident cases.

6. Give impetus to the elimination, by various forms of health insurance, of duplication of benefits.

These reduced costs will be counterbalanced by the fact that the Plan will compensate many more people than under the present system simply because fault no longer has to be established to receive payment.

#### EXHIBIT I—AUTOMOBILE COMPENSATION COVERAGE

(This coverage would completely replace the present tort system for property damage, injuries and death arising from automobile accidents.)

This is a compulsory compensation coverage for property damage, bodily injury, and death resulting from automobile accidents. The coverage compensates for:

1. Collision damage to the described automobile and to other property (but not including other automobiles).

2. Injury and/or death to the insured and his dependents resulting from any automobile accident.

3. Injury and/or death to other occupants of the described automobile who have no coverage under their own policy.

4. Injury and/or death to pedestrians and cyclists who are struck by the described automobile and who have no coverage under their own policy.

5. Other out-of-pocket expenses, including paid help, transportation, and miscellaneous loss.

The coverage is payable without regard to fault and without regard to other forms of insurance except that it shall be excess over like benefits payable by Workmen's Compensation and by governmental programs which do not impose a needs test such as Medicare, Social Security, Veterans' Plans, and State Temporary Disability Benefits.

Coverage provisions are tied closely to rehabilitation services and are designed to encourage early recovery from serious injury.

The basic compulsory coverage is outlined below. Higher limits of coverage for extended disability income and for survivors' benefits will be made available for those who desire to purchase it.

#### DAMAGE TO PROPERTY

To pay for accidental collision damage to the described automobile and to other property (excluding other automobiles). Damage to the described automobile will be subject to a deductible selected by the insured. Damage to other property will not be subject to the deductible provision. The coverage limit on damage to the described automobile is its actual cash value; the coverage limit on damage to other property is \$5,000. Comprehensive coverage will be made available but will not be compulsory.

#### MEDICAL PAYMENTS AND REHABILITATION EXPENSE

To pay all reasonable expenses for necessary medical, dental, surgical, ambulance, hospital, extended care facility, professional nursing, and medically supervised home care services; to pay all reasonable expenses for necessary prescribed prosthetic devices; to pay for reasonable funeral costs up to \$1,000.

To pay all reasonable expenses not included above for necessary rehabilitation center services; for occupational, physical and speech therapy; for prostheses and other adaptive mechanisms, including training in their use; and for vocational counseling, pre-vocational training, vocational training or retraining, work try-outs and placement services. The company shall not be liable, however, for any costs of rehabilitation which are available and accessible from existing public or community rehabilitation services.

#### DISABILITY INCOME

To pay the benefits stated in the schedule below during the period of disability up to and including sixty days following the accident. The period of disability is defined as the time during which the injured person is unable to engage in his regular occupation or, if not employed, in those normal pursuits to which he is accustomed. The injured party must be under the care of a licensed physician.

#### EXTENDED DISABILITY AND REHABILITATION INCOME

To pay extended disability income stated in the schedule below, after sixty days from the accident and up to age sixty-five, if:

(1) The injured party is actively engaged in restorative procedures as recommended by the company which are reasonably designed to correct or substantially reduce his injury or to prepare him for a different and appropriately selected occupation for which he would not be handicapped;

(2) Both the injured party and the company agree to continue such procedures and so long as the injured party cooperates with bona fide rehabilitation agencies.

(3) The injured party is unable to actively engage in restoration procedures for good and sufficient cause.

In the event that the injured party assumes a different occupation at a reduction of income from his occupation prior to the injury, the extended disability income will be continued and will be determined by deducting two-thirds of the injured party's earnings from the income benefit.

Beneficiary	INCOME SCHEDULE	Income benefits
1. Person earning a regular income.		1. 85 per cent of weekly wage or weekly earnings up to 200 per cent of the average weekly wage in the state.
2. Housewife.		2. \$50 each week.
3. All others.		3. \$25 each week.

## SURVIVOR'S BENEFIT

To pay the benefits stated below for death within five years following the accident, payable to the surviving spouse or to a duly appointed representative.

<i>Deceased</i>	<i>Benefits</i>
1. Principal wage earner with dependent child surviving.	1. 100 per cent of three years' wages or three years' earnings up to a benefit maximum of \$30,000, payable in equal monthly installments.
2. Principal wage earner with no dependent child surviving but with spouse surviving.	2. 100 per cent of one year's wages or average yearly earnings up to a benefit maximum of \$10,000, payable in equal monthly installments.
3. Housewife with a dependent child surviving.	3. \$5,000 payable in one year in equal monthly installments.
4. Child under ten years of age.	4. \$1,000—lump sum payment.
5. All others.	5. \$2,500—lump sum payment.

(Where the deceased fits the description in more than one category, that category with the higher benefits will be applied.)

## UNINSURED CLAIM FUND

This fund will be administered by insurance companies designed to provide these coverage benefits for injury to persons who are not members of a car-owning family and who are involved in an accident with an uninsured automobile or automobiles. This fund will not provide coverage, however, to the owner of any uninsured car or to his dependents. All other injured parties will have coverage.

This fund will also be used to pay for damage to other property (excluding automobiles) where damage results from collision involving an uninsured automobile.

## EXHIBIT II—A REINSURANCE PROCESS TO ASSURE EQUITABLE DISTRIBUTION OF HIGH HAZARD RISKS

In order to broaden the insurance market to include all licensed drivers and to remove the stigma of the assigned risk plan, an "optional reinsurance provision for Special Class risks" is recommended. (Special Class risks are those high hazard individuals who, because of driving record, physical or mental disability, or some other personal characteristic, warrant special rating.)

Each company would be required to insure any individual who seeks coverage. The company would have the option to reinsure any individual from whom it had collected a Special Class rating under a standard, uniform rate plan established by the industry. All companies doing business in a state would be required to participate in the reinsurance losses or profit on the basis of each company's total car years of exposure to the total of all car years of exposure in the state. This would have the effect of distributing to each individual insured in the state an equal share of the cost which cannot, because of prohibitively high rates, be passed on to high hazard risk individuals. Since not all Special Class rating cases would require reinsurance, neither the individuals involved in reinsurance nor their agents would know who the reinsured cases are.

The insurance carrier would be required to cede 100% of the premium to the reinsurance pool. A commission equal to the ceding carrier's expense level, including loss adjustment expense, as shown in its insurance expense exhibit, or 30%, whichever is smaller, would be paid. Actual losses would be paid by the insurance carrier and recovered from the reinsurance pool.

In conjunction with the reinsurance pool, there should be an industry committee to work with regulatory authorities of the individual states. Machinery should be set up to review those insureds whose records would indicate the need to consider whether or not the individual should be allowed to drive. The committee would also be responsible for policing the industry and for establishing safeguards to prevent individual companies from abusing, or profiteering from the commissions in, the reinsurance arrangement.

Senator Moss. Mr. Warren J. McEleney, president of the Automobile Dealers Association, will be our next witness. He is accompanied

by Mr. Frank E. McCarthy, executive vice president. We are glad to have you gentlemen before us, and look forward to hearing your testimony.

**STATEMENT OF WARREN J. McELENNEY, PRESIDENT, NATIONAL  
AUTOMOBILE DEALERS ASSOCIATION; ACCOMPANIED BY FRANK  
E. MCCARTHY, EXECUTIVE VICE PRESIDENT**

Mr. McELENNEY. Thank you very much. My name is Warren J. McEleney. I am a Chevrolet-Oldsmobile-Cadillac dealer from Clinton, Iowa, and the president of the National Automobile Dealers Association.

As president of NADA, representing some 20,000 franchised new car and truck dealers, both domestic and foreign, I appreciate the opportunity to present the views of our association to your committee on S. 976, the Motor Vehicle Information and Cost Savings Act.

Our members are vitally interested in many provisions of this far-reaching piece of legislation. However, in the interest of time, I would like to direct my remarks primarily to those areas of most immediate concern to our dealers. The first item I would like to discuss is the odometer amendment.

Before taking up the original provisions of S. 976, I would first like to indicate our strong support for the adoption of an amendment to the bill, offered by Senators Magnuson and you, Senator Hart, and I want to add we are grateful for your interest in this legislation, which would provide for a Federal odometer law.

NADA has consistently supported governmental action, either by way of a Federal regulation requiring tamperproof odometers or by legislation which would prohibit the alteration of odometers with intent to defraud purchasers.

In 1967, the Federal Highway Administration announced that it was considering the issuance of a Federal motor vehicle safety standard specifying requirements for tamperproof odometers on passenger cars, multipurpose passenger vehicles, trucks, buses, and motorcycles. NADA supported their proposal at that time.

Since a completely tamperproof odometers has not been developed, such a standard has never been issued. Consequently, NADA supports the enactment of Federal legislation which would offer a national, uniform solution to curb the practice of tampering with or altering of odometers.

On April 29, Senator Magnuson and again, you, Senator Hart, offered an amendment to S. 976 which, we believe, would go far toward achieving this objective. The key provisions of this proposal would:

1. Prohibit the sale or use of any device which changes the mileage actually registered on the odometer, except for purposes of legitimate repair;
2. Make it unlawful to disconnect, reset, or alter the odometer or to operate a vehicle with a disconnected odometer with intent to defraud;
3. Permit legitimate service, repair, or replacement of an odometer as long as the recorded mileage remains the same or, where this cannot be done, posting written notice in the vehicle that the odometer has been reset at zero, the date of the repair, and the mileage indicated at the time of repair; and

4. Provide a method of certifying actual mileage on the vehicle upon its transfer.

The amendment would be self-enforcing by providing recovery of \$1,500 or three times the actual damages sustained, whichever is the greater. Court costs and attorneys' fees for successful plaintiffs would also be awarded.

The amendment would not infringe on State odometer laws except to the extent that the State laws were inconsistent with provisions of the proposed amendment. Criminal penalties provided under State laws would continue in force.

Senator Magnuson noted in his remarks when offering the amendment that consumers rely heavily on the odometer reading to determine a vehicle's fair value as well as to evaluate its safety characteristics based upon apparent use.

The adoption of this amendment would give a purchaser greater assurance that the mileage indicated on the odometer is an accurate representation of the actual mileage a vehicle has traveled.

Seventeen States presently have odometer laws, thus resulting in a patchwork pattern of State legislation. Furthermore, each State law has its own unique characteristics and penalties resulting in a lack of uniformity among the laws of these States. Given the mobility of motor vehicles and their interstate use, it is essential that some degree of equality and uniformity of treatment on a national scale be provided.

A Federal law would provide uniformity in the provisions, application, and enforcement of the law. As members of the retail automobile industry, our dealers have already experienced the undesirable effects which arise when one State has an odometer law and an adjoining State does not.

Similar problems develop when adjoining States have odometer laws with different basic provisions. The problem is simply this: A flow of vehicles develops into or out of a particular State either in order to avoid the application of that State's law, or to take advantage of the provisions of a different law.

Purchasers, including dealers, in States with odometer laws suffer when vehicles with altered odometers are brought into their States. They may pay inflated prices based on an inaccurate odometer reading. The irony is that the citizens in States with odometer laws are victimized by the failure of other States without such laws to curb this practice.

A Federal law which applies evenly to all will, we believe, benefit both customers and dealers alike. While the amendment may not solve all problems, it is an excellent start toward providing an equitable solution in an area which is presently a source of considerable frustration and unfairness. For this reason, NADA fully endorses the proposed amendment.

On the matter of property loss reduction standards, NADA supports the concept of reducing motor vehicle property losses as well as measures which will result in the increased safety and repairability of motor vehicles. However, we are concerned that the Secretary may not be able to develop and prescribe a meaningful system of tests and testing procedures designed to allow a determination and comparison

of the susceptibility to damage of passenger motor vehicles by July 1, 1972, the date which has been proposed.

We are also concerned that a hurried implementation of this legislative mandate may result in an increase in the cost of the motor vehicle to the consumer.

We fully agree with the bill's requirement that property loss reduction standards should be compatible with safety standards. Moreover, we contend that conflicts which may arise between the property loss reduction and safety standards should probably be resolved in favor of the safety standards.

NADA believes that the National Highway Traffic Safety Administration is the proper governmental unit to promulgate technical safety or property loss reduction standards and to evaluate the cost factor to the ultimate consumer. We recommend that Federal standards should preempt any conflicting State law or regulation.

Through its rulemaking procedures, the National Highway Traffic Safety Administration provides an appropriate forum for the evaluation of highly technical information which can be submitted by any party interested in a proposed regulation.

We believe that the Administration is in the best position to objectively consider and analyze the arguments concerning safety, property loss reduction, environmental, cost/benefit, and the numerous other factors which must be evaluated and coordinated in established individual safety and property loss reduction standards.

On the matter of motor vehicle bumper standards, NADA supports the concept of more effective bumpers for automobiles. We believe that economic benefits may accrue to the consumer by the development of more effective bumpers.

While NADA does not have the expertise to comment on the technical requirements of the energy absorption bumper standard proposed in S. 976, we believe that there should be national uniformity in all safety or property loss reduction standards, including those for bumpers.

We believe that a multiplicity of standards with respect to any component of equipment or area of design of a motor vehicle promulgated by more than one governmental authority could result in defeating the objectives for which such standards were developed. Specifically, NADA is aware of the Federal Motor Vehicle Safety Standard issued April 14 of this year, applicable to passenger car bumpers, as well as bumper legislation recently enacted in Florida and Maryland, and pending in many other States.

The bumper standard in S. 976 has been proposed to help reduce or eliminate costs to automobile owners resulting from minor collisions. NADA's concern is simply that the design and production costs generated at the manufacturing level as a result of the obligation of the manufacturer to meet several different standards may result in a net increase in the cost of the automobile to the consumer. We do not wish to see cost decreases offset by cost increases.

Again, NADA respectfully submits that the National Highway Traffic Safety Administration is the appropriate governmental unit for the promulgation of all technical standards applicable to the manufacturing of passenger automobiles and to evaluate the cost benefit factors to the consumer.

In the area of public information of test results, one proposed change in the National Traffic and Motor Vehicle Safety Act of 1966 requires that the Secretary compile and furnish to the public data submitted to him by the manufacturers to determine a vehicle's susceptibility to damage.

NADA considers it extremely important that any tests or testing programs to determine a vehicle's susceptibility to damage be developed and administered fairly. All pertinent factors should be analyzed in such testing programs and the results made public. This is absolutely necessary in order to insure fairness to the manufacturers and dealers who market these vehicles to the public.

NADA opposes the proposed provision which would require the manufacturers of motor vehicles to furnish prospective purchasers the results of testing prior to sale. We believe that such information should be made available through a third party such as the Department of Transportation.

Regarding the manufacturer's testimony yesterday about the problems that could occur in the testing of production models. I would like to point out that it would certainly be a major problem to the dealer as well, because of the time element involved in the testing.

So we support their request that pilot models might be considered for such testing if these requirements have to be met.

Periodic motor vehicle inspection. NADA supports periodic motor vehicle inspection because we are convinced that it leads to increased safety on the highway. Thirty-one States presently have periodic inspection programs. Eight other States have a random or spot inspection system.

We strongly support the provision in this legislation which would require inspection of motor vehicles whenever title is transferred for purposes other than resale and whenever the vehicle sustains damage to any safety-related equipment.

Many automobile dealers are presently equipped and staffed to perform inspection of vehicles and to operate sophisticated diagnostic equipment as contemplated under this proposal. In fact, automobile dealers, as well as other service repair facilities, are licensed to perform, and do perform, motor vehicle inspections under a number of the State systems which are presently in effect.

It would appear absolutely necessary to include automobile dealers in any plan to implement a nationwide periodic motor vehicle inspection system, if this system is to be fully functional and effective at the earliest possible date.

NADA opposes that provision of this bill which would prohibit any motor vehicle inspector from receiving any benefit in or from a business or enterprise engaged in the sale of motor vehicles, automotive repair parts, or accessories. Each State should have the option to develop a periodic motor vehicle inspection system which suits the particular needs of that State. States should not be precluded from licensing automobile dealers as vehicle inspection stations.

NADA supports the proposal which would provide assistance to States in establishing or improving programs of periodic motor vehicle inspection and motor vehicle registration.

In the area of insurance cost data to prospective purchasers, NADA recognizes the merit in providing customers with insurance cost infor-

mation. However, the insurance cost data with respect to a vehicle's susceptibility to damage is only one of many factors in determining the total insurance premium. Other factors which in our opinion are of even greater significance include the age, driving record, marital and family status, purpose for which the vehicle is being used, number of drivers, and the location where the car will be operated.

For the Government to require a dealer to furnish a prospective customer with only one of a number of variables involved in the total cost of insurance is to mislead the public.

Uniform title law requirements. NADA supports the proposal contained in this legislation for a State motor vehicle registration and uniform certificate of title program similar to the registration and title program contemplated by the Uniform Motor Vehicle Code and Model Traffic Ordinance. We believe the establishment of title laws on a national basis will effectively act as a deterrent to auto theft.

Furthermore, NADA urges that such a uniform title law include the requirement that all liens against a motor vehicle be recorded on the face of the certificate of title in order to facilitate the transfer of title between vehicle owners and vehicle purchasers.

We thank you for the opportunity to present our views before this committee.

Senator HART (presiding). Thank you very much, Mr. McEleney. I am delighted that you are stating so strongly support for the odometer aspect of the pending legislation. You make a point that sometimes is lost in the shuffle I think, that even a State which has attempted to protect dealer and consumer by enacting the odometer bill is trapped and punished if a neighbor has open season and the car is driven across the line; you are hurt as a dealer in the first State, you are taken as a dealer in the second, and the consumer in the first State who is thought to have been protected is done a disservice, and the consumer on the other side of the line is stuck, too.

So the thing has a nice symmetrical balance to it. It makes sense from every point of view I think.

Mr. McELENNEY. We certainly think so, Senator, and that is why we are so actively supporting this legislation. We think it will clean up an area that needs a lot of cleaning up, Senator.

Senator HART. I hope at least this much, we can get promptly on to the law, because a lot of the problems that confront us admittedly are different in solution, but it seems to me that this is a manageable problem.

Ideally, when we drew this bill with respect to inspection stations, again the symmetry is great, let's have an inspection testing service that is unrelated to any merchandising or repairing place. Let it be unconnected to anything like that, and as I would anticipate you say no to that, you feel in order to put an inspection program on the road at the earliest possible date we would have to include in the inspection system dealers and other places that are now engaged in repair work and sale of replacement parts.

Can you suggest any requirements or limitations that would eliminate the abuses that obviously could be there? Is there any way to reduce the temptation without ruling out of bounds the repair shop or the dealer or the garage?

Mr. McEENEY. At first thought, Senator, I imagine the strongest way to obtain compliance by everyone would be to put some form of penalty on any abuse of the program by the licensed station. I might add that many dealers today have heavy investments in diagnostic equipment. I recognize the fact that much of it might have to be tailored to comply with the program which might be established on a nationwide basis. But nevertheless the fact remains many dealers already have this equipment in their operations and are staffed and in a position to proceed.

I am thinking primarily of States where there are no periodic motor vehicle inspection laws today. I realize the States that have them have automobile dealers and other repair stations licensed to perform these inspections.

I know I am deviating a little bit from your question, Senator, but I have to say this, there must be a pretty strict policing of this in the States where they have periodic motor vehicle inspection, borders the State of Illinois, where they do have mandatory inspection of trucks—not passenger cars. It is a very strict law and it is adhered to very closely not only by residents of Illinois but by those of us who operate vehicles in the State of Illinois, such as my service trucks and so on. It is very strict, and these include repair stations operated by dealers.

Mr. McCARTHY. I might add one thought, Senator, and that is in the inspection performed by any repair facility I certainly think the person having his automobile inspected should be free to have repair done any place. I recognize this will not in itself cure the abuses that you and we are concerned with, but it does provide some protection to the automobile owner that if he feels that the inspection report or the person performing it is not really up to par, then he would be free to take it to another repair facility.

Senator HART. We would not be able to make a trade here, that you permit a dealer to inspect but have the law prohibit his doing repairing?

Mr. McCARTHY. We have actually thought about that, but we did not believe that would lead to curing the problem.

Mr. McEENEY. Yes, that was under discussion.

Senator HART. It is to your credit that you even thought about it.

You say on the business of giving the customer insurance cost information for the Government to require a dealer to furnish a prospective customer with only one of the number of variables involved in his total insurance cost is to mislead. I would suggest really the only variable to the customer is the item of the vehicle's susceptibility to damage and its relationship to insurance, because he is always the same age, he is always the same father or father of the irresponsible 22-year-old or whatever you want to call him.

Mr. McCARTHY. Maybe a better way to put that Senator—I recognize your point, but in arriving at the cost of the insurance premium, it is our feeling that the insurance cost data with regard to the vehicle would be rather insignificant in comparison with the elements that these other factors we mentioned would contribute to an insurance premium.

Senator HART. To the extent that we can provide him with information that is understandable and relevant we should try.

Mr. McEENEY. There are some variables too, Senator. For instance, the age does become a factor when they go into a different age bracket

as far as the insurance companies are concerned. I think the fact that a man that is picked up while intoxicated, say yesterday, certainly alters the likelihood of his obtaining his insurance the next year at the same rate. I think there are some variables that enter into this picture besides the susceptibility to damage that would affect insurance cost information.

Mr. McCARTHY. On this question I would like to raise a few questions which I hope will be helpful. In the bill itself, it is not clear as to what exactly is meant by insurance cost data, as to whether this means an element of premium or some other type of rating system. That is not particularly clear. We also are not sure whether this will be limited to new cars only or whether it may be extended to any car sold by a dealer. And if such information were required, being consistent with our earlier statement, we would prefer that the Department of Transportation make this information available to the prospective purchasers as they are attempting to do in their other areas of automobile information disclosure.

Senator HART. I guess the next to the last point I would raise with you involves the section for the providing of test result information. You say that we should not require the manufacturer to give to you and you to provide the prospective buyer the results of testing, and you suggest that a third party such as the Department of Transportation do it. Our problem is we have already attempted to make available to the buying public information from the Department now. You know, it is in that book that occupies space in every showroom, I am sure, but does not get much use, and you can explain that in a variety of ways.

But if, and I understand you recommend against this, but if in the distribution of automobiles the test information was required to be given by you to a prospective buyer, you have Olds, Cadillacs, and Chevrolets, if several models of Chevrolet in a model year were way down the list of desirables under this test, wouldn't you put the heat on Detroit to improve the performance under tests of that model? Isn't there at least some encouragement to upgrade performance standards if we do this? I understand you do not want us to.

Mr. McEENEY. I understand that, Senator. Let me answer it in this light. I realize the competitive situations that could be a result of this procedure, and I recognize that; however, I think that there are many ways in which the public—and I cannot give you ways off the top of my head right now—but I would think someone would find ways to circumvent this program somehow at the retail level, Senator. That is just a conviction I have on it.

For instance, let me give you some personal experience, and again you have touched it. But let's take the booklets that are provided to the customers today in the glove compartment of the car, and I am talking here about the stopping distance, the load factor as far as tires are concerned and so on. I can give you this from a firsthand experience, and we are a fairly large dealership—we sell approximately 1,100 new cars a year. I have yet to find a customer to request this information.

We have provided it voluntarily, and seeing the lack of customer interest or consumer interest, I do not know, but I would almost be inclined to say that I think you might even have the same situation with this test result information on the part of the consumer.

I guess that is just what I am relating it to from our past experience in the other area. It is a difficult one. Naturally I am biased. I have to

say that in all candor with you. While it could be a detriment to us in a certain year, it could be an asset in another year, I recognize that, and it does provide again the competitive situation that I guess we would all like to see develop. Hopefully the manufacturers will take on this challenge voluntarily, Senator, but that is the only thought I can express at this time.

Mr. McCARTHY. On this topic I would like to note an earlier point, and that is before such test data is made available to the public, we would hope it is representative data, that you just not pick one item which a certain series of cars would fail badly, while other cars would score well. We would hope it would be representative of the vehicle so it would be a fair comparison.

Senator HART. We would want it to be.

Mr. McELENENY. I guess you can relate to that the performance cars. There are a number of tests evaluated on automobiles in January every year in the Florida races. Some cars may have a certain weakness in some areas as to performance while they stand out in others, which gives you a rounded out picture.

Senator HART. Well, certainly not just out of curiosity, but to get a dealer's point of view, do you think you would be able to sell more cars in the next 30 days if you had them equipped with bumpers such as we saw this morning than you would without them? Do you think it would make any difference? Did you see those?

Mr. McELENENY. Yes, I did this morning, and quite interesting I must say. Senator, I am going to draw on my experience in the past and the apathy on the part of the consumer when it comes to a lot of this material on automobiles. As an example, I can refer to shoulder belts. A very, very small percentage of people buying new cars today will ever take that shoulder belt off the receptacle that it is in when they get the car. It is usually only when they trade it off. I think a similar experience might prevail here. That is a hard one to answer. I think what you are doing is assuming the cost information that was given to us this morning, but even with say a \$40 or \$50 add-on, I question the customer's interest in purchasing this for his automobile.

His attitude I think in a lot of cases would be, "this won't happen to me," and that is the apathy that I speak about.

I might even go back into the air emissions system on automobiles today. Frankly there is very little customer interest in maintaining your air emission systems on automobiles today. That bothers me a great deal. We can put all this equipment on automobiles like the bumper and the passive restraints and so on that are looked for in the years ahead here and the air emission controls, which are fine, and I know they are needed, but we must somehow either educate the public or train the public or convince them that the servicing of these units where there is servicing required has to be done or should be done. But there is a complete lack of interest.

I know of one program, for instance, and I am sure you are probably aware of it, General Motors' test out in Phoenix last year where for a limited period of time, at least long enough to see if it would be picked up by the public, where the air emission controls were available for older model automobiles at a very reduced price, and the result was a very decided lack of interest on the part of the public. I think this is what happens in all of these areas frankly.

Senator HART. At this late hour in the afternoon I won't ask you your opinion as to what does persuade us—I am a consumer—to make our shopping decision on cars. Apparently you are suggesting our sights are not as high or our understanding as broad as it should be.

Mr. McELENEX. No, Senator, I think it is broad. I am not trying to say that at all; I am concerned, and I guess we can all express opinions and yet at today's writing I do not think any of us can really support anything with enough factual information. But I am concerned about the retail price of automobiles in the next 3 to 4 years as a result of all the regulations and legislation coming forward. I really am, not only as a retail automobile dealer, but I am concerned for our whole industry, because I think it could have a very detrimental effect, and yet I recognize the need for some of the things that are regulated and also legislated. But there has to be a balance somewhere. Where that balance is I do not know.

You asked a question a moment ago, and I do want to offer this thought. I think styling or change, Senator, is still a big factor in persuading people to change or buy automobiles. I think, too, that recognition ought to be given to the attempts of the manufacturers on a voluntary basis to provide added safety equipment and innovations in the way of safety over the past 4 or 5 years.

I recognize, too, that legislation and regulation has probably prompted some of this. This is an area of concern to me as a retail automobile dealer. Are we taking away the ingenuity and probably the voluntary action on the part of the manufacturers to come up with new ideas in the area of safety equipment by the regulation and the legislation that is being forced upon this industry? I am concerned about it very much.

Not to inject personalities, but my whole background is automobiles. I am a second-generation automobile dealer. We have a large investment in my area, in a retail automobile facility. I have sons coming into the business. So I am very concerned about what happens here, what happens over at DOT, what has happened at the manufacturing level, and that is why I have a deep interest in our association, because of the future in the business.

Senator HART. All of which is understandable.

Mr. Sutcliffe.

Mr. SUTCLIFFE. I have no questions.

Senator HART. Did Mr. McCarthy have anything he would like to add to that?

Mr. MCCARTHY. No, sir, Senator.

Senator HART. He has followed this legislation very attentively.

Mr. MCCARTHY. Thank you very much.

Senator HART. Gentlemen, thank you very much.

Mr. McELENEX. We want to thank you, Senator and Mr. Sutcliffe, for having us.

Senator HART. We adjourn to resume at 10 o'clock tomorrow morning in this room.

We would anticipate first hearing Congressman Eckhardt, Dr. Haddon second, and we will move Mr. Kemper up because I understand he has some late afternoon schedule problem. Mr. Pradko and his associates, Mr. Noettl, and then the delegation from Maryland led by Mr. Johnson.

(Whereupon, at 3:30 p.m., the hearing was adjourned, to reconvene at 10 a.m., Wednesday, May 12, 1971.)
